The sire is usually the most neglected animal on the ranch, and then we wonder why his usefulness departs at say six or seven years. This is wrong, for an animal that has proven his worth should be more valuable as he grows older rather than less valuable. The best Percheron stallion I ever saw was old Huber; at twenty he had the life and style of a colt and transmitted it to his colts. I have a number that can be picked out anywhere from the rest of the colts by their vigor and action. The best of dairy sires, the one that gave the greatest vigor and breed character to the calves from common stock cows, that stamped the dairy form indelibly on all his get, was old Beauty Prince, and he was good to his untimely death at nine years. I think the secret is in exercise; he was always in a large corral and played constantly. The half barrels that held his water or feed he often wore on his horns for a bonnet while he raced around.

In selecting a calf, see that he shows the rudimentary teats, and see that he has strength, a good backbone and a good-sized stomach. He should be muscular rather than fat and have the dairy form. The head needs to be that of the male, bold and independent. Shoo him up in the lot and see if he runs and then has courage to turn and face you; I do not like to see them run clear away.

The feeding should follow the same lines as that of the heifers—skim milk, flaxseed, meal, oats, alfalfa hay and silage. Keep him growing, but not fat, as he must not transmit the faculty of putting fat on the back. Next comes the education, that first begins by restraint. It is convenient to apply it by the use of a stanchion to feed him in and then to leave him in it for a short time. With a halter made strong enough to hold him lead him around. Of course, he will object, but have a second man with a carriage whip behind, then start up, if he comes all right; if not, then a sharp tap of the whip will send him forward; walk him around and tap him every time he fails to move promptly. Later lead him from horseback, and if there is a small treadpower let him turn the separator or pump the water. Exericse, regular and prompt obedience should be required of him from the time he is a yearling, and it will last all through his life.

When he is two years old the time to dehorn has come. This done with the clippers is quickly over and the danger of goring anyone is passed. The trouble with having a well-trained bull is that everyone thinks of him as a horse or other domestic animal and forgets that there is an underlying temper that may light into a tempest when least expected, so that the horns should always come off—every one of them—at two years old. Never allow the full-grown animal to be handled without the staff hooked into his nose ring and a good halter on his head; leading with the halter and holding him away from the man leading him with the rod.

I have found that silage is as good for the sire as it is for the cows, and that thirty pounds a day, with twelve pounds of alfalfa hay, keeps him in good sleek condition. When in use give him six pounds of corn chop and shorts mixed, two parts corn to three parts shorts, changing the corn to barley sometimes; but they really need but little grain, except when they drop in condition. Silage seems to keep them in better condition than other foods; it seems to be digestible and appetizing as well as satisfying to the bovine stomach. The best criterion of health in cattle is the condition of the hide and hair; if it is mellow and smooth and handles oily under the fingers, the animal is thrifty; if harsh and rough, the animal lacks in condition.

If all would only realize that an old sire has value because of the known value of his offspring, and that with care he can be made to see his seventh generation of descendants around him, while still full of vigor, greater care would be taken of him. The value of many animals is lost by making them fighters, so that they are butchered for the sake of safety. I think that ferocity in the animal results more from the habit of hitting him over the head. If no one every corrected him except in the rear, and with a whip that stung rather than bruised, he would be less hard to manage. Use the whip on them while they are young in teaching them to obey. I have usually two aged bulls on the ranch, and when they are turned out in the pastures no one fears them, for the waving of a yellow switch at them will turn them, while they lead off in front of the person on foot, thinking they are to go ahead. Yet these same animals turned and fought hard when a stupid foreman I had last year thought he would rope one of them. The toro was too much for the man and horse; both went down in the dust. Old Manuel walked down and said, "Shoo, shoo," and the terror walked into the corral at the tapping of a cottonwood switch on his rump. On the ordinary animals I do not believe in the use of a whip at all. Cows, horses and dogs are like children in, of course, a lesser degree; they only need to be loved, coaxed and gently patted into doing right.

You need a Milk Cooler. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

SPAYING AND MANGE.

Editor Cultivator: Will you please give in The Cultivator explicit practical directions for spaying young sows?

What is affecting my young pigs? Six weeks ago two pigs from different litters in a bunch of eighteen pigs, one of them four and the other seven weeks old, became suddenly affected about their ears, the skin becoming dry and the ears curled and withered.

There was also roughness of the skin on shoulders and sides. I treated them locally with kerosene emulsion, which seemed to stop the trouble, though the ears are disfigured permanently—even lost wholly in one case. Fearing a recurrence, two weeks ago all the pigs were well sprayed with crude oil emulsion. They have had dry quarters on alfalfa pasture and corn for three weeks past. For two weeks before that they were in muddy pens. Now the ear trouble is appearing again. Almost every Duroc-Jersey pig is affected, but not one of the black pigs. I shall spray with Zenoleum before your answer can reach me. Please advise me what is the matter and what to do.

C. A. F., Brawley.

As to spraying sows this is rather an easy operation but hardly possible to describe in print. In every neighborhood there are men that can show you how or who will do it for you at a reasonable price.

These young pigs probably have a form of mange and it was this trouble with ears and bodies that years ago caused the people of California to abandon the raising of white hogs, as the black ones are not subject to skin or parasitic trouble of the skin. We used creolin for our spraying; it is probably nearly the same as zenoleum. The mangy spots need to be thoroughly washed with a good soft soap, put on as a lather and allowed to penetrate before washing it off. Then sulphur and lard can be rubbed in, and this will have to be repeated at the end of a week. The zenoleum can be used instead of the lard and sulphur. These troubles are infectious and everything that the pigs have rubbed against must be disinfected or the pigs removed to fresh pens. After a summer the old pen will probably be all right. But after this introduce new stock only after it has been kept by itself for two weeks, and be sure it is clean from the trouble. Mange is one of the greatest and most expensive curses that a stock man can meet, for it lurks on the place and every little while comes an outbreak. It will be found cheaper on a stock farm to whitewash everything around the pens and stables and fences often than to fight disease.

KICKING COW.

Editor Cultivator: Will you please tell me through The Cultivator the best way to break a young cow from kicking?

L. L. K., Orange.

A kicking cow should not exist, for she should have either been broken of it as a heifer or she should have been sent to the butcher. The heifer can be taken in several ways; first of all a good-tempered gentleman is necessary, then buckle a strap around the cow's body in front of the udder; if the cow offers to kick, tighten the strap until she gives up.

Second way, tie the end of a soft rope to cow's foot, pass the rope around a post to the rear of the cow, hold the rope tight and have a second man milk her.

My own milkers have taken this way: they tie the heifer up short and then take a soft rope and tie the two hind legs together above the hock, then they take the bucket firmly between their knees, push the heifer against the side of the stall, and sit down pressing their head into the hollow place in the thigh above the udder; the heifer may kick, but they push their head in all the closer and harder. Gripping her tightly into the side of the stall, all the while they talk softly to her. They also have her eating while the milking is going on. Usually a week of this persistence and kindness and holding the heifer so she cannot kick brings her to time and the trouble ends.

SIMPLY A FREAK.

A subscriber here wants to know the reason for his cow acting as she does. Since the last calf, some time in the winter has given practically no milk, even when just fresh not over a quart and now about a pint. She is quite an old cow, but not too old but what she should still be all right. Handled and fed same as usual and same as other cows except that milked four or five weeks longer than usual, so was dry only about two weeks. Previous to last calf was a fine cow and gave great deal of milk.

H., Fresno.

This is a freak evidently, for if the udder is in normal condition and the cow healthy that cannot be accounted for. I have had cows do so; one now a cow of records, whose name I will not give, as I no longer own her, that used to make a great record one year and the next would loaf along making a scant three hundred pounds of butter for the year. I would retain this cow until she has calved again, except under one condition, that is, if she should put the flesh on her back, then I would know that she is reverting to a beef strain in her ancestry and that the shambles is her destiny.

SEED CORN AND MILKING MACHINES.

Mrs. M. E. Sherman: I have read your dairy articles in the California Cultivator with great interest, and I feel that they have been of great value to me—this is my excuse for bothering you by writing for additional information. I note that you raise corn at Fresno successfully. Will you kindly let me know what variety you have found the most satisfactory?

Can you give me the address of the manufacturers of milking machnes? I am told that they are putting out a few machines in the hands of expert machine men who are also dairymen, for experimental purposes, and I would be glad to communicate with these companies on that basis.

W. J. W., Lathrop.

The names of the seed corns used for silage are given in last week's Cultivator, otherwise I use any dent corn that I can buy in the market. No, I have no seed corn this year, as I had a mistake happen by mixing up the seed corn in the granary with other feeds and the cows got it all. Accidents like these happen often with us, but I think are now past, for my old foreman, after seven years of service and then seven years of serving others, has come back to me and things are going smoothly. You see, we know each other's ways and he knows where I will tumble down, and I know where he will forget, so we balance each other up.

The machines most favorably spoken of are the ones that Baker & Hamilton are selling and the one manufactured by the Rockhill Foundry Company, of Roanoke, Va. I do not know that any are being put out except on sale. The one operating near Oakland is at present being run by the machine company. I was told to test it more thoroughly.

KICKING HEIFER.

Editor Cultivator: Will you tell me how to break my Jersey heifer of kicking? She has only just begun the habit.—Mrs. C. B. G., San Pedro.

Here is a remedy that is simple and it often effects a permanent cure of the kicking habit. Tie a rope around the cow's head or neck, put a half hitch or noose around her nose and draw her head up about six or eight inches above its customary pose. It need not be drawn high enough to cause her serious pain or uneasiness, and while her head is up she can not lift a hind foot high enough to kick to any harmful extent. Examine the teats, maybe they are sore. A cow seldom kicks unless something is wrong or she suffers pain. If the teats are sore, or if they seem hard, rub on some carbolized vaseline two or three times.

WHEAT NOT GOOD FOR HORSES.

It is a mistake, says Goodall's Farmer, to feed horses on wheat alone. Experiments show that much of the grain is not digested and that horses fed entirely upon wheat very quickly develop intestinal troubles. A ration in which one-third or one-fourth wheat is used is not hurtful, but there is nothing so good for horses as corn and oats with plenty of alfalfa hay. Horses require less grain when fed on clover. If wheat is to be fed at all it should be fed in the shape of bran and shorts, and not whole.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

WORMS IN HOGS.

Hogs affected with worms in the intestines run down in condition, become very thin and lank, back is arched, eyes dull, refuse feed, walk stiffy, and appears lifeless. The worms may be very numerous, in bad cases completely filling the intestines. The pigs die if not treated. To secure the best results, affected hogs should receive individual treatment. Twenty-four hours before administering treatment very little feed should be given them. Then give the following medicine, as a drench, to each one hundred-pound hog; larger or smaller hogs should receive a dose in proportion: Oil of turpentine, four drams; liquor ferri dialysatus, one-half dram; raw linseed oil, six ounces. If necessary, repeat the dose in four days. After worms have been removed, give a tonic to put the pigs in condition.

After a lamb is a few weeks old he can get along pretty well, but previous to that time the flockmaster should see that he gets the proper nourishment and is protected from storms.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

INSECT PESTS (Continued)

In our last talk on some of the insects that make a light egg basket, which also means a light pocketbook, we considered two of the worst pests in this part of the world, the tick and the mite. There are many insects affecting poultry besides these.

There are mosquitoes which are to be found in many localities and become (especially in our Hawaiian Islands and in some parts of New Jersey, Florida and Alabama) a serious pest to fowls.

Where fowls are troubled by mosquitoes the best protection is afforded by greasing the comb, face and wattles with carbolic salve or carbolated vaseline. Mosquitoes breed in cisterns, water tanks and rain barrels, these may be kept free from the larvae by pouring a little crude petroleum or coal oil into the water, the oil floats and prevents the mosquitoes from breeding in it and if the water is drawn from the bottom it will not be unfit for drinking. In larger reservoirs a few small fish will keep the water comparatively free from mosquitoes. Sponging the bites with a solution of permanganate of potash, or even a little bi-carbonate of soda, will give relief.

* * *

Fleas

The common hen flea (Pulex avium) is prevalent in the Pacific States. It is found in filth hen houses, especially those located on sandy soil. Dirty nests, cracks, dust and dark corners are favorite breeding places for them. They produce intense irritation of the skin, and in young birds the growth may be permanently stunted, and very young chickens may be killed by them.

For treating flea bites bathe the bites with vinegar and water, or lemon juice, and apply carbolated vaseline, or lard in which a little carbolic acid has been mixed—five drops of ninety per cent carbolic acid to a tablespoon of lard. To free poultry houses and yards of fleas use whitewash freely, adding a pint of crude carbolic acid to every twelve gallons of whitewash. Spray it or slop it thoroughly into all the corners and cracks. Use carbolized lime, tobacco dust and moth balls in the nests. Dark dusty places in the poultry yards afford favorable breeding places for fleas; these should be soaked with hot soap suds or boiling salt water to kill the young fleas.

* * *

Lice

There are nine varieties of body lice affecting poultry. Each of the varieties has some favorite part of the fowl's body which is its camping ground in preference to other parts, and it seldom trespasses on the neighboring claims. There are, however, two varieties which are wandering lice, and may be found on all parts of the fowl These lice not only travel from fowl to fowl on the roosts at night, but frequently leave the fowls to attach themselves to persons handling them, and may be found in the nests, on the roosts, and even on the walls of the hen house. These lice spread rapidly, one infested bird being capable of spreading the vermin through a whole large flock. In young chicks they cause dumpishness, drooping wings, indifference to food, and may stunt or even kill the chicks.

One of the best means of preventing lice is a dust bath. This bath should be a wallow of freshly turned earth, mellow and slightly damp, out of doors, under some tree in the summer time, or in a box six or eight inches deep in the hennery in rainy weather. Provided with a good dust bath healthy hens will almost keep themselves clean from lice. Not so the cockerels; they are careless about their toilets, and must frequently be examined, and if necessary, dusted.

If fowls are badly infested with lice they should be well dusted with a good lice powder, of which there are a number on the market. Two good powders can be made as follows: To one peck of sifted coal ashes, add one-half ounce of 90% carbolc acid; when mixed thoroughly, add an equal amount of tobacco dust; or, take half a peck of sifted road dust, four fluid ounces of any good liquid lice killer; mix thoroughly and add bulk for bulk of tobacco dust.

The roosts may be painted with liquid lice killer, or the fowl placed in a box, the floor of which has been painted with lice killer, and the top covered with burlap, care being taken not to smother the hen. The nits or eggs of lice hatch about every five days, so, for badly infested fowls the treatment should be repeated until all the young lice are exterminated.

An excellent plan in warm summer weather, just at the commencement of the moult, for getting rid of lice, is to immerse the fowls in a diluted kerosene emulsion, wetting them thoroughly to the skin, or to dip them in strong

EGG FOOD A·C·W IT FILLS THE BILL
Do You Know
That there are in many cases three and four grades of rice, millet, Kaffir corn, wheat and all the other ingredients that enter into a properly made Chick Food. Even charcoal can be the best "willow" or poor stuff made from "any old wood." This information is what is known as a trade secret. All our raw materials have to pass a careful inspection and be A1 grade before they are mixed; no shrunken wheat with no nourishment, or inferior millet goes in A. C. W. Examine the food and see for yourself. Feed it to your Chicks and see how they will thrive—notice the absence of bowel troubles, owing to the mixing of certain materials in the proper proportions to prevent this. We have hundreds of satisfied customers from San Diego to Watsonville that say A. C. W. Chick Food and other A. C. W. products for poultry are **good, honest goods.**

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A Filcher, Commissioner.
And Now Comes New Reward for Merit:
Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

tobacco water. A well known poultryman in Pennsylvania gives the following advice: Take the strongest and purest tobacco (Weyman's cut and dry) twenty-five cents worth being ample to clean off three hundred fowls. I make the decoction quite strong. If the user will observe a few points which I will give, no one will ever regret using tobacco to kill lice, and not a solitary one will be left.

First, for small chicks, if the dipping is done out of doors, the thermometer must be at least 80 degrees in the shade, else it will chill the chicks; second, the water should never be more than blood warm, say 90 degrees; third, this is most important, every solitary feather must be made soaking wet, else you will not make a clean job of it. In dipping, all fowls having heavy plumage, like the Brahma and Cochins, the feathers must be raised with the hand and the water allowed to thoroughly wet the bird to the skin; this takes from one to two minutes for large, well-feathered fowls. If a dry feather is left, there will be lice upon it. I do not dip the head under, but where the fowl was quiet I would dip the head back until all was under up to the eyes, and where they would not hold still, I would use a small sponge and wet the top of the heads. No one who has fowls troubled with lice need fear to try this; it is very effective.

* * *

Scaly Leg Mites.

Scaly legs are caused by a mite which burrows under the scale of the feet and legs, and if neglected may burrow into the shank bones and cause death. It is very infectious. One fowl with scaly legs may infect a whole flock. It can be easily cured if taken in time. Make an ointment of equal parts of kerosene, lard and sulphur, and after soaking the feet in warm suds rubbing vigorously with an old tooth brush, rub in well the ointment. Three or four applications every other day will usually cure it, but after a month it is better to give one more treatment.

* * *

Depluming Mites

These mites cause loss of feathers or baldness; they are to be found at the root of the feathers and cause much irritation. They also frequently cause feather pulling among the fowls. They can be exterminated by thoroughly washing the fowls in the diluted kerosene and carbolic emulsion. The perches and dropping boards should be painted with a good liquid lice killer.

* * *

EDITOR'S QUESTION BOX.

Turkeys. (Mrs. G. J., Geyserville.) Will you kindly tell me through the columns of your valuable paper what is the best food for young turkeys? I feed onions with Coulson's food, but they don't seem to care for it. Trusting an early answer.

Answer. I will tell you the way I feed little turkeys. There may be a better way, but as I usually raise every one, barring accidents, I can vouch for its being a good method.

The first food is coarse sand or chick grit and a drink of milk. Then when they are 24 hours old, I put fresh laid eggs in cold water and boil them 20 minutes, shell and all, add equal parts of dry bread crumbs and feed dry, taking away what they leave and feed the mother separately.

The next day I feed the same, but add very finely chopped lettuce or dandelion or green mustard leaves and tender onion tops. This is their breakfast and supper. For dinner they have a little curd (cottage cheese made from clabber milk). In a few days I add cracked or whole wheat to their supper, and frequently, if short of bread crumbs, add rolled breakfast oats to the egg and onion. I always chop up one onion a day with the egg and bread crumb unless the onion tops are very tender. I knew a man in Kansas who raised his turkeys on an exclusive diet of onion tops and curd, and they did well. In a few days I commence to add wheat to their breakfast and supper, and at two weeks I gradually arrive at giving them wheat and rolled oats for breakfast; at about 10 o'clock a head of lettuce to tear up; at noon cottage cheese; and at about 4 or 5 o'clock their supper of egg, bread crumbs, rolled oats, lettuce, and always an onion cut up. I give them one fountain of clean, pure water and another of sweet milk. There are two chief causes of mortality in little turkeys, lice and over feeding. Under feed your little turkeys, do not give them any grain but wheat until they are two months old. If you follow these simple directions I know you will succeed in raising all your little turkeys.

* * *

Swelled Face. (A. E. S. C., Lordsburg.) I have a white Plymouth Rock pullet (nine months old) which recently developed a bad swelling just under the eye. It is smooth, round, rather hard, and over ¼-inch in diameter. The pullet is otherwise in good condition and general health does not seem to be seriously affected. There has been no sickness of any kind in the flock previously. Please let me know, if possible, through the Cultivator what the matter is.

Answer. Your pullet has either a cold or a barley beard or foxtail beard or a burr of some kind which has entered through nostril or eye. For cold rub the lump with camphorated oil or camphorated vaseline. Some advise opening the lump as it is often a small tumor and this is good plan if it be a burr or thorn, but if it comes from a cold I prefer rubbing with oil, camphorated, eucalyptus or carbolated vaseline.

POULTRY IN PHOENIX

The raising of poultry and squabs is another occupation in which many Arizona women, and especially those around Phoenix, are actively and successfully engaged, and from which they gain good profits. There are very good openings for the poultry business in the northern part of the Territory, where the demand for fresh eggs and young chickens is always so far in excess of the supply as to keep the prices high all the year. For the woman who thoroughly understands the successful raising of poultry there is a veritable fortune in store.—The Earth.

No Results No Pay

WE have spent a vast amount of money experimenting with Poultry Feeds—compounding, grinding and mixing different grains with seeds, alfalfa and meat in hundreds of combinations. Then feeding it and watching what happened.

The result of this time and money is

Purina Poultry Feeds

They will cause a hen to lay all the eggs she should, day after day, year after year, winter and summer, and will keep her healthy and vigorous every minute.

And they will do it every time—not just once in a while.

But don't take our word for it—try the Purina Feeds on your hens at our expense.

If the results don't come, just tie up the bag and write us and we'll return every penny of your money and tell you where to send the balance. You are not out a cent in making the trial, for we will deliver through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

Ask for particulars about our FREE TEST Plan. Write today—you can't afford to wait.

CARE OF CHICKS.

This is the time of the year when the little chicks need the greatest care. Failure or success will depend upon the successful handling of the little fellows during the next sixty days. Mrs. Osborne says in the Poultry Tribune:

The greatest mortality among chicks usually occurs within the first three weeks of their lives, and if we can safely tide them over this period and keep them healthy and growing our success is assured unless some unforeseen danger should befall them. Within this period is laid the foundation for a strong, healthy constitution, and this depends altogether on the care and treatment they receive as to food and shelter. To raise our chicks successfully, they should be hatched from eggs containing strong germs, and these are only laid by hens that are healthy and in good condition, mated with active and vigorous males.

After the chicks are hatched keep them warm and quiet for about 36 hours. Let them sleep and grow strong, which will be of more benefit to them than any care or food we can give them. The nursery under the trays in the incubators being the best place to keep them. When they are taken from the incubator they should be put into a brooder, warmed to at least 90 degrees, and placed in a warm room and kept there for several days until they learn to go in under the hover where they should. Little chicks, when first put into the brooder, will often huddle in the coldest corner, and soon become chilled, rather than go under the hover, so we must be watchful of these small items, for they are what bring success.

After being placed in the brooder their first feed should be some fine grit, and they should have pure water to drink placed in suitable vessels so they cannot get themselves wet. Here let me say, I have never found anything better for that purpose than a tin can such as corn or tomatoes come in; punch a small hole in the side about one-half inch from the top, fill with water, place a saucer over it and invert, and it will make an ideal fountain for small chicks. For their next feed we use the eggs tested out of the incubator and boiled forty minutes, when the yolks will be dry and crumbly and easily digested. Soon we begin to give them pin head oats and some of the different chick foods that are placed on the market ready mixed in the right proportion. Broken rice is added to their bill of fare, also cracked wheat hulled is another good food for them. After a week or ten days a little tender beef, or other lean meat hung up for them to pick at and pull at, will give them exercise as well as great satisfaction. A little green food is also beneficial to them, care being taken not to give enough to cause bowel trouble. The bottom of the brooder should be covered with some litter, and for very small chicks nothing better can be used than wheat bran, as the small particles they may pick up is of great benefit to them. Later chaff or the sweepings from the barn, where the hay is stored, is excellent, as they will find bits of broken clover leaves and seeds, also grass and weed seed, which will keep them healthy and happy, scratching and picking after them until old enough to run at large about the yards. Along with this line of feeding, extra precaution must be taken to keep the body temperature maintained to a normal standard of

We have but one grade of eggs to sell for hatching and those are from our breeding pen composed of only the choicest fowls, selected from hundreds that are ***bred to lay.*** Hens that approach the ***200 egg record.***

Price of Eggs—$1.50 per 15, $5 per 100. ***Send for Illustrated Catalogue. Address,***

LEO. W. MARDEN, Manager

growth. Give no mashes or sloppy food, for I am positive a much larger percentage of chicks can be raised if fed on dry food entirely, with plenty of grit and a little charcoal to help digest it.

Another item not to be overlooked is to keep the growing chicks separated according to size, the larger should run together and hover together and the smaller by themselves.

The whole problem of raising chicks successfully is to simply keep them growing from hatch to maturity.

CHANGE THE DIRT FLOOR.

Every year the dirt that forms the floor of the poultry houses should be removed to the depth of three or four inches and fresh earth put in its place. This is very necessary to the health of the fowls as the soil, after forming the floor of a house for a year, becomes filthy from droopings and germs that promote disease. A neglected house is a sure breeder of cholera and other ailments to which poultry are heir. When the fresh soil is put in, it is well also to make a thin whitewash, add a gill of crude carbolic acid to every gallon of the wash, then apply with a spray pump, forcing the mixture into all crevices of the building, roof and sides. This is an excellent purifier and germicide as well as destroyer of lice and mites upon whose presence in the house it is usually safe to rely on. Then litter should be placed on top of the fresh earth floor. This litter serves to carpet the floor, keeping the birds' feet warm as well as serving as a medium in which to mix the small grains to encourage the fowls to scratch and thereby obtain the exercise they so much need. Four inches of litter is plenty, as too much rather discourages the efforts of the fowls and they do not take as much exercise as if a smaller amount of litter was used. The yard outside of the houses should be plowed up early in the season so as to purify the ground and give the hens a chance to dig up worms and scratch around generally. The yards should be plowed up several times during the year.

HELP FOR LAYING HENS.

People are not wont to give the hen credit for having much sense, but there is nothing in the way of birds or animal on the farm that will respond more quickly to proper treatment or resent improper treatment than the laying pullet or hen.

In the first flush of egg production the pullet is likely to be content with reasonable care, food and shelter, but later in the year she seems to realize that her eggs are valuable and makes certain demands. It is not a good plan to make pets of laying hens, but it certainly pays to pay considerable attention to their wants. See that the food is furnished in variety, that there is more or less green stuff, especially in the fall after they have come from the range, that there is the sunny and sandy spot in which the hens may feather themselves, that there is grit for them to pick at and that the nest boxes are clean and well placed. All these things really come under the heading of proper care, but some persons look upon most of them as luxuries that it is foolish to think of. Try the plans suggested, keeping an accurate account of their cost, and you will find it is profitable to continue the plan.—Farm Stock Journal.

SUNDAY EGGS FOR MISSIONS.

Word comes from Harrodsburg, Ky., that the women of the Bethel Presbytery in that county have decided to give to the cause of missions hereafter all the eggs laid by their hens on Sunday. The question came up at a meeting of their missionary society. The presiding officer read her report, showing that in the year just ended the society had given $23,000 for home and foreign missions.

The announcement set the meeting aflame, and one of the most active members arose with the suggestion that they strive to still higher things. Ways and means were called for, and the egg proposition was laid before the meeting.

At first it was unanimously popular, but after the first flush of the fever had passed several of the members who have dozens of sacrilegious hens, objected. They thought this would be a discrimination. They argued long and loud, but the original motion prevailed, and the Sunday eggs will hereafter be turned over to the mission fund.—Petaluma Journal.

A hen can't dig and scratch lice all night and keep healthy, and a broody hen cannot remain quiet with hundreds of parasites making football rushes over her anatomy at all hours.

Lice breathe through their pores, so any dust will stop their breath and we owe it to Biddie to make her as comfortable as possible. Give her a dust bath.

Feed the hens and roosters well on a variety of nitrogenous foods during mating so as to secure strong, fertile eggs.

Put fresh straw in the nest boxes every week. This helps to keep mites from becoming numerous.

Early hatched chicks will get a good start before hot weather and be better able to combat lice.

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the columns of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

CATARRH.

I have a mare that is bothered with her eyes. They are inflamed a good deal, the lids are quite red, sometimes they discharge a white matter or pus. What is good for same?

C. F., Hemet.

If there are no unhealthy growths in the eye, you can allay the inflammation by applying the following lotion in the eyes several times a day; or if in sun, cover eyes with cloth saturated with lotion: Boracic acid, 4 drams; Fld. Ext. Belladonna leaves, 2 drams; water, 1 pint. Shake and apply.

PROFITS FROM SPRAYING POTATOES

The profitableness of thorough spraying to protect potatoes against fungus diseases and insect enemies was very strikingly shown in experiments reported by F. C. Stewart and associates, of the New York State Station. The experiments have been made under the direct supervision of the station or in co-operation with growers in different parts of the State. In general thorough spraying with Bordeaux mixture was very effective against blight, rot, and flea-beetle.

While in a few cases all loss from these causes could not be prevented even by thorough spraying, in every case where there was a severe outbreak of blight enough good was done to repay all expenditure, both of money and of time. Generally, spraying was very profitable. Of those whose tests were reported to the station, thirty growers made a net profit of $10,000 from spraying.

In fourteen co operative experiments covering 180 acres, made in 1904, the average increase in yield due to spraying was 62¼ bushels per acre, the cost of spraying was $4.98 per acre, the cost per acre for each spraying, 93 cents, and the net profit per acre $24.86. Similar and almost equally profitable results were obtained in six experiments made in 1903.

Not only were there gains in yield due mainly "to lengthening the time of growth by preventing foliage destruction by late blight," but the sprayed potatoes, being more mature, were of better cooking quality.

Chemical analysis showed about one-sixteenth more dry matter in the sprayed potatoes and one-ninth more starch. Cooking tests confirmed the analysis, as the sprayed potatoes were noticeably more mealy than those not sprayed, and were pronounced of much better quality by all who ate both.

The mixture recommended by the station is Bordeaux of the 1-to-8 formula; that is, 6 pounds of copper sulphate to 50 gallons of water, the acid of the sulphate being neutralized by about 4 pounds of good stone lime. Paris green may be safely added to thoroughly neutralized Bordeaux(mixture and) this combination—Bordeaux and an arsenical poison—has given better results in station tests than any other fungicide-insecticide treatment for potato pests.

If thorough spraying is the object, it would be best to begin when the plants are 6 or 7 inches high and to spray every ten days or two weeks thereafter as long as the plants remain green. If rain comes before any application is dry on the vines the treatment should be repeated, but spraying should not be stopped because "it looks like rain."

Among our advertisers in the ill-fated city of San Francisco was The Paraffine Paint Company, manufacturers of Malthoid Roofing. This Company's factory is located at Paraffin, Alameda County, acros the bay from San Francisco, and was not injured in any way. The temporary main office of The Paraffin Paint Company has been established in the Union Savings Building, Oakland. No advance has been made in the price of Malthoid Roofing or of any other products of that company.

SAVE ALL THE GRAIN YOU GROW!

Let Us Reason Together

BETWEEN seed time and harvest, the grain grower has to trust very largely "to luck."

Nature makes the crop in her own way.

But when harvest time comes he must "get busy."

His profits then depend upon the wisdom with which he harvests his grain.

The wise man begins to get ready weeks before the actual time of harvest.

He knows he can't "trust to luck" then, and he does not want to be caught unprepared.

The first thing he does is to make sure that he has the right facilities for harvesting—the right kind of machines for the proper cutting of his grain.

He wants to get every spoonful of grain that Nature has given him.

He wants to get it with
—the least delay in time;
—the least labor on his own part;
—the least hardship on his horses;
—the least likelihood of trouble and annoyance.

He cannot "trust to luck," and certainly he cannot trust to a poor harvesting machine, a worn-out harvesting machine or an *uncertain* harvesting machine.

How about *you* and *your* harvest?

If you are a businesslike farmer, you will get ready for harvest *now*.

Go to a dealer who handles any one of the International line of harvesting and haying machines.

Get a catalogue, look at the machines, study their construction, and you will *see for yourself* that they are built to meet every requirement.

In *principle of operation*—in design—they embody all that the most skilled mechanical experts have discovered in the past 50 years.

In *materials* they have lumber, steel and iron of the highest grade only—the selected products of the manufacturers' own mines and mills, produced for the purpose of harvesting machine building.

In *workmanship*, it is the product of the best facilities that money and experience can produce.

In everything that makes a machine *reliable*, *trustworthy*, *durable* and *efficient*, the

Champion Milwaukee
Deering Osborne
McCormick Plano

Harvesting and Haying Machines, represent the highest grade of excellence.

These machines have been before the public for a long term of years—some of them for more than half a century. Other machines—scores and scores of them—have come and gone. These have remained, growing every year in popularity Is the stamp of approval placed on a machine by the farmers of America and grain growers of the world worth anything?

Is it not certain that their popularity has been merited? Men do not buy machines year after year, unless the machines do satisfactory work.

To-day the standard harvesting and haying machines embraced in the International line, are *better* than ever before, because they are the products of riper, richer experience, more expert skill, and better and greater facilities for manufacture than were possible in the past.

The manufacturers of these several machines, by close co-operation, are able to own, control and operate their own coal mines, iron mines, lumber camps, coke ovens, steel mills and other sources of supply, producing their own materials, under their own supervision.

They get these materials *when* they want them, not being dependent upon uncertain and fluctuating markets; they get them of the right quality.

By co-operation they are enabled to employ the most expert skill in designing improvements and in the actual mânufacture of the machines.

By co-operation they are enabled to employ extra facilities for the economical production of machines of the highest quality, facilities which are impossible for an individual manufacturer.

By co-operation they are enabled to surpass even their proud records of the past.

—If you expect to save *all* your grain;

—If you want a harvesting or haying machine on which you may depend with absolute certainty;

—If you want to be free from "break-downs," delays, and repair bills:

Take a little time, go and talk to an International Agent.

Inspect the machine he handles and get a catalogue.

It will pay you whether you buy this year or not.

If you don't know an International dealer—write to us for the name and address of one nearest you.

Queries and Replies

HAY MEASUREMENT.

F. W., Redondo Beach.—Your letter concerning lose hay, does not state what kind of hay you have reference to. There is considerable difference in the packing character of hay, as for example, alfalfa, barley and wild hay. No definite answer can be given you.

IMPORTANT PRINCIPLES OF PRUNING

1. Pruning has varied purposes and is practiced upon very diverse species of plants. In consequence, the same rule cannot be applied in every case.

2. Pruning during the dormant period of the plant tends to increase the growth of wood rather than the production of fruits.

3. Pruning during the period of growth tends to check the growth of wood and increase the yield of fruit. The vegetative and reproductive functions, between certain limits, are reciprocal; increase one and you decrease the other, and vice versa.

4. Pruning of the roots (which is rarely practiced) tends very much to increase the fertility of the fruit trees and reciprocally to check the growth of wood.

5. Pruning ought to be done methodically and regularly, a certain amount being done each year instead of once every five years. This rule is very important.

6. The object of pruning is to repair wrongs, to correct faults of growth and to increase or diminish the fertility of the tree. When there is no evident reason for pruning, do not prune.

7. The high branches should be cut uniformly and also as near as possible to the mother branch. The large scars should be painted with white paint.

8. The best implement for pruning is a pair of pruning shears. A sharp saw will be necessary sometimes, but not often, except in the case of neglected trees. The axe is never employed.

9. Pruning alone will not give satisfactory results. It is necessary to add to it good watering, good fertilizer and good care in all respects.

IRRIGATION PROJECTS

Below will be found a statement showing the States and territories in which the irrigation projects thus far investigated are situated. It will be noticed that the total cost of the projects investigated exceeds the total sum available, but this is not an important point, in view of the fact that the irrigation fund is growing at the rate of about $3,000,000 per year and several years will elapse before any of the larger projects can be completed. The fund will increase with greater rapidity as soon as works are completed, for under the law, one-tenth of the total cost is to be repaid to the government each year, thus creating a fund which may be used over and over again through as many years as the government may desire:

Arizona, Salt River	$ 3,000,000
California, Yuma	3,000,000
Colorado, Gunnison	2,500,000
Idaho, Minidoka	2,600,000
Montana, Milk river	1,500,000
Nebraska (Wyoming), Pathfinder	1,000,000
Nevada, Truckee	3,000,000
New Mexico, Hondo	275,000
North Dakota, Fort Buford	1,200,000
North Dakota, Bismarck	250,000
North Dakota, Trenton	300,000
Oregon, Malheur	2,000,000
South Dakota, Belle Fourche	2,100,000
Utah, Utah lake	1,000,000
Washington, Big Bend	1,500,000
Wyoming, Cody	2,250,000
Total	$27,000,000

HOW GOOD THINGS ARE APPRECIATED.

Demand for a Superior Poultry Food Forces Extension of Facilities for Supplying It.

Nearly all of the poultrymen on the Pacific Coast have noticed the attractive advertising being done by the Acme Mills Company of Portland, Oregon.

It is rather interesting to know how the Acme Mills Company got started in the Poultry Feed business.

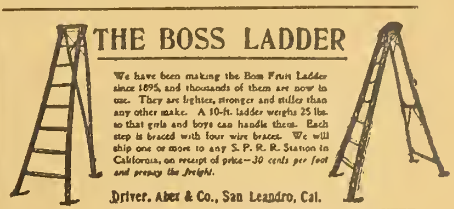
The Ralston Purina Co., of St. Louis, Mo., are the Eastern manufacturers of the great Ralstone Health Foods and some years ago they made arrangements with the Acme Mills Co., of Portland, Oregon, to manufacture these same goods for the Pacific Coast. About a year ago the Ralston Purina Co. saw a chance to put on the market something new in the way of a feed for chickens and after a great deal of experimenting they decided upon the formulas which have since given them this enormous business.

The tremendous advertising being done by this St. Louis mill brought in a great many inquiries from the Pacific Coast (since it is a well known fact that almost every poultryman reads a poultry journal) and the big flaring "ads" which have been flaunted so boldly in the face of the chicken men have not failed to interest the Pacific poultryman, as well as his brother in the eastern states. It seemed quite natural, therefore, that the Ralston Purina Co. should turn to their Pacific Coast cereal manufacturers and suggested that they also take up the poultry feed business.

In view of the fact that the Acme Mill Co. have two of the largest rolled oat mills on the Pacific Coast, they were most admirably situated to take up this new line of business. Anyone familiar with a rolled oat plant knows that in the milling of oats there is a large amount of the oat groats which are bound to break up in the rolling process. These broken oat groats are just as good as the whole oat groats which are used to make rolled oats for the breakfast table. But owing to their smallness in size and uneven grade, the oat miller seldom uses them in making the best grade of rolled oats. Heretofore the Acme Mills Co. has always sold this product to people who are raising chickens, for these tender, little broken groats are just the thing for the baby chicks and in addition to their broken groats their daily output of oat middlings and oat shorts has been very large and a most valuable product for the chicken men.

The oat products which this company is able to secure, has placed them in a very strong position to manufacture the very best grade of poultry feeds that can possibly be turned out, and what has heretofore geen a by-product in the manufacturing business of the Acme Mills Co. is now playing a most important part in one of their chief departments of trade.

With four mills located in the Pacific northwest, this company has an opportunity to draw from almost every grain-growing district on the Pacific Copst, and in order to take care of their poultry feed business, they have built an entirely separate plant, which started to run Oct. 15 and which has been running continuously day and night ever since.



THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—*30 cents per foot and prepay the freight.*

Household Department

OVER THE RIVER.

Over the river they beckon to me,
Loved ones who've crossed to the farther side;
The gleam of their snowy robes I see,
But their voices are lost in the dashing tide.
There's one with ringlets of sunny gold,
And eyes, the reflection of heaven's own blue;
He crossed in the twilight gray and cold,
And the pale mist hid him from mortal view.
We saw not the angels who met him there,
The gates of the city we could not see;
Over the river, over the river,
My brother stands waiting to welcome me.

Over the river the boatman pale
Carried another, the household pet;
Her brown curls waved in the gentle gale,
Darling Minnie! I see her yet.
She crossed on her bosom her dimpled hands,
And fearlessly entered the phantom bark;
We felt it glide from the silver sands,
And all our sunshine grew strangely dark.
We know she is safe on the farther side,
Where all the ransomed and angels be,
Over the river, the mystic river,
My childhood's idol is waiting for me.

And I sit and think, when the sunset's gold
Is flushing river, and hill, and shore,
I shall one day stand by the water cold,
And list for the sound of the boatman's oar;
I shall watch for a gleam of the flapping sail,
I shall hear the boat as it gains the strand,
I shall pass from sight, with the boatman pale,
To the better shore of the spirit land.
I shall know the loved, who have gone before,
And joyful sweet will the meeting be,
When over the river, the peaceful river,
The angel of death shall carry me.

—Nancy Amelia Priest.

How Bessie Bought Her Piano

"Oh, mother, have you really bought it?" and Bessie Greig gazed admiringly at the shining new piano that greeted her eyes as she came home from school. "It is just like Rosy Lee's," she continued, then turning her sparkling countenance toward her father's, her features suddenly lengthened. There was a tired look that she had never noticed there before.

"My child," began her mother sadly, "you know that I get you all that I can afford, and your father is working himself to death, almost, so I don't see how I can buy this for you. There is an agent here, and he pleads so hard to leave it on trial for the neighbors that your father finally gave his consent."

Bessie tried to cover her keen disappointment, but here mother continued, "my child, you have many things that I never thought of having when I was young."

There was a restraint at the tea table that night. However, the young stranger did not seem to notice it. He talked of the virtues of his instrument and told how much a girl could make were she a music teacher. The three Greigs listened intently to the agent's conversation. Mr. Greig watched his daughter closely and saw more than she thought he did.

"Now," began the interesting stranger again, "after your girl has taken lessons, say a year or so, she would improve in music very much and in every desirable way."

"Well," replied her father, grieved at the sight of her tear-stained cheeks, "If Puss wants to raise strawberries, she can have all the money she earns from them, if she'll keep us in berries. How does that suit you, Puss?" and he slyly pulled one of her shining braids of hair.

"There's Brown's old patch," continued Mr. Greig, "that he set out two years ago; it is on his muck garden. He told me today that he will not have time to take care of it because he is on the road so much. He wants to let me have the use of it this year for subduing it. I believe I will accept his offer.

"If Sis 'll care for and pick the fruit," volunteered the oldest boy, John, "I'll trim out the patch and run the cultivator through between the rows."

At this, a happy light crept into Mrs. Greig's tired countenance, for she had always wanted a strawberry bed just like her mother used to have. Berries were too much of a luxury for them to buy often. The agent, pleased with the turn affairs were taking, exclaimed, "I will give you ten dollars of my commission, if you will purchase the instrument for the girl."

Bessie now swallowed the lump in her throat and began to look her sunny self again. Upon departing, the young stranger left an after glow of hope which seemed to reflect itself in every one's face. Bessie found it easy to catch up several old hymns, so that singing became a regular evening feature.

Oliver Bouncer, the school teacher, was a good musician, and to win the good will of his hostess, Mrs. Greig, as well as her daughter's, he gave them regular instructions in music.

One morning in early March, John and his sister went down to look over the "new strawberry bed.' They found that it had been planted on a well fertilized and carefully prepared piece of muckland. But the weeds had not been kept down. As it was dry and sunny overhead, John set fire to the patch and the tall, dead weeds crackled to the snow frosted ground and the hungry flames licked them up.

"I am afraid that will hurt the plants," exclaimed Bessie anxiously. "No," replied her brother as he pointed to the leaves under the thin crust of snow. "They will come up all the more vigorously. Just as soon as we can, we will cultivate out some of the vines. They are a perfect mat. No one has kept the runners cut."

"Is it not a large patch?" said Bessie to her mother, who was now coming down the lane to join her son and daughter in this new interest.

"Oh, mother, this is a happy day," continued Bessie. "Will you not be proud of me when I earn money enough to pay for the piano."

Mrs. Greig was as enthusiastic over the new plan as the young people. "I never saw such vines," she laughed. "We must cut off every runner as fast as they come this spring and transplant them. Brown purchased the choicest varieties, and that is the only profitable way. Parker Earl receives four dollars a bushel for his berries when ordinary kinds are marketing for two dollars and fifty cents."

Sometime later Harry drew enough old straw to cover the plot. The spring was very late; a heavy snow storm fell on the 11th of April. How anxiously Bessie watched for the first bare ground. When the last of winter's wool had disappeared and a warm thaw had commenced, the fair gardener began to hope; but alas, a frost appeared as regular as night.

"I have an idea,' exclaimed John to his sister, and as usual he carried it out. In a day or so the patch was covered with old, rich straw. The cold nights ended in a black frost. In most every patch. every ambitious bud was cut off. In the Greig patch the straw had generated a warm steam so that the berries ripened unusually early.

As the crop elsewhere was almost a failure, Bessie commanded her own price. When she exhibited her first picking, her father exclaimed, "I never saw such berries. The horse and buggy is at your service."

So Bessie arrayed the tempting red berries in the spring wagon and drove merrily to market.

"How much?" asked her mother, surprised at the quick trip, as the girl dashed into the kitchen. Laying down the mail, she opened up her purse, gleefully saying, "So much for our morning's work," and Mrs. Greig, in

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

her excitement, nearly dropped the pan of gooseberries she was perparing for tarts.

"I always knew John was smart," she exclaimed. "I am proud of you, I am. Four dollars for a bushel of strawberries. I am thankful," she smiled.

At the end of the first week the "girl farmer" was the heroine in the Greig district. "Father," she said Saturday noon, "here are my earnings to date. Please take care of it for me until I am ready to use it."

"I will be your bank," he laughed, slipping the thirty dollars in his money bag.

"I wonder where your father is going, Bessie," asked Mrs. Greig, as she saw her husband drive away. "I have not heard him say," replied her daughter.

"I do believe he has some secret plan," she smiled. "Suppose, Bessie, that we have a shortcake for dinner. John has been asking for one every day. The school teacher is very fond of your baking."

The girl blushed as she meekly replied, "I'll do the best I can."

Just as Mr. Greig drove into the yard the supper bell rang. When he came into the kitchen the others were waiting for him at the dining room table.

"That looks good,' he ejaculated, as he saw the shortcake cooling, while its creamy puffs grew red with rich juice of whipped cream and berries. In a twinkling he had cut a piece and laid it on a plate. Placing something under its edges, he went into the dining room and placed it near Bessie's plate.

"Thank you, father," she laughed, but as she saw something flutter at the edge, she drew out a paper. It was a crisp bank note for $100. "What does it mean, father," she fairly gasped.

Then followed the story of the surprise. "You see I've been to the auction. They had a fine blooded colt for sale. It went cheap. So I added some of my greenbacks to yours and we purchased it. As I was coming through town, Jenkins, the druggist, called to me and wanted to buy the animal. He offered me $200 and I sold it to him. That money is your part with interest."

"Oh, father, thank you, thank you," exclaimed Bessie, as visions of success rushed into her mind.

The strawberry patch yielded so well that the piano was paid for out of Bessie's strawberry money, and it was planned after a year longer at home that she should take a full course at the Boston Conservatory of Music.—Irene Davis, Milford, Mich.

WRITE AGAIN.

Editor Cultivator: I read in The Cultivator you would like letters from young folk, now I am going to write one. I am 14 years old, I would like to know of what books to read. My liking is for animal books, I love birds and domestic animals, what books would you recommend for me on these subjects?—Jennie P., Upland.

Glad to hear from Miss Jennie; she writes a well-composed letter. In the list of writers on animals, Seaton Thompson is probably as popular as any. Clara Hooper on birds is an interesting writer. We would suggest that you write Dr. C. J. K. Jones, assistant librarian Los Angeles Public Library, for his judgment. He is reviewing books all the while. Write again.

.SMALLEST OF OUR ISLANDS..

Editor Cultivator: Will you tell me through The Cultivator something about the island of Guam? Where is it? What grows on it, and who inhabits it? Does it belong to the United States? I want this informa tion for my school class.—T., San Luis Obispo.

Guam, or San Juan, is described in the Brittanica as the most southern of the islands possessed by the United States. It belongs to this government now. It lies east of Manila in the Pacific Ocean. Our government uses it only as a supply station.

The natives are of mixed blood, descendants of Spaniards and Philippine Islanders. They are a peaceable and industrious race of agriculturists and mechanics. Their capital city has over 6,000 inhabitants, which is about two-thirds of the entire population of the island; nearly all reside in the towns, which are very neatly kept. There are a few who own ranches and have rude houses upon them, where their families spend a portion of the time. Only about one per cent of the whole island is under cultivation. It is about 100 miles in circumference.

Rice, corn, sugar cane, beans, tomatoes, indigo, cotton and tropical fruits are grown in abundance. Their meat consists of the flesh of the deer, wild goats, cows and pigs. Flying foxes are numerous; these also are eaten. The domestic animals of Europe were imported long ago, but most of them have become wild.

Centipedes and wasps are common, both indoor and out. There are also small scorpions. The stings of none of these are dangerous, neither are the spiders harmful; they are common, however, and some of them are very large. There are no tarantulas and no snakes.

The people are cordial and friendly; as a rule they are of a good physique and pleasing appearance; their complexion varies from the white of a Caucasian to the brown of a Malay. Most of them have glossy, black hair. They are naturally intelligent and quick to learn. There is very little money on the island and wages are very low. The climate is temperate throughout the greater part of the year.

THE COMMON HOUSE FLY

A most valuable Bulletin has been issued by the State Agricultural College, Pullman, Wash., on the common house fly as a dangerous pest.

House flies breed in fresh horse manure, human excrement, and nowhere else.

They scatter filth and spread disease wherever they alight.

House flies are capable of multiplying into the millions in a month.

The flies parading over food and dishes have every one of them just come from a bed of filthy excrement.

Flies are made so that they have to "spit" first on everything they eat before they can swallow it.

"Fly-specks" are twice voided excrement, first by the horse, then by the fly. Should we tolerate them?

House flies are responsible for more typhoid fever than bad drinking water is.

House flies may be a cause of such disease as consumption, colds, dysentery, and cholera.

One ill-kept table or neglected outhouse is more than sufficient to start a plague of this dirty nuisance, which may be the cause of many deaths.

And lastly, that house flies can easily, simply, and effectively be checked.

Hints for the Cook

SALT-RISING BREAD.

Editor Cultivator: Will you give me a rule for making salt-rising bread? My husband would be happy if he had salt-rising bread, I believe. M. A. C., Lincoln.

Here is one way given to make salt-rising bread:

Take one-third pint new milk, warm. Dont' boil so it will cook the meal. Put one teaspoonful baking powder in the milk; stir in new meal enough to make batter, not too stiff. Heat two or three sad irons hot enough so they will not scorch; put comfort on table; put towel around tin; put irons around it; cover over with comfort, so it will keep warm enough to rise. Set over night. In morning pour in little warm water; stir down and let rise again. Then take one pint warm water, one teasponful soda. When the meal is light put in the water. I use half-gallon tin. Stir in flour enough to make stiff batter. Set in warm water; let rise. Be sure you always have good fresh meal. I think that has a great deal to do with the luck. Meal is awful easy to must, especially in warm weather. When your yeast rises to run over top of tin take one pint warm water, teaspoonful soda and salt, pour yeast in flour, work into a stiff dough; work until nice and smooth; make in loaves; put in warm place to rise light. Take out pans and work again. Let rise. Do not let dough get too light. Bake in moderate oven one hour.

* * *

ORANGE OMELET.

Beat the yolks of six eggs with seven teaspoonfuls of powdered sugar. Whip the whites to a stiff froth and pour the egg and sugar mixture over them. Mix lightly, at the same time adding the juice and grated rind of a large orange. Melt a tablespoonful of butter in a frying pan and tilt it about until the bottom and sides are well greased. Pour in the omelet and cook slowly. When firm and nicely browned set in a hot oven for two minutes, then fold it together, place on a heated dish and serve at once.

* * *

ENGLISH MACARONI PUDDING.

Break one package of macaroni into pieces and cook in boiling water until tender; there should be a generous quantity of water, so that the macaroni does not stick to the pot. Drain off the hot water and blanch the macaroni by washing in a colander with cold water. Next line a good-sized pudding dish with a layer of macaroni, add a sprinkling of salt. American cheese grated fine, tiny lumps of butter, and a few grains of mustard, dissolved in water. Repeat these layers until the pan is full, having the cheese and seasoning on top; sprinkle the top with three or four tablespoonfuls of Worcestershire sauce and fill the pan to the brim with sweet milk. Bake in a moderately hot oven for one-half hour.

REMEMBER THIS.

Never strike a child and send it to bed. If it is necessary to correct it for a wrong it has done do not do so by striking it. A sensitive child will often go to bed and lay awake for hours sobbing out its grief. The damage is often severer to the heart than to the body. Then, too, remember we have no assurance when we say good-night that we shall say good-morning. The angel of death lingers so near us all.

Mrs. Bacon—Where's your husband?

Mrs. Egbert—In the other room, under the sofa.

"What in the world is he doing under the sofa?"

"Whv, he's going to get an automobile next week, and he wants to get used to it before it comes!"—Yonkers Statesman.

SALT LAKE ROUTE

EXCURSION RATES TO EASTERN CITIES.

The Usual low round trip rates to the east will be available this season from California and Nevada stations of the Salt Lake Route on account of various conventions as follows:

New Haven, Ct.—Knights of Columbus—Sell May 24, 25, 26—Return limit August 31. Rates will be announced later.

Denver. Colo.,—B. P. O. Elks—Sell July 17, 18, 19—Return limit Sept. 30. Rate $55.

Minneapolis, Minn.,—G. A. R.—Sell August 7, 8, and 9.—Return limit Oct. 31. Rate $70.

Milwaukee, Wis.,—Order of Eagles—Sell Aug. 7, 8, 9,—Return limit Oct. 31. Rate $74.50.

Also sell July 2 and 3—Return limit 90 days
Sell August 7, 8, 9, and Sept. , 9 and 10—Return limit Oct. 31.

Chicago, Ill.,—72,50—St. Louis Missouri, $67.50.

St. Paul, Minn. $70,00—Minneapolis, Minn. $70.00.

The excellent train service and equipment of the Salt Lake Route and great variety of routes offered affords opportunity for an enjoyable trip. Inquiries from prospective travelers will receive prompt attention from Agents or T. C. Peck, A. G. P. A., Los Angeles.

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil, this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

SOUTHERN PACIFIC

"BACK TO THE COUNTRY."

People flock to the cities today and stay there, not so much because they like to, as because they must. Before the inexorable conditions that dominate men in an industrial age, they are as helpless as chips carried by a great torrent, and the country man who drifts to a great city is like the twig that is washed from the soil far inland and swept by the current to a great ocean. A multitude of people of small means, and not owning land, are now in the cities, not because they find the city more agreeable, but because circumstances force them there. Apparently in each case there is an immediate cause, but careful observation will show that there is one great underlying cause of all the migrations from country to city. There is a great force from which no man is free, that carries away a definite percentage of the people to replenish the cities, which with each new growth acquire the power of absorbing and blighting still more lives. It is not only that the city attracts; the country repels. This is why there has been so little response to the cry of "Back to the Land!" As long as it continues impossible for the people to get back to the land they will stay where they are: in the cities. The country produces people and thrusts them on the cities, but never takes them back. The reason is to be found in the relative opportunities offered to the wage earner. Opportunity is the gate to the cities and lack of opportunity is the insurmountable barrier that excludes a great number of the people from the boon of country life. However much the wage earner may yearn for the freedom and the pure air of the country, his only opportunities are in the city, and there he must stay. A limited number of people can live in the country as farmers; the rest of our population must forever depend on work in the cities or towns for a livelihood. If we are to preserve the vigor of the race, we must provide for the health and happiness of these.

It matters not how much room we have left in the country, if the man who wants to go to the country finds it impossible to get there. We can only get the wage earner back to the land by getting the factory and the office back to the land and there replacing the tenement by homes on the land. Every clerk and factory operative who so desires should be enabled to buy a home-acre convenient to his work. Rural life, within the reach of every wage earner, would place modern industrialism on a sound social and moral foundation that it has heretofore lacked. The menacing problems of present-day congested city life will vanish before the wage earner's fireside and home-garden of the future. And not until modern industrialism has been adjusted in this way to the needs of a healthy moral development of the factory will the democracy of our forefathers have permeated the industrialism of later generations.

A GOOD HUMORED MAN.

A man who can shave himself quickly and easily is likely to be a good humored man. If he comes out of it, on the other hand, with a sore face, he's likely to be surly. These things affect most all men alike. Those who want to come up smiling try to get the conditions right. They don't shave with laundry soap, for instance. He's not only a sour-faced, but a very foolish man who does that. Williams's Shaving Soap would put him in a better humor and give him a better face for keeps. It's pretty near an ideal soap and made just for shaving, nothing else. It will give you, if you are a laundry or toilet soap user, a smoother face and a pleasanter face. If you want to try for yourself before you will consent to be convinced, write to the J. B. William's Company, Glastonbury, Conn. If you write them enclose a two-cent stamp for a free sample.

"Bobbie, have you said your prayers yet?"

"Good gracious, yes! Why, I'm three weeks ahead."—Life.

Foreign Lemon Sale.

NEW YORK, May 1.—Twenty-three thousand boxes of Sicily lemons were sold at auction here today. The stock was in poor condition. The market is very strong. The next sale will probably be held on Friday, but the quantity to be offered is uncertain. Fancy 300s brought $3.00 to 3.50; choice 300s brought 2.60 to 3-10; fancy 360s brought 3.10 to 3.70; choice 360s brought 2.75 to 3.25.

Lemon Sale at Boston.

BOSTON, May 1.—Twenty-two thousand boxes of Palermo lemons were sold today at auction. Fancy 300s brought from 3.25 to 3.50 while choice grade 300s brought 2.65 to 2.85. The ranges on sizes 360s were the same as on 300s. Twelve thousand boxes of Messina, Catania and Sorrento oranges were also offered today. Whole boxes brought 2.80 to 3.30 while the half boxes brought around 1.15.

COUNTY FARM ORANGES.

We are glad to notice that the returns from some property belonging to the County of Los Angeles are so satisfactory. The orange crop of the County Farm this year, to date, has returned $10,500 with three cars of Valencias yet to be shipped. It should be very gratifying to the tax payers to find that not only do they own such a valuable property, but that it is producing such a splendid income.

In relation to this subject a few figures may be interesting. The returns from the 2700 orange trees constituting this orchard for several years past have been as follows:

1903..................	6542.09
1904..................	4073.56
1905..................	6567.21
1906................	10,500.00

with three carloads of Valencias yet to be shipped.

In 1904 some 300 trees of poor varieties were rebudded to navels, reducing the crop that year. In 1905 the bearing trees more than made up the deficiency and in 1906, the present year, the buds are bearing and with good prices the above satisfactory results were obtained.

This demonstrates that although property may be "Public," and owned by the County, it can be made to produce and be as profitable as the best private orchards, if conducted by practical men along good business lines.

JAPANESE PERSIMMONS

Paper read before Alabama State Horticultural Association at annual meeting January, 1905:

History. In Japan the Japanese persimmon, or kaki, as it is called by the natives, has grown wild from time immemorial. It is very highly prized by the Japanese who have been cultivating and improving it for several centuries. With them it is what the apple is to North America. It is their national fruit. No tree is more admired by them or given more attention. It is a conspicuous tree in the landscape of the "Island Empire."

In appearance it is very similar to our well known, wild varieties, except it does not grow so large. The first attempt to introduce the Japanese persimmon into this country was made by the United States Department of Agriculture in 1863.

This department imported and planted a large number of seed which germinated and grew well, but which were killed by cold during the first winter of their existence. The same process was repeated the second year with the same results. Nothing more was done towards its introduction until about ten years later, when the department imported a large number of trees and distributed them throughout the south. About the some time the Rev. Henry Loomis of California, received a shipment of trees. These, too, were disseminated through the south. He also sent out numbers of descriptive circulars with full sized, brilliantly colored varieties which astonished and fascinated fruit growers to such an extent that happily they were induced to try this most interesting pomological novelty.

VEGETABLE MARROW

These squash varieties are not widely known in this State, although highly esteemed by residents of European birth, who understand the best methods of preparation for the table. They have a characteristic flavor quite different from ordinary squashes. In order to get the pleasant flavor, however, it is necessary to gather the fruit while still young and green, before the seeds mature (experience quickly teaches just when). The English method of treatment, which brings out the true marrow flavor, is to cut into longitudinal sections, pare and take out the seeds, drop into boiling salted water and boil until tender; drain and serve, without mashing, with a white sauce dressing. Ripe vegetable marrow may be boiled in the shell; when tender scrape from the shell, mash and season as with summer squash.

AN ENVIABLE RECORD.

The Good Book says that the years of a man are three score years and ten and it intimates that he will have trouble afterwards, but our good friends, J. A. Bird & Company, of Boston, manufacturers of Rex Flintkote Roofing, are entering upon the seventieth year of their business life with all the ginger of youth.

It is rather unusual for a firm to remain for three generations in one family, and it gives that firm an important advantage as it keeps their policy of business constant from generation to generation. The excellent reputation of this firm throughout the world is reflected in the Rex Flintkote Roofing which they manufacture, and the reliability of the house is the best guarantee that one could have of the reliability of their goods.

A postal card sent to J. A. & W. Bird & Company, of Boston, will bring full information regarding Rex Flintkote Roofing and samples, which will be of value to anyone who is going to put up or repair any farm building.

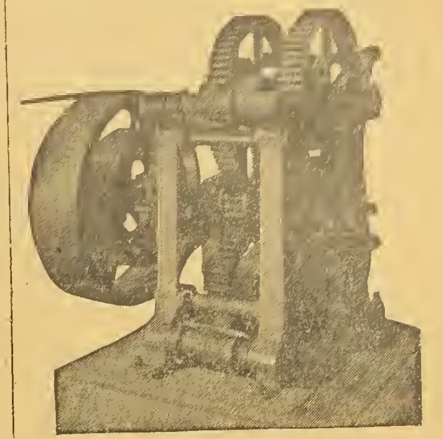
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest Improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

U. S. Carbolic Insecticide

Trade Mark **TREE WASH** Registered

To grow fruit profitably must become a study with the grower, and to raise it successfully he must be constantly watching and guarding against the pests that attack both fruit trees and vines.

This insecticide requires no heating or boiling of water, but is used simply by diluting with cold water, assimilating perfectly, requiring no agitation, forms no sediment, no clogging of nozzles, and will not injure the hands in the least, but will, like carbolic acid, heal and cure sores if on them. It is cheaper than any other preparation or method, considering the results obtained.

The best fertilizer to the trees. The one that leaves them clean and healthy. The one that brings results and pleases. The easiest prepared for spraying.

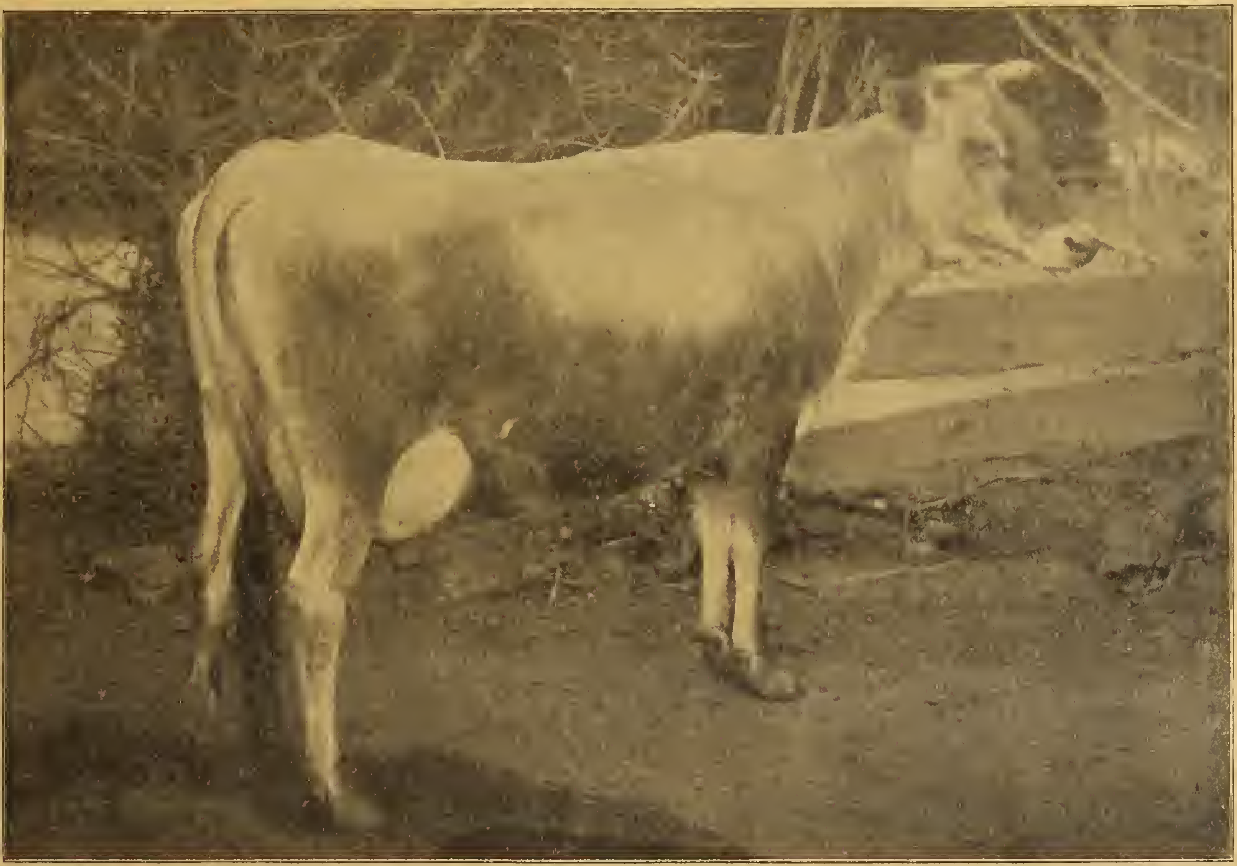
DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES

LOS ANGELES MAY 11, 1906 SAN FRANCISCO



A TYPICAL REGISTERED JERSEY

The Jersey cow is as much an art product as is a picture, a symphony or a poem, because she has been created by man by the application of nature's laws as an expression of his ideal; and because she possesses beauty in just so far as he has obeyed those laws. Art is a means of expression and cattle breeding is such a means. The Jersey shares the peculiarity of painting in that each cow is an original creation which can not be duplicated, though under extremely favorable circumstances it may be copied.

HOW SHOPPERS MAY SAVE MONEY.

A chance to save the lady shoppers money in their trading is what Weinstock Lubin & Co. offer to Cultivator readers this week. This big mail order house, located at Sacramento, is one of the first on this coast to take up this satisfactory method of shopping. Its reputation for honesty and square dealing is such that shoppers may feel perfect confidence in entrusting their orders to it and getting goods which will not only be honest measure but the best which the market affords.

To facilitate the best selections, a fine, large catalogue is issued which will be forwarded on application. Not only that, but samples will be forwarded for more perfect selections from which one will have the best opportunity to choose goods which will be entirely satisfactory.

The mail order system of shopping is becoming every day more general with shoppers who are not located in the large cities, or even there where the best of selections are sometimes not in position to offer the advantages of the immense stock which these large mail order houses carry, in addition to the low prices which it is possible to make from the large jobbing purchases which such houses are able to make.

All that Messrs. Weinstock & Lubin ask is to examine a few examples of the savings made by this shopping. They give a number of tempting offers which will appeal to our lady readers who we trust will not fail to see that the firm guarantees the satisfaction of purchasers.

We think this house is worthy of a trial order which will soon determine the most skeptical whether it will pay to buy goods at lower prices than from the ordinary country store and at the same time have the advantage of selecting from a large, up-to-date, well selected stock.

The office of the Mountain Copper Company, in San Francisco, was destroyed by fire and they are now located at 1020 Fourteenth street, Oakland, California. Their reduction works at Keswick and Point Lewis, near Martinez, were not injured and they are in just as good condition as ever to furnish their chemical fertilizers. Write them at their new a dress for particulars, as they ma specialty of fertilizers for fruit, ce eals, vegetables, etc. All inquiries and correspondence will be promptl answered by addressing them abov

A Letter from J. M. Bull at King City, Cal

J. M. BULL.

IS THERE ANYTHING IN POULTRY?

There are some that say: "There is nothing in poultry." Why, I knew a man, who two years ago was broke, and lost his home, but, today, he is one of the wealthiest men in King City. That is Nick Bray, with 900 of the prettiest Brown Leghorns in California. He ordered $74.00 worth of Coulson's Feeds from the carload I sold at King City.

$300.00 FOR FEED—$900.00 WORTH OF EGGS.

During the past year, (1905), Mr. J. Christensen, of San Luis Obispo, Cal., fed his flock of 300 laying hens on COULSON'S MASH EGG FOOD, every day, and the total cost of all feed used, during the year, was $300.00. He sold during the year $900.00 worth of eggs, making $600.00 profit.

5 WEEKS' OLD CHICKS—3½ CENTS EACH.

Mr. Christensen hatched out 312 chicks, and he fed them entirely on COULSON'S GROWING CHICK FOOD, dampened with a little milk.

He purchased 5 sacks of it, for which he paid $11.75. When the chicks were 5 weeks of age, he had 310 good, strong, healthy chicks, only two having died; and out of the 5 sacks of feed, he still had a bucketful left. So the cost of feeding them COULSON'S GROWING CHICK FOOD up to 5 weeks of age, was about 3½ cents per chick, and raised 310 out of 312.

WHY YOU SHOULD FEED COULSON'S FEED.

Eight pounds of COULSON'S MASH EGG FOOD makes a meal for a hundred hens, and it takes nearly twice that amount of inferior feed, such as bran, shorts, chop feed, etc., which do not contain nearly so much protein.

"Can feed 1500 hens—'**COULSON'S**'—FOR LESS MONEY than what it costs to feed only 1100 hens on the other feed."

For instance: Mrs. Marks, at Salinas, fed 1500 hens all last year on COULSON'S EGG FOOD and it did not cost her as much as it did to feed 1100 hens the year before on common feed. That was proof that **"COULSON'S"** goes the farthest; therefore, is the cheapest. She now buys COULSON'S MASH EGG FOOD in one-half ton lots, about every two weeks. She gets it at Mr. F. Blackie's store at Salinas.

The COULSON'S Feed is so much richer, and a more solid feed. so that the hens cannot eat nearly so much of it. All the poultrymen know this—those who have fed it. The hens NEED the rich feed and if they are fed COULSON'S, they do not eat so much of the other feeds, so that is the **SAVING.**

Then, if you get only two eggs extra a month, that would pay for COULSON'S FEED, and from the other cheaper feeds, you would not get enough eggs to pay for the feed. You know a cow gives more milk and richer, when fed on a good, mash feed; so does a hen make more eggs, when fed on the right kind of feed that **HELPS TO PRODUCE THE EGG.**

Some poultrymen are mixing cheap Blood Meal, that is half tanbark, to make Egg Food, which they can readily see if they will only LOOK at it. It costs 4 cents a month to feed a hen COULSON'S MASH EGG FOOD and it also costs 4 cents a month to feed the cheaper feeds, as you have to feed so much more of them.

Then, two eggs extra would pay for COULSON'S FEED, and many months afterwards, you will be realizing the advantage of feeding **COULSON'S** Feed, for you will be getting so many more eggs in the late Fall, when eggs are worth 50 cents a dozen.

OVER $100.00 IN 3 WEEKS FROM 350 HENS.

Last November, when I was at Hanford. I saw a good illustration: One poultryman with 300 hens did not feed any of Coulson's Feed—he was then getting only 4 eggs a day.

Mr. V. E. Hill, another poultryman, had 350 hens and feeds **COULSON'S** EVERY DAY, the year round, and at that time eggs were bringing 53 cents a dozen at Berkeley and San Francisco and Mr. Hill sold $117.30 worth of eggs in three weeks, and there are four and a half weeks to each month. So you can see that the man who feeds COULSON'S FEEDS, makes a whole lot more money during the year.

IT'S THE SUCCESSFUL POULTRYMEN WHO USE COULSON'S FEEDS.

Men like Mr. Freeman, with 5000 hens, and all of his brothers, making from $2000.00 to $5000.00 a year, are men of from fifteen to twenty years experience, and only buy goods from which they will get good results. They buy carloads of COULSON'S EGG FOOD.

Mr. De Rezendes, who feeds nearly four carloads a year of Coulson's Feeds, made enough money by it, to enable him to buy another large ranch of 300 acres, which he will also st up with thousands of chickens will feed them on Coulson's Feeds. H buys COULSON'S SPECIAL DRY CHICK FOOD by the wagon load, three tons at a time, and the EGG FOOD, 300 sacks at a time.

Also Mr. Gaston, with 3500 hens, has fed 3000 bags of COULSON'S Egg Food during the past three and a half years, and uses tons of COULSON'S SPECIAL DRY CHICK FOOD every Spring. See illustration. Their word is worth as much, or more than that of the many smaller men in the business.

OVER $1000.00 WORTH OF EGGS FROM 400 HENS.

Mr. Selecman, a farmer, who owns a large wheat ranch near Elmira, Cal. started to feed his hens COULSON'S EGG FOOD two years ago. According to a careful record kept during the year 1905, he sold $1146.15 worth of eggs from a flock of 400 hens; and after paying for all feed, including some $200.00 worth of COULSON'S EGG FOOD, he cleared a profit from these hens of nearly $700.00.

$4.00 A HEN.

Why, Henry Graff, who was elected president of the Pacific Coast Poultry Association, and who has 2000 fine White Leghorn hens, feeds COULSON'S MASH EGG FOOD every day, and the last year his hens laid nearly $8000.00 worth of eggs, or about $4.00 per hen.

The Coulson Co. has over 80 carload agencies in California, handling the feed in carload lots, and hundreds of stores handling the poultry foods in smaller quantities. This is proof that thousands of poultrymen are feeding Coulson's Feeds and you should be feeding them too.

INTELLIGENT MEN, that's the kind that feed their chickens COULSON'S FEED and make money.

Geo. W. Gaston's mammoth poultry farm eight miles from Petaluma, Cal. Here is the section of the country where the world's largest poultry farms are located. Here we see poultry farms that are a mile square and covered with poultry houses, occupied by thousands and thousands of chickens. The laying hens on the above place have been fed on COULSON'S MASH EGG FOOD once a day for THE PAST FOUR YEARS, and during this time, Mr. Gaston has purchased for these hens, more than **3000 bags** of Coulson's Egg Food; besides tons and tons of Coulson's Chick Food for the little chicks.

35c per hen PER YEAR is what it cost Mr. Gaston to feed them every day on Coulson's Mash Egg Food; $1.10 per hen including all grain, etc.

Mr. Gaston is a practical and experienced poultryman, having raised poultry for the last twenty-five years. He is the owner of the above ranch, besides interest in other farms. The fact that Mr. Gaston uses Coulson's Mash Egg Food exclusively for his hens with such good results, speaks well for the merits of Coulson's Feed. Mr. Gaston is now raising 6000 little chicks on Coulson's Special Dry Chick Feed.

he Renovation of Worn-Out Soils

By W. J. Spillman, Agriculturist

For nearly two centuries after the advent of the white man in America farming was confined to a narrow strip of land adjacent to the Atlantic; crossed the Alleghenies, beginning the population was sparse, and when a field became worn out the nearby woodland was cleared. As population increased, the younger generation the tide of migration which has moved westward until the present time, but which has now occupied nearly all of the easily available lands from the Alleghenies to the Pacific. In its westward course this advancing host farmed virgin soils for a century. The marvelous development which has occurred in this country during the past century was made possible by the abundant fertility of the new lands brought under cultivation and the consequent abundance and cheapness of farm products.

So long as plenty of fertile land remained unoccupied in the West the exhaustion of the older land in the East was a matter of concern only to the farmers of the older settled communities. But now we are confronted by the necessity of tilling soils whose ability to produce satisfactory crops has been greatly impaired. There is even a perceptible flow of immigration from the high-priced lands of the Middle West to the depleted lands of the Atlantic seaboard. This has been made possible by the recent remarkable development of agricultural science, which has demonstrated the feasibility of restoring fertility to exhausted soils. Agricultural science is also responsible for the present movement from the city to the country. The conditions of country life have been alleviated; the farm has been made attractive by adding the zest of intellectual occupation in the splendid agricultural literature of the day; and farming, when intelligently followed, has been made profitable, even on lands that were formerly unproductive.

* * *

Differences in Natural Fertility.—There is a vast difference in the natural fertility of soils. Some do not produce well from the start unless special attention is given to making them productive; others produce large crops for a short time and then rapidly diminish in fertility; while others, known as strong soils remain productive for many years without attention to their fertility. But even the strongest soils will wear out in time unless they are intelligently managed. Curiously enough, as the tide of migration went westward in this country, the settlers found soils of increasing natural fertility as they went, and in each new settlement the opinion prevailed that the soil was inexhausible. But even the strong soils of the western prairies have now been cropped with grain and abused by improper methods of tillage until they show signs of approaching exhaustion.

Fortunately, while the rich soils of the West were being depleted of their fertility, the development of agricultural science was going forward with rapid strides, and, while there is much yet to learn about the soil, we now know, in a general way, the steps necessary to build up and maintain soil fertility. In fact, soils that were originally only moderately productive and that have been rendered almost sterile by improper methods of farming, can be made richer than they ever were.

* * *

Nature of the Soil.—In order to understand the methods necessary for restoring worn-out soils, let us consider what occurs in a fertile soil that is growing a large crop. Imagine a cubic inch of ordinary field soil magnified into a cubic mile. It would then present very much the appearance of a mass of rocks varying from the size of a pea to masses several feet in diameter. Scattered among the rock masses would be many pieces of decaying plant roots and other organic matter, resembling rotting logs in a mass of stone and gravel. The masses of organic matter would be found to contain large quantities of water, and to somewhat resemble wet sponges, while every mass of rock would have a layer of water covering its surface. The open spaces between the solid masses would be filled with air.

American Wonder Pea

If a crop were growing on this soil, its roots would be found threading their way among the masses of rocks and decaying roots, and pushing these aside by the pressure exerted by the growing root. From the surface of the growing root, near its tip, small hollow threads (the root hairs) extend into the open spaces and suck up the water covering the rock particles. The root hairs are not open at the end; they absorb the water through their walls. The plant food is dissolved in this water, but is usually present in exceedingly small quantities. While the plant is growing a constant stream of water flows up through it and evaporates at its leaves. For every pound of growth in dry matter made by the plant, from 300 to 800 pounds of water flow up through it.

The plant food substance dissolved in the water may be divided into two classes according to their ultimate source.

* * *

Mineral Plant Food.—Plants in their growth make use of thirteen chemical elements, nine of which they secure directly from the soil. These are called the mineral plant foods; they are phosphorus, potassium, calcium, magnesium, sodium, iron, silicon, chlorin, and sulphur. We have already seen that the soil consists mainly of small particles of rock. The rock particles are of many kinds, but nearly all kinds contain more or less potassium, calcium, phosphoric acid, etc. Every year the soil water dissolves off a thin surface layer from each particle. Plants appropriate this water and thus secure mineral plant food.

Many generations of plants have thus been collecting their small toll of food from the soil and storing it up in their tissues. The amount of plant food made ready for plant use during each growing season through the slow solution of the mineral particles of the soil doubtless supplemented to a considerable degree by the same kinds of material set free from the organic matter also found in the soil—that is, the mineral matter originally secured from the dissolved minerals, but built into plants during some former season, may again be used by other plants when the old matter is given an opportunity to decay in the soil. These foods derived directly from the mineral matter of the soil and indirectly from it through the growth, death, decay, and return of former crops are also supplemented in many cases by the application of mineral matter in the form of commercial fertilizers.

* * *

Nitrogen Compounds.—In addition to the nine elements already mentioned, the growing plant requires four other elements, as follows: Hydrogen, which it secures from water (water is a compound of hydrogen and oxygen); oxygen, which it secures partly from water and partly from air; carbon, which is secured from carbonic-acid gas in the air; and nitrogen.

Nitrogen is in many respects the most important of all the plant food elements. It is not found in appreciable quantities in the rock particles of the soil. Ordinary plants depend for their nitrogen entirely on decaying organic matter. As decay proceeds nitrates are formed from the nitrogen contained in organic matter. The nitrates are exceedingly soluble, and unless soon made use of by growing crops they are washed out of the soil. Nitrogen is therefore usually the first element to become exhausted in the soil.

Fortunately, there are certain species of bacteria that can use atmospheric nitrogen, of which there is an inexhaustible supply. One family of plants—the legumes—has learned to exchange work with these bacteria, and these plants are thus easily supplied with an abundance of nitrogen in a form they can use. When these nitrogen-fixing bacteria are present in a soil on which a leguminous crop is growing, the bacteria invade the roots of the legume and live there. Their presence is usually made manifest by swellings—the so-called tubercles—on the roots of thrifty plants of clover, alfalfa, beans, and other legumes. Nitrogen from the soil air filters into the roots, where the bacteria appropriate it, manufacture an abundance of nitrates, and give a portion to the plant in exchange for starch. The tissues of leguminous

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

GROWING ALFALFA

Editor of Cultivator:—Would it be practical to undertake to raise alfalfa on No 1 land where there is no irrigating ditches? The water supply would have to be procured from wells at a depth of 40 feet. I have 480 acres of first-class land in Tulare County outside of the irrigating districts which is of hogwallow formation I am anxious to put to alfalfa. I am not posted enough in the business to know if it would be advisable to undertake to grade it and put down wells, using a portable engine to pump from the different wells. I have read a great many articles in the Cultivator on alfalfa raising that sound very flattering. Can you give me any information on the subject? WM. T., Berryessa.

It will pay to raise water forty feet to irrigate alfalfa where the land is capable of being flooded. Where hay is cheap, we would be inclined to turn our attention to hog raising. By devoting part of the land to barley and allowing your hogs to harvest the alfalfa by turning them from one field to another and allowing the hogs which are being "topped" off for market to have first chance at the barley fields and allowing the stock hogs to clean it up, there will be comparative little expense in caring for such an enterprise. Of course you would need to harvest some grain to carry your stock hogs over certain periods when feed is scarce. The expense of leveling hogwallow land for irrigating alfalfa might be too expensive to render it profitable. It depends on the degree of undulations. There is hogwallow land and hogwallow land. We never yet have seen what we would call first class land, though there may be such a thing as hogwallow land that is first-class in the sense that a man may be a first class criminal. He is a first-class man in that respect. Such land has hardpan at no great depth and in consequence cannot be first-class for any kind of farming purposes.

* * *

HISTORY REPEATS

The Rural New Yorker in commenting upon the Stringfield method of pruning the roots and tops of trees before planting, says that this method has been of great service in showing that it is not necessary to retain nearly as much top and root as was formerly supposed. They are now cutting the tops of the trees down to 12 or 18 inches and are cutting the roots much shorter than formerly.

Now had the fruit growers of the middle states visited California twenty years ago, they would have seen this sort of thing in practice in every prominent fruit growing section of the great valleys. We remember visiting an old orchard of 400 acres in Sutter County, California, some twenty years ago, and all the trees had been cut at planting time to a stalk 12 to 18 inches long. The orchard had been planted some 10 years before that time, making them thirty years old now. It is still a productive orchard and a good income property. Now the growers in the middle western states have just learned from Mr. Stringfield that it is just as well and perhaps a little better to do as we have been doing for thirty years. Nobody in California seems to take any credit for evolving this method that has been in use for so long, it was simply worked out by a dozen or more growers at about the same time; the incentive that set them to thinking about it being the fact that the sun burned the trunks of the trees unless protected, and incidentally, the extra expense incurred by having to use long ladders. When growers found that the inconvenience of cultivating beneath a tree that branched within a foot of the ground was insignificant compared with the benefits derived from the increased vigor due to the natural shading of the trunk by the low-hanging branches and when the advantage of being able to pick most of the fruit from the ground for a number of years was added to the other advantage, the subject was settled in short order and the method was not discussed any more, it having become a settled question.

As to the root pruning part, it has been the custom always to trim the roots with a clean cut before planting. This with the loss of roots when digging from the nursery resulted in about half of the root system being removed. We feel impelled to reiterate these methods because there seems to be an impression that a new method has been evolved from the Stringfield method, when in reality, a practice that has been in vogue in California for over thirty years is just beginning to attract attention in the middle and eastern fruit growing sections.

There has been considerable severe criticism of Mr. Stringfield's horticultural ideas, but he has been thinking and of course that means progress. More credit is due him than there is to the California growers who were driven to their practices by necessity occasioned by our climatic conditions. Mr. Stringfield had considerable prejudice confronting him at the outset and while he was on the right track, his extreme methods not proving applicable to universal conditions, yet working well with him, he has been the cause of bringing into use, improved methods in horticulture.

THE APPLE CURCULIO.

This insect is related to the more common form known as the plum curculio, having a somewhat longer snout and being a little larger. Professor C. S. Crandall, of the Illinois Experimental Station, has done some interesting investigational work in looking for a remedy for this insect pest, says the Apple Specialist. In his work he found that the insect pupates in the ground. He examined the soil beneath the apple trees carefully and found that the insects do not enter the ground to a great depth, so that in the pupa state they are more easily destroyed. Of one hundred and seventy-nine curculia, forty-five of them were found at a depth of half an inch; fifty-five of them were at a depth of three-fourths of an inch; forty at a depth of an inch, and the remaining eighteen were found at depths ranging from one to one-fourth inches to two inches. Thus the insects can be destroyed by giving the orchard clean cultivation while the curculio are in the pupa state.

Professor Crandall's experiments developed the fact that most of the insects go into the ground from the 5th to the 25th of June and emerge as adult beetles during July. So that it is apparent that if the trees are given clean cultivation during June and the first part of July the injury from curculio will be greatly lessened.

Another remedy suggests itself here, and that is the use of poultry in orchards. It is a well known fact that plum trees which are located in the poultry yards bear fruit, and now that the plum curculio is at work in apple orchards an added reason has been given for the keeping of poultry in apple orchards.

Inasmuch as the plum curculio works on peaches as well as on plums, peach trees should not be planted in apple orchards. Illinois growers who have had peach trees among their apple trees have reported that their apples have been much worse injured by curculio than fruit in orchards more remote from peach trees. At all times avoid mixed planting of apples and peaches. There are other objections to this practice, but this is one of the most important.

PEACH BLIGHT.

There is no denying that the peach blight is doing great damage in this valley this year. Practically every locality in the county is badly affected; young trees are not nearly as bad as old ones, but the growers are alarmed as to the future of the industry here. They have in mind the experience of the pear growers who lost their trees by blight.

There was a recent article in the Cultivator explaining why climatic conditions of Southern California are not conducive to profitable peach culture, and it has been noticed that these conditions have existed here the past winter, that is, a warm February, which started growth and sap, and then a cold and damp March and sudden checking of growth just at the time of blooming when the flow of strength should be most vigorous. While the tree is in this weakened condition it is probable that it is susceptible to fungus disease for which spraying is recommended by our experts. I think spraying with Bluestone solution should be practiced by growers both in fall and spring, which with weather conditions again more favorable may restore the trees. Some growers think that spraying early this season has saved them a crop for this year while others say the spray has had no effect.

The industry is of too great importance to let it go without a hard struggle and every grower should make it a study and apply any remedy which may prove beneficial.—H. G. H., Fresno.

FARMING IN THE SCHOOLS

This movement for the introduction of agriculture into the schools seems to be a sane reaction timed to meet a great need. As a matter of fact, there is no dearth of agricultural knowledge. The work done by the United States Department of Agriculture is good in quantity and quality, but it does not reach the farmer as a class. The same may be said of the work of our agricultural colleges and training schools. There is needed a connecting link between the work done by these and the people for whom it is done, if it is to be made generally available. The farmer lacks not so much in intelligence along these lines as in interest. The development of this essential interest in things out of doors may well be entrusted to our schools under competent supervision. The basic facts of the relations of the plant to soil, light, heat and moisture are probably no more difficult to teach or to learn than is the "rule of three," the extraction of cube root, or the conjugation of a verb. Such work as this, always considering that it is limited by common sense in the presentation, will enrich any course of study, whether intended for use in city or country, for it comes within the category of things which everyone should know. They are cultural as well as agricultural.—Edward Huges in Sunset Magazine for April.

Make yourself a necessity to the world by what you contribute in the way of personal comfort, by what you are in embodying before men all that is gentle, generous, and pure.—M. Dana.

Practical Farm Science

BY PROF. A. J. COOK

BEE FEED

Near the east end of the famous Leipsiger-Straus of Berlin, is the honey emporium of this great capital city. Here, more than anywhere else, can be seen and studied the methods of honey production as practiced in this country. Here we may see honey in all styles as sold in the city. Hives, beebooks and all sorts of apiarian apparatus as illustrating the practice of German beekeepers. I was most interested in three kinds of candy manufactured and sold here, one a chocolate mixture, in which honey is the leading ingredient. Each of these I find to be delicious, and their sale must be not only very remunerative, but must make call for a large amount of extracted honey. The owner of this establishment is none other than one of the most distinguished beekeepers of Germany, Mr. Schulz, who was the first I believe, to manufacture the "bee candy" known in America as "Good candy," so called from one of its inventors, a Mr. Good, who lived at the time of its invention in Indiana. This candy is used exclusively in shipping queens and is valuable for other purposes. It is made by mixing together extracted honey and pulverized cane sugar in such proportions as to form a pasty mass, and thus resembles strikingly candied or granulated honey, so familiar to us all. This however is to be preferred, especially for shipping queens, as its consistency can be regulated precisely to our liking. This Good, or Schulz candy, is like butter, in being pasty, and so can be easily crowded into the augur holes of the queen cage and with no addition of water or other food of any kind this can be used with such perfect success that the queen bee and her attendants —ten or twenty nurse bees—are easily and safely shipped around the world. As these may go by mail, a two-cent stamp is enough to warrant their safe delivery even in far distant Australia or New Zealand. This Good candy may also be used in case we must feed our bees and is easily and safely fed by simply crowding it between the tops of the frames. It is especially to be recommended for winter feeding in regions of cold winters. I need hardly say that candied or granulated honey may be fed in the same way.

* * *

Schulz Hives.

The apiary of Mr. Schulz is extensive. He has hundreds of colonies of bees. I have not as yet visited his bee yard but shall do so soon, and will then give our readers the valuable features as exhibited there. I have, however, examined the Schulz hive, kept for sale here in the city. It is a long hive, much like the "new idea" hive, so much talked of in the United States States a few years ago. The frames are not much different from those used in America, but the hive is without movable top. That is, it is thoroughly closed and nailed from above. Thus the frames must all be moved out at one end. This is so tedious and awkward that I am sure no American beekeeper could be induced to use such a hive for a week. Certainly not longer than it would require to change the bees into a top opening hive.. I think even in Germany where the people are very patient and slow to anger, or at least to show excitement, that these hives will not be opened very frequently. I dare say that in many cases they are practically hives with non-movable frames. I am free to say that to my mind nothing shows more graphically the non-progressive habits of the working classes of Germany than the fact that such hives are of common use. Indeed, next to the old straw skep, they are the prevailing hive of this country.

HOW TO RAISE QUEEN BEES

Queens are raised by two methods, one the swarming or natural, the other the forced or artificial method. Both have their advocates, but the preference of many is with the artificial. I select a colony that is good natured and has workers. From that colony I take the queen, and two combs with the bees on them. I put them into another hive and give them an empty comb or a frame with a sheet of foundation in it, then set it on a stand somewhere else. In place of the two combs taken, I put a division board at the outside of the brood nest after bringing the combs together. Then put the honey boxes on and close up the hive.

I go to the hive I want to raise my queen from. Into the center of this hive I place a frame that is half full of good old worker comb, close up the hive and let both alone for at least four or five days. I then examine the comb for eggs and larvae and expect to find some new comb built at the lower edge of the comb that will contain eggs and larvae. I set this comb and the bees on it (brushing off the queen into the hive if she is there) into an empty hive and cover with a cloth. I now go to the hive that I took the queen from, and examine that for the queen cells already built. If I find any capped, I tear them out. Those that are uncapped I pick the grubs from and with a goose quill toothpick I take a minute grub from the comb I took from my selected queen and replace all the grubs I picked out of the queen cells. I then sweep the bees off the selected comb in front of the hive they belong to, and cut off the lower edge of the comb clear across where the eggs are just hatching into grubs. I then take out one of the division boards, separate the brood nest in the center, put it in my selected comb, and close up the hive as it was before.

Queens raised in this way between July 1 and 20, are ahead of natural swarm queens. While the bees are building queen cells and capping them, which takes from five to eight days, I trap the drones and kill them from all the hives whose bees possess undesirable qualities of any kind. Keep them trapped off or shut in until after the young queens are all mated.

H. L. J.

MINNESOTA AT THE HEAD.

Minnesota dairymen and butter makers are justly proud of the many triumphs won at the national creamery shows during recent years. This year Minnesota butter stood head and shoulders about the butter of any other state. The National Creamery and Buttermakers' association has during the last seven years offered seven banners, one each year, for the highest average butter from the various states. Minnesota has secured five of those banners. Illinois one and New York one. This year Minnesota took the gold medal for the best tub of butter exhibited.

PRAIRIE DOGS KILLED BY SOAP

John F. Braun, a farmer near Miltonvale, Kan., had about 100 prairie dogs on his farm and started in to wipe them out. He used traps. After he had caught about thirty the rest got wise and would walk around his traps. Among the thirty was one that the trap didn't injure, and he put in a cage for a pet. By mistake his children fed the prairie dog in the cage a small piece about the size of a hazel Within five minutes the prairie dog was dead. Mr. Braun decided to experiment. He cut a bar of soap into small pieces about the size of a hazel nut and threw a few pieces into each hole in "dog town." The next dav there wasn't a solitary prairie dog left to tell the story. All were dead. Ten cents worth of soap will clear a big farm of prairie dogs.—Kansas City Journal.

California Horticulturally

NO GIPSY MOTH IN CALIFORNIA.

A request made some time since by the Commission of Horticulture for caterpillars of different species to be sent for identification to San Francisco has given rise to a statement that the Gipsy Moth was with us. Such is not the case, but it is desired that people finding caterpillars with which they are not acquainted to send them to the Commission for identification. There is always danger, even though remote, of introducing new pests, and it is desired to know of the existence of every species in order that if a new one should appear it may be checked at the outset.

THE FLAT-HEADED BORER.

The destructive tree borer so well known to horticulturists as the Flat-headed apple tree borer and to entomologists as Chrysobothris femorata has become sufficiently established in some parts of Arizona to demand attention. This region has remained remarkably free from injurious insects; but during the past two years at least the above named borer has done much to hasten the death of full-grown orchard trees that have been injured by heat, and has destroyed many newly-set ones. Last summer several young apple and plum trees were killed by it at the Station farm before its presence in them was suspected, and others report the loss of young trees as a result of its depredations. Examination of whose merits entitles them to that adlarge peach, plum and quince trees that appeared to be dying from the effect of the sun revealed the presence of the borer in most cases.

This insect is found in all parts of the country, and annually destroys vast numbers of trees. It attacks apple, pear. quince, plum, peach, cherry, ash, elm, maple, box-elder, sycamore and willow trees.

The injury is done by the flat-headed borer during its grub or larval stage. The adult insect is a beetle about half an inch long, flattish-oblong in form, shiny greenish-black above and copper colored below. The female deposits her eggs in the crevices of the bark of the trunk and main branches, usually on the south or southwest side, where the effect of the sun upon the trees is greatest. At the station the most of the eggs are probably laid during April and May. Although eggs are sometimes deposited by this insect upon healthy, well-established trees, it evidently prefers to select sickly or newly transplanted ones, especially those whose bark has been injured by exposure to the sun.

The eggs hatch within a few days after being deposited. The young larva soon eats through the bark and proceeds to bore at some depth beneath the surface, leaving behind it a flattened channel. Somtimes a single borer will girdle a tree and cause its death. The larva reaches its full growth by the end of the summer, being then a pale-yellowish grub about half an inch long, with a broad flat head. During the winter it remains quiescent. The next spring it bores out nearly through the bark, then moves back a little and undergoes its change into the adult beetle form the transformation being completed in about three weeks. The beetle then cuts an opening through the bark and escapes to continue its work of destruction begun by its ancestors. During the warm part of the day it may be seen flying about in the hot sunlight

There are three ways of combatting the borer: (1) by destroying the grubs while they are at work in the tree, (2) by the application of some substance that will prevent the eggs being deposited or will destroy the eggs and newly-hatched larvae, and (3) by wrapping the trees with something that will prevent the females gaining access to the bark. But, by the best methods known, borers are difficult insects to combat. The larvae make their way into the wood soon after the eggs are deposited and keep so completely out of sight as they work, that they may do injury before their presence is suspected, and are difficult to kill when detected. It is a case where an ounce of prevention is decidedly more effective and more economical than a pound of cure.

When the borers have entered the tree, they may be destroyed by cutting them out or by killing them in their burrows with a pointed wire if they are not too deep or too far from the point of entrance. In some cases where they cannot be reached with a wire or cut out without seriously injuring the tree, they may be killed by pouring kerosene or hot water into their burrows. The location of a borer is usually indicated by a slight discoloration and flattening of the bark and by the exudation of sap.

A great variety of washes have been used for preventing the female beetles from laying their eggs upon the trees. The following is probably as effective as any that can be safely used without danger of injury to the bark. Dissolve one-half gallon of soft soap or five pounds of whale oil soap in one-half gallon of hot water, and add a half pint of carbolic acid. When mixed add five gallons of warm water and enough lime to make a whitewash of about the consistency of paint. Finally stir in one-fourth pound of Paris green Apply the wash in April before the eggs have been deposited on the trees and again in a few weeks. All cracks and crevices must be filled and the bark thoroughly and completely covered, a stiff brush being best for the work. It must be understood that the work has no effect upon the borers after they have once entered the tree, but is intended to prevent the depositing of the eggs or to kill newly-hatcher larvae before they have entered the bark.

But the use of something that will not only protect the trees from the attacks of the borers, but from the heat of the sun, is more useful and economical than a simple wash. As has been stated, the parts of trees injured by heat are more liable to the depredation of borers than the healthy uninjured portions. Therefore, anything that will prevent "sun-scald" and will at the same time keep off insects will be a double benefit to the tree. A very effective, and at the same time inexpensive cover for the trunks and main branches is one of newspapers and wrapping paper. If several thicknesses of the paper are wrapped about the trees, beginning a little below the surface of the soil, and then tied with a weak string that will not cut the tree as it grows, very effective protection is secured. It is important that there be no openings that would admit beetles. Drawing some soil about the base of the wrapper will close it at the bottom, and seeing that the wrapper fits closely at the top will prevent entrance at that point. Instead of the paper, wrappers of thin, flexible sheets of wood such as are used in basket making may be used. The bottom may be closed with soil and the top with cotton wool. Either wrapper will protect trees from the injurious effects of the sun.

It is important that all young trees be protected in the future, especially during the first season. Failure to take this precaution may result in the loss of the most of the trees of a young orchard. Even if there were no danger from borers, it would be advisable to put on the wrappers of paper or wood to protect young trees from the sun. If the trunks are artificially protected until the branches have extended far enough to shade them much more vigorous orchard trees will be secured. In this connection, it may be well to call attention to the importance of heading trees low that the trunks may be better shaded by the tops.

FIELD PEA

The field pea has few varieties. It has in general colored blossoms and the seeds are more or less spotted with brown. The field pea is chiefly used for fodder; but one variety, the Canadian field pea, is considerably used as a table vegetable, and in California is much used for green manuring. When two-thirds grown it is said to be delicate and well flavored, and it has the advantage of a longer season than the garden pea. As a dry pea it is inferior, as it does not cook soft.

NEW FOUR-ROW SPRAYER
AT A BARGAIN

Having sold my ranch, I offer this fine Iron Age Four-Row Sprayer at a nominal price.

I ordered this Sprayer last year, but it did not arrive until the close of the season and is therefore practically new. It is operated entirely by horse power, being built somewhat on the order of a one-horse hay rake. It sprays four rows of vegetables at one passage and can also be used for spraying trees.

With the Citrus Growers

BY J. W. MILLS

ORANGE POSSIBILITIES

We were telling a Redlands man the other day of a fine lot of oranges that were grown in a Riverside orchard, running about forty per cent fancy. He said: 'Oh, that's nothing, we have some orchards that beat that." We went around to the Exchange packing house and the bookkeeper showed us records where one ten-acre tract turned in fifty-two tons of oranges that went 68% fancy, 25% choice, 5% standard and 1% culls. We that that was pretty fine but he said we will go and look at an orchard that beats this. This orchard was located far above Mentone against the side of the mountain on a rather heavy clay loam, on a small backbone that had rather steep slopes on each side, protected by high mountains on the north, east and south sides. It is on an ideal soil protected from frosts and wind, very warm and consequently matures the fruit very early. In the December pool, the fruit ran 95% fancy and averaged about 65% for the balance of the crop. This man has used very little commercial fertilizer and he uses all the stable manure he can get, but it takes him three years to get over his thirty acres.

It would be impossible to make a record like this in any exposed location and doubt if it is possible to bring about such results artificially. In the first place we do not know what produces them and if we knew we could not find natural situations of any extent in which to do it. When it comes to doing horticultural things in a "gilt edge" style we must leave it to nature to a great extent, still these cases serve to guide us along certain lines for there are always little contingencies that arise in such cases that give us certain ideas from which we may derive profit. In this particular case, we were thoroughly convinced that it does not take an abundance of fertilizer on ordinarily rich ground to give the best results. The trees were 15 years old, average about six boxes per tree and about 80% of the fruit packed fancy. The mechanical condition of the soil has been kept good by growing green crops. Had this orchard been exposed to the elements that invade 99% of our orange groves, it would have been impossible to have achieved such results.

The seed farms of California furnish about one-half the world's supply.

A FEW OF THE GOOD REASONS

why you should buy the Armour fertilizers.

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

They are made, from the best materials obtainable, months before they are shipped out, thus being thoroughly cured and blended.

Each element of plant food is derived from a number of different sources of varying degrees of solubility, thus furnishing a continuous supply of plant food.

They back up our arguments with The "Irresistible Logic" of Results.

THE ARMOUR FERTILIZER WORKS
736 Hellman Building, Los Angeles--Factory, Colton, Cal.

CITRUS TREE PLANTING.

On account of the cool weather in April it is possible that May planting will be equally as successful, but as the weather is warmer then the trees require more careful handling. Trees put out in the early part of April show no signs of wilting and will commence to grow right along whenever the roots begin to take up nourishment. Summer planting can always be successfully done, but as a rule early plantings stand the cold weather better during the following winter. In April trees could be moved with naked roots, and so can they in May, but unless the planter knows his business thoroughly, he had better not run any risk, but have them balled. They will be likely to be more successful if partly dug and the tap root cut a few days before moving.

* * *

Watering Trees—In early April watering newly planted trees can be safely deferred for a few days, but in the month of May the best success will be found to follow watering soon after moving, and also having as short a space of time elapse between digging and planting as possible.

* * *

Trimming—Trimming of citrus trees should always be done before commencing to dig them, as the tops are apt to suffer some for cutting off the circulation by shortening the roots. Nevertheless a second light trimming is often beneficial after planting, to promote the uniform appearance of the trees and also to restore the balance between roots and top. An orange tree is not like a deciduous tree, for its leaves are always making drafts on the roots for moisture to supply loss from evaporation.

* * *

Replanting—If a newly moved tree does not freshen up by next morning after planting and irrigation, but keeps wilting and going back, it is not a sure sign that the tree is going to die, but if the orchardist wants all the trees in the orchard to be uniform it will be better to root all such wilted trees up and replant with a new tree. In the cooler weather of April trees need not wilt at all, but keep right on growing and perfecting the young growth, but in May the young growth is pretty sure to be sacrificed. By replanting thus early there will be none of those gaps in the orchard that often mar its symmetry for years.

* * *

Varieties and Budding of Seedlings.—In oranges the navel is easily ahead of all other varieties, and the seedling is now no more thought of than would be a seedling of an apple, apricot or other deciduous fruit tree. Not only this, but many are budding twelve and fifteen year old seedlings to the navel with good success. The custom used to be to cut back heavily in the spring, so as to make a growth of new wood to bud on in the fall, but this practice is being discarded for direct spring budding. With large trees many buds must be put in, so as to furnish plenty of young shoots when the old top is cut off. Many claim that there is but little loss in thus changing old trees to other varieties, and that, if successful, the increased price for the finer varieties more than pays for the first five years.

* * *

Grape Fruit—Those who have mild locations can grow the grape fruit. This tree is about like the lemon in that respect. Since it has been found that the bitter principle in this fruit is health-giving, there has been quite a demand for it in Eastern cities as a spring medicine.

Our subscribers noticed on the last page of last week's paper in which we referred to the Los Angeles County Farm bringing into the county $10,500 as a result of the selling of Valencias, with three cars yet to be shipped, for this season's output. This is an increase over last year of almost one hundred per cent. It is only just to state that this result has been largely due to the high state of cultivation and especially to the good work of Mr. Collins, of the A. C. W. Fertilizer House of Los Angeles, who has had charge of the fertilizing of these trees for several years. The A. C. W. brand of fertilizer has been used on these trees and doubtless no small part of the $10,000 income this year is due to the worth of that brand of fertilizer.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

DAHLIAS.

Except for private collections and for exhibition purposes, it is a mistake to bother about numberless varieties, find out the really good varieties of each color in each class, then select a reasonable number of sorts to plant, and plant a sufficient number of each variety and color to produce enough flowers during the time dahlias will last. It often happens, when a great number of varieties even of cactus dahlias are grown, that there is a lack of flowers of one variety of the color that is wanted. It is also the best plan to plant each variety by itself, to save when cutting the flowers. There are very few show or fancy dahlias of much benefit for florists' use, and for that reason, and because of the many good decorative varieties available, there are but few of the former grown for cutting. Dahlias promise to be fully as popular the coming season as ever; the cactus sorts more so than any other type, with the gorgeous Century singles a close second both for planting for decoration of grounds and for planting to cut from.

BERMUDA LILY BULB GROWING.

The outlook for the commercial production of lily bulbs was found to be even beyond expectation, splendid bulbs being produced in California from seed raised by George W. Oliver in the Department greenhouses. Mr. Oliver says in regard to this work:

"During the summer of 1094 a considerable quantity of home-grown lily seed was distributed to growers on the Pacific Coast. This seed germinated well in the open and the seedlings stood the winter temperature successfully. Although the seedlings were not planted in the fields the progress made in the seed beds showed that this might have been done to advantage. Bulbs of the Bermuda lily which had been raised from seed in the greenhouses of the Department in 1904 were also distributed, and the growth made from these show that some parts of California are even more favorable to the growth of Easter lily bulbs than Bermuda. Some of the plants within two years from seed had no less than thirty-six blooms to a stalk, with no trace of disease on the foliage. The scales from these bulbs will be planted this season to ascertain how far this method of propagation will succeed under the conditions existing on the Pacific Coast.

DECORATION DAY PLANTS

There was a noticeable increase in Decoration Day business all over the country last year, with a still more noticeable increase in the number of plants used for that occasion. Formerly it sufficed to place some flowers on the graves, but now organizations and individuals strive to make a more permanent decoration as a token of respect to the memory of the departed on that day. The inauguration of this commendable custom is of material interest to growers and dealers as is any movement having a tendency to increase the demand for their products; and it seems for that reason, if for no other of a more sentimental nature, they should do everything possible to encourage its growth until it becomes a firmly established national annual obligation on the part of the living to the memory of the departed. An attempt should be made to make a specialty or specialties of subjects appropriate for the purpose by advertising and otherwise, just as at present there are special things understood to be appropriate for Christmas and Easter festivals.

PLANT NOTES.

The person who plants shrubs should be sure of what they are planting. He should select kinds which are hardy and beautiful, and able to get along without much attention after they are once established. Popularity is not a reliable guide in the selection of shrubs, unless it is based on merit. If this truth is kept in mind it may prevent the amateur gardener from expending a goodly sum of money on a shrub that is advertised into popularity, while the money so expended would have bought several shrubs whose merits entitles them to that lasting popularity which does not depend on advertising puffery. We do not want a shrub for its high-sounding name, its foreign pedigree, or its aristocratic associations, but for its beauty. Never lose sight of that fact.

It is absolutely impossible to create a healthy race without an abundance of fresh air. Seeing that it is impossible on the score of expense to convert our cities into places where a healthy community can be reared, the railroads must be utilized as never before to carry the bread winner rapidly between his place of business in the city to his suburban or country home.

Along the track of each railroad that radiates from the city a series of residential parks, or garden cities, should be built extending for 40 or 50 miles away, the more distant to be reached by express trains. These garden cities should be beautifully designed beforehand by architects who are also artists in landscape gardening. The individual cottages will occupy not less than 100 hundred square feet of land, or four ordinary city lots, affording a flower garden around each home. The avenues will be always curving and the village green or city park will be a frequent place that gladdens the eyes of all who frequent it.—Outdoors.

VIOLETS.

There is probably no flower in all the floral kingdom that is so dearly loved and appreciated as the violet. No one who has a garden but what must have a violet bed and luxuriate in its flowers. Anyone can grow the sweet things who is willing to give them proper care and attention.

The place selected for violets should be level, the ground covered first with well rotted manure and thoroughly spaded in and carefully worked and raked over. The plants should be put ten to twelve inches apart and sufficient space left between the rows for the plants to grow and leave a good path. Strong runners should be planted as the hard old stools are worthless for replanting.

The plants should be watered three or four times a month, the frequency depending on the state of the weather and evaporation. They should be mulched with rotted manure to keep the soil from baking on the surface, and should always be hoed and carefully cultivated a few days after watering.

The following are leading varieties: The California, a fine large single violet with long stems; very fragrant. It created a perfect furore when it was first introduced, and is still valued, but has a formidable rival in the lovely Princess of Wales, a special variety which has bordered petals and a more soft shade of blue; fast becoming the "trade" violet of the State. The stems of the flowers stand high above the foliage, which adds to their beautiful effect. A new favorite has appeared named La France, which is said to have much larger flowers and even a prettier blue color than the Princess, while the fragrance is delightful. The stems are also much longer.

The dainty little perpetual single violet,, though it cannot compare with the new varieties in size, will keep its place, for it gives its sweet flowers all the year.

Queen Victoria is a strong growing single violet with good sized flowers, different in form from the Princess or California. Among double sets, the Farquhar has enthusiastic admirers who claim it will supercede all others. It is very large and double, on very long stems, with magnificent flowers of the darkest deepest blue imaginable. Contrasting with it is the Lady Hume Campbell, a charming light blue variety.

Mad. Millet, called the pink violet, is a dainty one, with quite small foliage and flowers a beautiful pinkish mauve.

Marie Louise is a dear old friend of violet lovers, and will always be appreciated. Its exquisite double violet blue flowers are beautiful and claim the same admiration they have of yore. Swanley White is yet the only double white one of value. It has lovely double white flowers exactly like Marie Louise except in color.

Le Parme is a charming sort with dark green foliage, and very dark blue double flowers, it flowers when other varieties have bloomed and gone.

Viola pedunculata is a native of the Golden State. Golden in color with a dark brown eye. It is a bright, pretty flower with scent of peaches. It would be interesting to cross it on one of the single varieties. Some valuable sorts might be obtained.

A collection of violets would be a source of great pleasure and give many beautiful flowers for several months.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

SHADE TREES and EUCALYPTI
Also a fine variety of Eastern trees, such as Lindens, Maples, Horse Chestnuts, White Elms, etc., all well established in cans. Dracenas, Palms, Roses, Ferns, etc.
SYCAMORE GROVE NURSERIES
SAINT & WARNER 4584 PASADENA AVE., LOS ANGELES

ROSES
All the best garden sorts, in fine vigorous plants, at proper prices.

"PREMO" SWEET CORN
IS READY TO EAT FIFTY DAYS AFTER PLANTING
Premo is adapted to the cold nights of the Pacific Coast—grows rapidly—produces abundantly. Will raise a fine crop of succulent, tender ears, under conditions that would stunt any other corn.
Premo bears an abundance of uniform sized ears—the kernel is crisp, creamy and deliciously sweet—is not tough or stringy. Premo is so hardy that it will bear planting two weeks earlier than any other Sweet Corn.
It pays Market gardeners to raise Premo as it is on the market three weeks before other varieties.
Prices: Sold only in sealed packages. Pkt. 10c.—1 lb. 25c, prepaid. By freight or express at purchasers' expense. 1 lb. 15c.—4 lbs. 50c.

Our Specialty Burbank Crimson Winter Rhubarb
APRIL, MAY and JUNE is the best time to plant for a heavy crop next winter. $1.50 per dozen, $7 50 per 100, $50.00 per 1000.
We still have a few thousand Fancy Navel and Valencia Orange Trees.
Wagner's Nursery Phones: Home, 1291; Sunset, 1297 Pasadena, Cal.

..MORSE SEEDS..
They are seeds of the highest class and superior quality.
Address
C. C. MORSE & CO.
815-817 Sansome St. SAN FRANCISCO.
for Garden and Flower Seeds, Field, Grass and Clover Seeds.
We have the best seeds that grow, and you should plant them, whether you are interested in seeds for pleasure or profit.
It will soon be time to plant your Corn and Beans, Cucumber, Watermelon and Muskmelon Seeds, and we have fresh, pure seeds of all the best and standard varieties.

In the Vegetable Garden

BY ERNEST BRAUNTON

RUST-RESISTING CANTELOUPE

The canteloupe rust or blight has for a number of years seriously injured the canteloupe industry in Colorado and in the vicinity of Rockyford. In dry seasons the disease may not excite much notice, while in seasons subject to rains and dews its development is very disastrous to the crop. The disease is caused by a parasitic fungus (Macrosporium cucumerinum). Attempts by the station to control the disease by the use of Bordeaux mixture have failed. The station has issued a bulletin on the subject.

In 1903 it was observed that some of the plants in a number of fields which had been grown from a single strain of seed were much more resistant to the rust than others. Seed from these immune plants was obtained and planted in 1904 and likewise in 1905. A large proportion of the seed from these rust-resistant plants produced a large growth of vines and large solid melons with firm flesh and small seed cavities completely filled with seed, while unselected seed produced plants greatly injured by the rust, with small melons which ripened prematurely, thin watery flesh, large open seed cavaties, and of practically no market value.

Upon investigation it was found that the rust-resistant plants traced back to an accidental selection made some nine years before by J. P. Pollock. In selecting muskmelons for seed attention should be paid to quality as well as rust-resistant. A schedule is given suggesting points which should be observed in melon seed selection. Muskmelons, which, from their outside marking appear satisfactory, should be cut open and examined in regard to size of seed cavity, character of flesh, etc. Observation at the station has shown that a close netted melon does not lose weight by evaporation as rapidly as one not so closely netted.

ANGLE-WORMS IN SOIL.

In a European experiment to determine the effect of angle or earth worms on the soil, alternate layers of different kinds of soil were placed in zinc boxes with one glass side, earthworms were added, the soil kept in a proper state of moisture, and the changes which the soil underwent determined by analyses at the beginning and end of the experiments, which lasted one year. A check series of boxes was treated in the same manner except that earthworms were not added.

The results show that in the soil to which the earthworms were added the phosphoric acid soluble in 10 per cent hydrochloric acid increased in all cases. The lime content, which at the beginning was greatest in the surface soil, was found at the end of the experiments to gradually increase from the surface toward the subsoil. The nitrogen was more uniformally distributed throughout the soil at the end of the experiment than at the beginning.

OLD GARDEN SOILS.

Chemical analysis of old truck garden soil showed it to be more than twice as rich in all the elements of plant food as the best manure, and yet when such plants as corn salad or spinich were planted on this soil only inferior crops were secured.

Analyses of the matter in the soil soluble in boiling water showed that it contained much less available plant food than the same soil earlier in the spring before cropping had begun. This, then, is considered to be the reason for the defective crops at this time—a lack of immediately available plant food due to exhaustion by two or three previous crops grown earlier in the summer. When the "dead" soil was treated with a dilute solution of carbonate of potash it was found that practically as much nitrogen and phosphoric acid was made available as was required for the production of good crops earlier in the season.

It is held, therefore, that if these "dead" soils are treated with some other agent which will liberate the potash of the soil in the form of carbonate of potash a full crop is assured.

THE PEANUT.

The peanut is so different in appearance from the bean and pea and is put to so many uses that it is seldom thought of as a legume, but a study of the growing plant immediately shows the resemblance. Here we see the same straggling, more or less trailing annual, with characteristic leaves, and the butterfly-shaped blossom, whose ovary develops into a seed pod. The manner of growth from this point is very peculiar; as the flower withers the stalk or spike of the ovary rapidly lengthens and pushes into the group, so that the pod is matured beneath the surface, but if the spike is prevented from doing this it soon withers. Other names for this plant are the earthnut, groundnut, ground pea, goober, and pindar. Where the peanut originally grew is uncertain. It is now widely distributed in tropical and subtropical countries, Africa and our own Southern States producing most of the crop, though the acreage in California is yearly increasing.

Some Experiments in the Propagation of Rhubarb Plants

Patient Work by J. B. Wagner of Pasadena Which is Bringing Out a Fine Product

In an article in the issue of April 20th, in which we referred to the money making possibilities of Crimson Winter rhubarb, we referred to Mr. J. B. Wagner and his patient investigations at his experimental farm at Pasadena. At this place he has over twenty varieties of rhubarb which he has secured from Eastern and Australian gardeners, many of them of indifferent value for marketing purposes, but used by him in his work of hybridizing, to secure, if possible, something that is even better than the Crimson Winter rhubarb, which has been so popular for the last few years.

As mentioned in the former article, Mr. Wagner has already secured some plants from this crossing which have given exceedingly large stalks, making a very fine flavor and well colored sauce. However, tireless, investigations go on, hoping to find something still better.

On visiting Mr. Wagner's grounds we were surprised to see so many small tents scattered about the field—on inquiry we found each tent covered an individual plant of rhubarb having special merit—this is done to keep from mixing the pollen—or to protect such as have been hand pollenized by him. Fortunately for Mr. Wagner he is so situated financially that he can devote as much time and money to his chosen vocation as he chooses and work under the most favorable conditions. He surely has our best wishes for success in his chosen enterprise.

These plants which have been successfully tested at Mr. Wagner's grounds are not offered for sale as yet, nor will they be, until proved thoroughly satisfactory. So far as selling the plants is concerned, Mr. Wagner has confined himself entirely to the original Burbank Crimson Winter. He says that this is so successful as a money maker that even the most cold-blooded must enthuse over its merits, and in this statement he is backed by the fact that all of the rhubarb medals won at the Portland Exposition were to the credit of Crimson Winter. Mr. Wagner, himself, having to his credit a portion of the awards.

Among the enthusiastic growers of Southern California, we may mention Mr. W. A. Lee, of Covina, also Mr. W. H. Purdy of Whittier. Mr. Purdy has dubbed this remarkable plant the "California's mortgage lifter," and it is made so by the fact that very ordinary care, and a very small number of irrigations, will accomplish wonders in a financial way. Mr. Purdy has picked from 2000 plants over 400 pounds at the first picking. He has one plant which on November 27th showed fifty stalks from twelve to twenty inches long, from a plant which had been planted in the July preceding.

The market price, which we believe we have touched upon before, sometimes runs as high as 12 cents per pound, wholesale. At present it is commanding not much more than one-third of that price, but even at that 4 cents per pound, Mr. Wagner picked last week from one row 350 feet long, $21.50 worth of fine large stalks, and this is the off season for Crimson Winter besides.

Regarding the picking we asked Mr. Wagner as to whether there was a certain cut or any particular care required, and he said not more than any ordinary laborer would exercise if careful. The only point being to give a slight twist downward and to one side, pulling gently so as not to pull out the crown stalk which may be just started.

We are glad to know of Mr. Wagner's success in producing and growing this money maker and wish for him success in his propagation experiments and that if possible he may win out with a stronger grower and a bigger money maker than is the Crimson Winter. If he does he certainly will be worthy of the highest commendation by all growers who will be benefited by his experiments.

In reply to a query regarding the origin and introduction of Crimson Winter rhubarb, Mr. Burbank says it originated somewhere in the Southern Hemisphere. He does not know just where or how, probably Australia. It is very little known there today as frequently orders come from there for it. This rhubarb was first introduced here by Burbank about 1899, at the time he did not think much of it as the stalks were short and small, so he began improving it by ordering great numbers of seedling and selecting the best. After a couple of years selection he had it much improved and then offered it for sale, hence as it is now known in California, it may be said to practically have been originated by Burbank. Like all rhubarbs, it has a tendency to vary in most characteristics, but strange to say it holds rigidly to the habit of winter growth and exceeding hardiness and vigor when once established It may also be said if used for propagating purposes and taken from plants far removed from the the original Burbank strain they are apt to prove very unsatisfactory, hence parties intending to plant will do well to secure plants, if possible, from parties such as Mr. Wagner, who offers plants only from stock originally secured from Burbank.

Business Training for Farmers.—The time has gone by when a farmer can succeed without business education. It is a recognized fact that one of the greatest needs of the present day is a knowledge of business methods.

Farming is a trade in the sense that it must be learned like any other trade, and has its mechanical side. It is a profession, and demands the high class education, scientific knowledge and technical skill required by all other professions.

But farming is also a business, and the farmer should be a business man. He should know how to write business letters, how to keep books, how to handle commercial paper, and how to render statements of his assets and liabilities at least once each year. More than this, he should be trained to buy and sell; he should keep thoroughly informed regarding the markets and should study business methods. Such information means money in the farmer's hands; it means greater respect for the people with whom he does business; it means increased pleasure and profit in all the relations of life.

To acquire this training and special knowledge takes time, and will mean some expediture of money and effort; but it pays. The hours a farmer spends studying his business, keeping his books, checking his crops and in caluculatiig the profit or loss resulting from each field, tree, fowl and animal on his farm—such hours devoted to thinking, planning and learning—are not wasted. They will prove the most profitable hours of the whole day.

The farmers of the present must be business and professional men first, and tradesmen and laborers afterward. The manual labor of the farm occupies a large place in the estimation of some people; but up-to-date money-makers give it a secondary position. The work of the brain is supremely more important than the work of the hands.

The modern farmer reads the papers, not only one, but two or three; he takes a magazine, he buys books, he studies bulletins and agricultural reports; he takes time to think, he attends conventions, keeps himself broad and polished by traveling a little each year; in short, he is a man with a purpose in life, and is anxious to make the most of himself and of his opportunities.

* * *

Long Labor Hours.—The problem of supplying the ranches of California with hired help is one which is worrying the owners just now as the busy haying season is about on. Discussing the scarcity of hired help with a farmer recently, he expressed the opinion that one reason why help is so hard to get and keep are the long hours required. From 6 o'clock in the morning to 6 o'clock in the evening, with only an hour at noon, is a long stretch for heavy farm work.

A good many farmers are being converted to the idea that 10 hours a day are long enough for good and successful work. They find that it is better for their horses and hired man to work rather more vigorously during a short period than to take it slower through a larger number of hours. Much time is wasted on most farms in so-called necessary rest of teams. If the hours of labor were shortened a greater amount of work could be done and the man and animals be in better shape at the end of the day.

When a man, whether he be a hired laborer or a member of the family, knows that at a certain hour his work will end he has a greater incentive to put his best energies into his work. Some of the most successful farmers have held to the 10-hour rule with most satisfactory results.

Ten hours a day is about all a farm team can stand, and if our horse tire in that time the man is certain to tire. Our fathers and forefathers toiled from sunrise to long after sunset, but they were necessitated so to do, for the reason that they were not supplied with improved machinery nor appliances to expedite work as are the men on the farm today. The Cultivator believes it would be a financial benefit to every farmer is he would adopt the 10 hours a day rule. He could save teams and he would save himself, his help and his wife tedious hours at the end of the day.

* * *

International Agricultural Clearing House.—David Lubin of Sacramento has just returned from a tour of observation and exploitation throughout Europe, with a view of establishing an international agricultural clearing-house, and he states that such an idea is well conceived and practical as proved by the fact that most of the civilized countries of the world have signified their approval and their adhesion. Mr. Lubin is to be congratulated upon hs success, says the Union, and the Cultivator might add, so is California to be congratulated, for if Mr. Lubin succeeds he is the promotor of the greatest agricultural proposition of the age.

The project, in its main features, says the Union, seems to aid at the creation of an international information bureau which will concern itself with produce and prices. By forecasting the extent and the success of the various crops, and by the general diffusion of such knowledge it will have a steadyng effect upon prices, and consequently a beneficial effect upon wages. It will eliminate upon the one hand the professional manipulator whose profits depend upon the greatest ignorance of the greatest number, and upon the other hand it will tend to remove the uncertainty as to the crops that compels the manufacturer to provide a margin for his own protection, and a margin that has usually to be furnished from the wages of the laborer. Such particulars can always be collected by the various nations within their own territories and for their own use, but now for the first time we have any attempt at an international arrangement by which the knowledge of one may be placed at the service of all through a central institute of agriculture whose reports will be unbiased and as accurate as human skill can make them.

* * *

Reciprocity Needed—Adoplh Weiler, a land-owner and stock feeder of Dunbar, Neb., returning from a visit to Germany, tells the Omaha Journal-Stockman that German farmers have the most compact organization of any class he has ever known. For years they have controlled legislation to such an extent that they have absolutely prevented the importation into Germany of any meat or agricultural products, and by so doing control the domestic markets. He said this practically puts a prohibitive price on meats for the poorer people, and steps are being taken now by the German government to enter into an agreement with this country whereby American meats can be shipped into that country. Of course this move is violently opposed by the agrarians, but it is supported by the consumers. Mr. Weiler thinks that to further this reciprocity idea, meat producers in this country should lend every aid at their command to assist the United States government in closing a treaty that would enable dealers to secure a foothold in Germany on a more liberal basis than any treaty heretofore presented for adoption.

* * *

Rushing San Francisco.—The nightmare of gloom has lifted from the burned city of the North and the agencies which are to create a new and grander San Francisco are pulsating with wondrous activity. So many temporary structures are being erected in the fire district that before another month shall have passed, business will resume a condition almost normal. Some of these buildings spring up in a night. They harbor all manner of tradesmen and their wares, while here and there a restaurant is conducting business on a large scale.

The work of laying tracks into the burned district for the removal of debris is proceeding so rapidly that before the end of the present week cars will be carrying out the age. A score of sites were this week and plans are be fected for new and greater b on the ashes of the old on shall not know our sister cit years from now, for like a nev eration it will have modern ty unsurpassed excellence.

* * *

The Sweet Wine Bill—The pa of the Sweet Wine Bill by Con will prove of much value to the yard growing districts of the For several years the wine have been contending for a red of the duty on brandy used to f sweet wine. This duty was 25 a gallon, but under the bill passed it is reduced to 3 cents, will affect a saving of millions ally, because it will permit at an enormous output of the vint

* * *

A Suggestion for Farmer Bo The opportunities for young m training and experience in agric grow better each year. Scarc week passes that calls are not for young men who have grow on the farm and have had some ing in the College of Agriculture, take positions of trust and profit. T whole system of agriculture in t country is being revolutionized, a the men who understand the f mental principles upon which the Agriculture is based are in co demand. A young man should well before deciding to throw aw the valuable experience he has a ulated during his life on the far enter some profession where th perience will not be of special to him. As valuable, however, a experience is, no man should att to rely upon it alone in his far operations. He should add to experience at the very least a Course in Agriculture.

* * *

University News Notes—In a dater April 24, from Berkeley, announced that the summer ses of the University of California be held from June 25 to Augu While the University suffered heavily by the loss of income pro in the San Francisco fire, the Un sity buildings and their content Berkeley suffered very little dam The University work will continu usual. Commencement exercises be held. The date of the exer and the form they will take wi announced later.

Professor Lawson, of the Dep ment of Geology, is at the head committee to investigate the ca of the earthquake. Professor C head of the Department of Mecha and Electrical Engineering, is w ing with the Citizens' Committe San Francisco, planning the re struction of the new city.

Aside from the temporary ab onment of the regular University tine, on account of members of faculty and student body being gaged in relief work, there will little permanent effect on the Uni sity other than a serious fina handicap, owing to heavy loss of come property in San Francisco.

* * *

Farmers' Clubs—The Cultivator w publish the programmes from mo to month for the Farmers' Cl throughout the State if the secreta of these clubs will forward them. T should be sent in a month in adva State simply the topics to be cussed and make the announceme brief as to time and place of hold meetings.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

John Franco of Napa is grafting 70,000 grape vines in Solano county.

The largest English walnut orchard in the world, comprising a thousand acres, belongs to California.

The Covina Orange Growers' Association has completed its shipment of navel oranges for the season.

Nearly one-third of the plum and prune trees in the United States, and more than one-third of the grape vines are grown in California.

The Santa Barbara County Walnut Growers' Association has elected its officers for the ensuing year and is planning for the marketing of the coming crop.

The Hanford Sentinel says the fruit crop, which will soon be ready to be taken care of, is going to exhaust the labor market; more fruit being ready to gather than there will be pickers for.

The Citrograph reports that the Italian Vinyard Co., of Cucamonga, has let a contract for another big winery. The prospect for a large grape crop is very flattering at this time.

The Visalia Courier reports that the secretary of the Visalia Board of Trade has received a cluster of dewberries ripe and plump as if they had been fully grown about the middle of June.

The cherry crop, which did not promise abundant returns in the early part of the season, now gives indications of being very heavy. The Sacramento Union says the yield will be unusually heavy unless unusual conditions of weather abound.

The Santa Clara Valley and the Hanford districts show the apricot crop to be much blackened by fungus, but the yield in these sections will be very good. Plums are very slight throughout this section; pears are also very much injured and there will be a very light crop.

The Alta Advocate has the following paragraph about fruit conditions in Sonoma County: The setting of fruit on the peach trees this season is something wonderful. Samples have been brought to this office that showed fourteen peaches on two inches of stem. The work of thinning will be no small job this season.

The Redlands Review is authority for the statement that the apricot and cherry crops in the San Bernardino mountain orchards present a very much better appearance than was supposed. The frost of last week does not appear to have been severe enough to do much damage; so with the tender vegetables. But little damage has been done to any growing crops in the mountainous district.

A correspondent from Napa County writes: Many of the prune growers of this section are complaining of the damage being done to their orchards from the caterpillar. All kinds of means are being resorted to to save the crop, and it is feared that considerable damage has already been done. In some orchards from seven to a dozen men are being employed in exterminating the pests. In others printers ink and tar is being used.

The following is quoted from the Hanford Sentinel: The Sentinel is glad to be able to state that there are many orchardists showing up who state that the peach crop is going to be better than was supposed a few weeks ago. The blighted trees have quite a good showing in the tops, while the orchards not affected by the blight are well laden. One orchardist stated that he has noticed that new growth of leaves is appearing on trees where the blight took off the first crop.

AGRICULTURE.

The hay crops in San Bernardino County is reported to be the heaviest in years.

Congress has passed the Agricultural Appropriation Bill which makes allowance for $7,481,440.

The largest beet sugar farms are in California. The product for 1904 was about 110,000,000 pounds.

Glen Bros. of Ventura County, have leased a thousand acres of land which they will plant to lima beans.

The value of farm products in California per capita is greater than that of any other state in the Union.

The asparagus yield in California this year promises to be very bountiful and this fact is disturbing the packers for they see a great waste unless cans can be secured at once.

The Imperial Standard makes a strong plea for the location of an asparagus cannery in Imperial. Asparagus grows to perfection in that locality and has proven very satisfactory to producers.

One of the largest ranchers in Riverside County makes the statement that the growers of hay and grain should sow more oats. He thinks that oat hay is much superior to barley as a feed, claiming that stock does better on this hay than on barley.

A correspondent from Verden states that the asparagus cannery in that place has been compelled to resort to glass fruit cans, owing to the fact that its ordinary tin cans were burned in the San Francisco fire, but as many housewives prefer glass cans to tin, it is thought asparagus put up in this way will be very much desired by the general trade.

The ranchers in the Coachella Valley are in a high state of anticipation for the future of the asparagus crop. They think it certain that asparagus will be the most profitable crop in that section of the country. It has been selling at 70 and 75 cents per pound in New York and this fact has created a widespread interest in the future of the asparagus business.

LIVE STOCK.

The Tehama Wool Growers' Association has cut the heaviest clipping of wool this spring received for several years and the price will range about 25 cents.

The Escondido Times reports in its last issue the shipment of eggs for the week as 5,310 dozen; butter, 1,170 pounds; cream, 2,650 pounds; chickens, 1,500 pounds. One farmer sent to market from his ranch 2,450 pounds of green beans.

Stockmen are complaining that their young hogs are dying from poison in green barley in the Imperial Valley. The hogs die in about twenty-four hours after they have eaten the feed, and the question which disturbs the stockmen is whether the poison is in the barley or in the grass.

A decided increase in the output of the Colusa Butter Company is shown in their April report—28,600 pounds of butter made during the month. This shows that a great many farmers are going into the dairy business on an extensive scale. An effort is now being made to run a ditch south of Colusa and irrigate about 2000 acres.

MISCELLANEOUS.

San Bernardino's School Census Marshal estimates the city's population at 15,000.

Escondido's railway proposition is looking extremely good, and indications are that it will be promoted with energy.

Buildings to cost $5,000 are now under contract at the Santa Monica forestry station under direction of the regents of the state university.

The Iowa legislature has made an appropriation of $15,000 a year to the State Agricultural College of that state for agricultural extension work.

Edgar F. Howe, who recently bought the Imperial Standard, announces that a daily will be issued from that office as soon as material can be secured.

An Eastern manufacturer is coming to Los Angeles to establish a malleable steel plant. A new plan has been discovered and it is claimed the process saves $4 a ton in the manufacture of steel.

An event of horticultural importance took place at Salem two weeks ago when the Oregon Nursery Company planted enough walnuts grown on grafted trees to ensure the raising of 125,000 trees.—Agriculturist.

The Rural Press comes to our table this week as showy in brains and courage as ever. San Francisco may burn down, but the Rural Press will keep right on giving its readers the same profitable instruction it has always given.

The United States Smelting, Refining and Mining Company at Kennet, Cal., which is said to be returning the United States Company between $130,000 and $150,000 net per month, is planning to nearly double its present capacity.

The Government of the United States has made a requisition to ship to San Francisco 930,000 rations of bread, 800,000 of sugar, 600,000 of coffee, 1,400,000 of potatoes, and 500,000 of beans, and this amount will last only about ten days.

Senator Rowell of Fresno thinks there is no hurry about an extra ses-session of the legislature. In reply to Senator Ralston's telegram asking him his views, he wired: "Keep your shirt on. Time enough for extra session after sober second thoughts."

Some time ago the Board of Trade of Pottowattomie County, Iowa, offered a bounty of 8 cents a head for gophers and as a result one day 490 pairs were presented for bounty, and it is said the average rate per day is nearly as high, which shows that farmer's sons are making good money catching the pestiferous little creatures.

The choice of Dr. James Withycombe as the Republican nominee for governor at the recent primary election in Oregon is distinctly a victory for the farmers. Dr. Withycombe became known to the people through work directly relating to agriculture. He stood out as a candidate representing agriculture to a degree which rarely happens.—Oregon Agriculturalist.

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

ANCONA EGGS (FROM PERPETUAL EGG Machines), imported and domestic matings, $2, $3.50 and $5.00. L. L. Viereck, Pres. Ancona Club, Albany, Oregon.

WANTED—WILD TURKEYS EGGS AT $100 00 per setting. Address only The Grace Glory Grounds, Brawley, Calififornia. Wilds of wildTurkeys (acclimated).

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

FOR SALE—30 HORSE POWER OTTO Gas Engine. Run one season, practically new. Also one 30 horse power White Middleton. Both engines guaranteed in best condition. F. H. Osler, Pomona, Cal.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

THE MILKMAN.

The problem of selling milk from the dairy with a view of making it a profitable business and at the same time making the endeavor financially profitable proposition is one which the milkman finds it difficult to solve. The good value of milk is easily destroyed by contamination. Milkers, as a rule, are an ignorant and dirty class. The prices usually paid for milkers will not secure the employment of high class labor in this field. The actual work of a milker by reason of the unusual hours at which milking has to be done as well as the strength required, commands a physical endurance which is difficult to find in persons of old age or those who have led sedentary lives. Hence, we find that poultry raising, truck gardening and other callings are resorted to by the dairyman to help out the expense of living. It is safe to predict that the present sanitary regulations will not be relaxed but we have every reason to believe the Health Department of our State and counties will be more insistent in encouraging sanitary conditions Therefore it is reasonable to expect that the price of milk will increase rather than decrease. Many of the small dairies operated by the owner and his family would not pay if the proprietor employed help and were the family to hire out to work the members thereof would be better off financially.

The recognition that steam is the only perfect cleanser of milk utensils and that a sanitary dairy must have a boiler, eats into the small dairyman's profits. The price of milk has not advanced to cover costs of aerators, engines, boilers, separators and white duck suits for the milkers, so at present the issue has been forced back to the cow and we are all scrambling to force her to greater production and are culling out all animals not reaching a high standard of production.

If the price of milk is forced upward probably other foods would be substituted in a measure for it. Take the parallel case of meat. The prices soared up a couple of years ago, the men growled but the women cut down the amount of meat used substituting other food stuffs—the American meat breakfast gave way to the French coffee and rolls for the first meal. When the Beef Trust found decreased consumption had used up the profits of the advanced prices, the prices returned to nominal, but the increased consumption did not follow, for the women found that more fruits, vegetables and cereals not only gave more variety, but also gave the family better health. Again, "The hand that rocked the cradle rules the world."

* * *

A sanitary dairy must have steam—a boiler is as necessary to make the milk perfect as the cows are to produce it. The coming of steam brings the dairyman into line for the milking machine. The wages now paid to several can then be paid to one man and he can be selected from the cleanly skilled class. His position will be more like the buttermakers, for he will care for his milking machine—running it and then care for the aerated cooling and bottling of the milk—while the cow feeders, grooms and stable cleaners will be different men.

The demand for a practical milking machine is real, and if those now being tested prove valuable, enough of them will be sold to make it profitable at once. So heart broken dairymen be patient, for the many troubles we are now enjoying seem to be nearing an end.

The relief will be great to the consuming people for the contamination of milk by hand milking is unavoidable, and with ordinary milkers it seems impossible to make clean in their work with constant supervision. Every dairy owner has at times to put up with their annoyances for if he pushes the milkers too much they leave and the cows are unmilked—so for policy sake he must endure, when he is burning to kick out the whole crew. But let us be a little charitable for we have more to thank the environments of our childhood for our own training than any merit within ourselves.

• • •

The Homes of the Milkers—The more the home life of the families from which the milkers come is observed, the less can we blame them, for raised in unsanitary homes, they look back to "the day mother died" as the best of all. Poor old woman, deep was her grievance. She tested the temperature of the cream and milk with her bacteria-laden fingers. How little elderly women, even educated ones, realize the new science of germ diseases. I saw the following the other day. In a home of some pretentious on a beautifully spread table an elderly relative of the hostess deliberately took her clean napkin, moistened it at her mouth with saliva and wiped from the spout and side of the cream pitcher the cream the maid had carelessly spilled on it in filling. After publicly doing this, the old lady politely handed it to a guest at her side to have the first pouring out. The elders action was unconscious of any impropriety or that there could be any objections to this way of removing a few little cream drops that were out of place. There rose in my mind the story of the Boston school teacher that boarded around. She lived on soft boiled eggs and baked potatoes, thankful that the Good Lord had put "coats" on these, for man's protection against the cook's lack of precautions for these wore coats.

* * *

The Family Milk.—The stables must be clean and free from odors and if only one or two cows are kept the milk is safe from contamniation if bottled. The milk can be aerated by pouring from the bucket or pail, through a wire strainer, fastened on an iron trepod three feet above the pans. When first pouring it through use a double piece of cheese cloth to strain through, then repour the milk through the wire strainer into the pans, leaving off the cloth. A large sized dishpan with a small outlet soldered at the side is convenient. Close this; pipe with a rubber cock; after the milk has been cured, then fill as many jars as needed for family use, putting on the regular paper caps and stand in refrigerator where milk has been used without being aerated the improvement is noticed, all cowy taste has gone and the milk has a delicate flavor and aroma like nectar.

The milk intended to raise cream for butter is put into shallow pans and set and skimmed as usual. When there is only a cow or two, if the milk set for butter is not skimmed until it is thick and slightly turned it is less wasteful. The cream intended for the table can be screened by having a small pail at the barn and milking the stripping into it directly from the cow. This will give a sweet cream about 14 per cent. butter fat, that is about the average in use on farmers' tables.

Another dainty is Devonshire cream eaten with bread and maple syrup or strawberry jam or on fresh fruit. It is excellent. The making of this dainty dish will test the condition under which the milk is kept. The new milk is strained in pans about four quarts in each and put into a room where the temperature is about 60 degrees for twenty-four hours. The pan is then set on wooden slats to prevent burning in a pan of boiling water, it is placed on the stove, and in about thirty minutes the outside water will reach 180 degrees but this can be told by the cream crinkling; as soon as it does that remove the pan carefully to a cool place and let stand for twenty-four hours, then take off the cream and cut in slices and serve. If there is any left over, it makes a good salad cut into blocks on lettuce with mayonaise, or it can be sliced thin and put in layers with cottage cheese in the butter moulds. Take the three inch tin cheese moulds; put on a plate; press in cottage cheese, well seasoned and moistened with sweet cream; put in a layer of the Devonshire cream, then a layer of cheese until the mould is full; turn a saucer over the top and put on ice. Eat as cheese or slice on lettuce on a bed of orange or apples with mayonaise. For a fancy salad, if the cottage cheese is colored with spinach juice, it will come out beautiful marbled and can be used to decorate a tomato salad.

REGISTRATION AND BREEDING

Why register stock? To the progressive breeder of any sort of live stock, registration of pedigrees is such a matter of course that this question is likely to provoke a smile. In view of the fact that there are seventy associations in the United States formed mainly for the purpose of keeping accurate records of pedigree—fourteen for cattle, seventeen for horses, twenty-two for sheep and seventeen for hogs—surely the benefits of and necessity for registration are pretty generally understood. Yet it is not so easy to answer the above question offhand.

That the market value of an animal is usually enhanced by the fact of its registration, as registration offers a reasonable guarantee of purity of blood, is but one of the least important reasons that may be given; and the registration fee is but a very small proportion of the value of a blooded animal. It may also be pointed out that an unregistered herd is neces-

sarily an obscure herd, as the animals composing it are debarred from entry in the show-ring or the breed contest as pure-bred animals, no matter with what care the purity of their blood may have been guarded. But there are other reasons than these.

Different types of horned cattle have been known for at least 4,000 years, and at the present time there are over one hundred known breeds or varieties, and the characteristics which differentiate one breed from another have been produced by the intervention of man in their propagation, usually by breeders with definite ends in view.

Registration is the recording of breeding or pedigree, and without a permanent and public record of ancestors breeding is necessarily more or less indiscriminate, the breeder working in the dark, and is therefore unlikely to bring about any improvement in the breed. Without registration there can be no secure scientific basis for breeding intelligently, as there can be no tracing of blood lines or examination of the records of ancestors. Indeed, no breed could for very long be maintained true to type without registration.

Of course, an individual could keep all the records of his own herd, but the life-time of the individual is all too short to work out the problems of nicking, crossing, etc., that face the ambitious breeder, to say nothing of the fact that many men are already in mid-life before they take up the work at all.

Clearly then, breeding must be largely a work in which one lays the foundation and another builds thereon. The progressive breeder works not only for himself, but for posterity also; so it is all-important that the results of his work be made matters of public record. Present-day breeders are building on foundations laid by far-seeing and public-spirited men long since gathered to their fathers. They have provided us with a basis to work on, as we in turn must provide a basis for those who follow us, if mankind is to continue to progress in this line or in any other.

Such a demonstration of dairy cows as that given at the Louisiana Purchase Exposition could have little or no value unless accurate records of breeding had been kept in the past and will be kept in the future, indeed, such a demonstration could never have been made at all. Without the Stoke Pogis's, St. Lamberts, Tormentors, etc., no Brown Bessies, Merry Maidens or Loretta D.'s would have been possible. All honor to those enlightened men who established our Jersey Herd Register and our other herd books, and put on record therein the foundation stock!

But, as already suggested, the work of the man who breeds and registers too is not altogether altruistic. There are substantial personal rewards for him at hand, in the lines of both profit and honor. His work, too, is broadening with the years. Records of breeding looking to preserve purity of blood merely, no longer suffice. A step forward has been taken, and records of performance, independently authenticated, and of individual excellence, are now demanded as bases for such future breeding as will be effectual in raising the standard of dairy breeds. In consequence, the breed associations have been establishing Registers of Merit and Advance Registers. For it is getting to be recognized generally that pedigree alone is without much significance unless the performance of the ancestry can be given also.

The work of the breeder, besides offering inducements as a profitable pursuit, is now so important to the welfare of the community, and its results are likely to be so permanent in value, that it is capable of worthily exciting the ambition of all who are attracted towards agricultural pursuits, whether as professionals or amateurs, and it is one of the most useful, most ancient and most honorable of human occupations.

TREATMENT OF LOUSY LIVE STOCK.

Farm stock that become badly infested with lice during the winter months do not thrive as they should, and in the spring may show marked unthriftiness. This is especially true when stock are not well cared for and in young animals.

The sucking lice are more harmful that the biting varieties, as the former have mouth parts adapted to penetrating the skin and sucking the blood of the host. However, the symptoms may be as marked in sheep and other animals that are badly infested with biting lice. In such cases the wool or coat becomes matted and detached, and the skin irritated and inflamed as a result of the animal rubbing, biting and scratching the parts.

Good care during the winter will prevent the lice from doing a great deal of harm, and the simpler remedies, such as mercurial and sulphur ointment rubbed back of the horns or ears and along the mane and back, and insect powder dusted into the coat, may help in destroying them. A thorough treatment of the herd with dips or washes cannot be practiced during the winter months, unless the treated animals are prevented from catching cold. A favorable time to use this line of treatment is in the spring. A one or two per cent water solution of a tar disinfectant should be used. A convenient way to apply the remedy in the larger animals is with a spray pump, and in sheep and hogs by dipping. Whatever method is used, the coat and skin must be thoroughly wet with the solution. Proper care should be taken in mixing the remedy, as there is danger of making it too strong and irritating the skin.

After treating the herd, the stables, sheds, or sleeping quarters should be sprayed with about a two per cent. water solution of the disinfectant, or whitewash may be used instead. This is necessary in order to prevent re-infecting the herd from the surroundings. If there is much litter around the yards and it cannot be gotten rid of, it is advisable to move the herd to other yards. Tar disinfectants in one or two per cent. solutions do not destroy the eggs or nits, hence it is necessary to treat the animals again in ten days or two weeks.

Stockmen sometimes ask if the feeding of sulphur to lousy animals will not drive away or destroy the lice. The feeding of small doses of sulphur will do no harm, neither will it help in getting rid of the lice, and it cannot be considered a remedy for this class of disorders when used in this way. Sulphur is effective, however, when used externally, and the addition of four ounces to every gallon of the tar disinfectant solution used greatly increase the effectiveness of the remedy. —Richard A. Craig, veterinarian Purdue Experimental Station.

The salty taste of butter is always more pronounced in the summer than in the winter. This is no doubt due to the fact that in summer the butter, being much softer, takes up and incorporates the salt more readily than in the winter, when it is harder.

The only way to succeed in dairying is to keep up with the times. Falling behind the procession is what causes so many dairy farmers to end each year in debt.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

THE HOUSE PROBLEM.

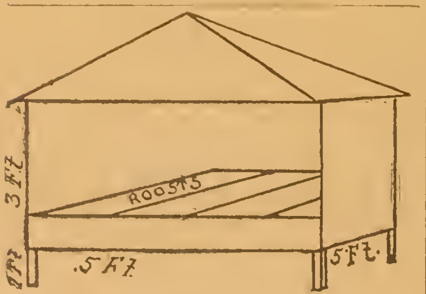
Two unlucky widowers have, since I have been writing in the Cultivator, asked my assistance in finding them partners, the necessary qualification being a love of poultry, and dozens of correspondents have requested plans for houses. The house problem I am willing to talk over (especially with L. P. L., whose letter is before me); the matrimonial ventures I must decline to promote.

In the matter of housing our Pacific Coast conditions are favorable to the building of much less costly henneries than are necessary in the East. There, about a dollar per head is the least estimated cost of the house, built to withstand the ice and snow and zero weather. Whilst in sunny California less than one-fourth of that amount will shelter birds comfortably and in neat looking houses.

All of our correspondents want inexpensive houses and most of them wish to use the colony plan of small houses for each pen or flock. This simplifies the matter, for so great is the variety of the plans of houses designed for fowls that it would be impossible to even mention them all in a short article. We will therefore confine our talk to only a few of the cheapest and most satisfactory small houses adapted to the climate of California and possibly they would be found quite satisfactory for the whole of the Pacific Coast.

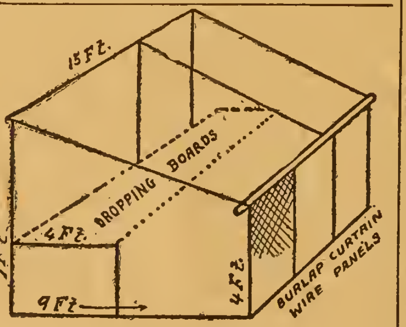
The first requisite here is plenty of fresh, pure air without any draught, in other words, perfect ventilation. The second requisite is that the house be practically vermin proof, easily sunned and easily cleaned or moved. Many of the artistic looking houses plans of which may be found in poultry books were planned by men who never owned a chicken and if built in this or any other climate would be highly unsatisfactory. The plans that I shall describe have all been used here either by myself or by successful poultry raisers and I have seen them all.

The first requisite in the house is pure air. To get this the ventilation must be at the bottom. But, says one, I thought the bad air ascends. This has been proved a mistake, the foul gases descend, the pure air and the warm air are lighter, and they rise; we want to keep them in, but if we have an opening for ventilation at the top of the house we lose the wartmh, and to make up for this loss the hens will require more food or will lay fewer eggs. The ventilation must be at the bottom or one entire side of the house may be left open.



Mushroom House

The accompanying rough little cut of a "mushroom" house will give some idea of the bottom ventilation. Houses like this were used by a friend of mine, the successful man of whom I have written. He made a light frame five feet square, this he either boarded up or covered with canvas and the roofs he made of some tin he had or of rubberoid roofing. He left a space below of ten or twelve inches all around. Where foxes or like animals may molest, a strip of wire netting around the bottom will make it safe. These mushroom houses were tipped over every day to be sunned or cleaned. I improved upon this plan by making a door of the whole of one side for I wanted to be able to handle my fowls at night without tipping the whole house over. Perches should be placed about twelve inches above the open space and in the case of heavy breeds, a run board or small ladder should be placed for them conveniently to reach the perches when going to roost. The advantages of such a house are lightness, it can be easily moved and free circulation of air without draughts on the fowls. The "mushroom" houses can be covered with matched lumber, shakes, canvas, burlap, rubberoid, or even common domestic muslin. These houses can be all painted with crude petroleum thinned with distillate oil or coal oil and colored with Venetian red. In the "mushroom" house the droppings of the fowls fall on the ground and the effluvia from them is carried away by the air passing over them. There is no bad smell in these houses.



Open Front House

The second cut is of the open front house. This is admirably adapted to the California climate and is now meeting with favor even in the rigorous climate of the East where poultry raisers begin to realize the value of fresh air without draughts, as a necessity if you want vigorous hens. In the colder climates these houses are made much deeper, that is to say, about fourteen feet from the open front to the back, instead of nine feet, as are mine. I have been using these myself for over a year, although keeping only a few hens and white Holland turkeys for my own use, so I can speak confidently of their good qualities. When I was in San Jacinto, I found that Mr. Hoffman, whose Buff Wyandottes were a picture of health, vigor and beauty is using similarly constructed houses, only his are rubberoid and mine are matched lumber. In his the roof is first covered with two inch chicken wire to support the rubberoid. At the bottom and next to the ground it is boarded up for about two feet all the way round, this is to keep in the straw, for all the floor space of the house is used as a scratching pen. The sides and back above these boards are made of panels of rubberoid nailed on light frames. These panels are taken down on all fine days to sun and air the

St. Louis, Mo.

house. The panels are kept in place by large wooden buttons. The front is entirely open or only closed with chicken wire except when it rains, then a burlap curtain is let down. The dropping boards are placed at the back about two feet from the ground; they are four feet wide and the perches are six inches above them. This is fifteen feet by nine feet, it is seven feet high at the back and four feet at the open front. This is a double house divided in the middle by chicken wire, each side will hold about a dozen hens very comfortably.

Another and very substantial house can be made of two piano boxes. The simplest way to make such a house is as follows: Removing the backs of the piano cases, use one-half of one back for additional floor, placing the cases back to back on light sills about thirty inches apart. The other half will make a door for one end. The other back furnishes the lumber needed for the gap between the cases on the roof and other side. Cover the roof with rubberoid roofing paper, and you have a comfortable house at small cost. In this climate the front of the piano box house should be either hinged so it can be kept open all the time except when the rain may drift in or it may be entirely dispensed with and turned so that the night breeze will not blow into it, or a burlap curtain may be used to keep out the rain.

In any house in this climate, pure, fresh air with absolutely no draughts is the only way to keep the hens healthy and have them immune from roup. We know by experience how very easy it is for humon beings in this climate to get neuralgia, earache, face ache or cold from sitting in a draught, it is exactly the same with fowls; they take cold, their head swells and the poor things suffer great pain and finally succumb to roup.

* * *

EDITOR'S QUESTION BOX.

White Wash and Paint. (L.) Will you be so kind as to give me a receipt for a good cheap paint for chicken houses, and also the formula for a white wash that will not wash off. Please answer me under "L," and thanking you in advance for your reply.

Whitewash.

The Poultry Manual gives the following on whitewashes. For many years there has been going the rounds of the press of the entire country a receipt for a so-called "government whitewash." The wash compounded according to the formula given is said to be used by the United States authorities on light houses, etc. Several ingredients are used, including boiled rice, glue, etc., etc. Excellent whitewash can be made easily with only the addition of salt to the lime. Glue or paste will, in this climate, at least, cause whitewash to flake off in time.

One secret in making good whitewash is in slacking the lime with hot water, confining the steam and letting the mass cook slowly for a day or two. A week would be far better and a longer period will make a further improvement.

For several years the writer has made a whitewash which is unrivaled. It will stand the wear and tear of the elements for a long time. And one, by adopting the following formula, cannot help attaining success.

In a tight barrel put five or six gallons of boiling water, hot water in which has been dissolved four or five gallons of coarse ground salt. Into this put a large pailful of the best lime obtainable, the large lumps broken into quite small pieces. Immediately cover the barrel and place over the cover a heavy weight in order to keep it in place when the lif is slacking, for the uplifting power of the boiling mass will be surprisingly great. After a few moments uncover and stir the mixture to the bottom with a long stick and then recover and keep closed for a day or two. When fully slacked the lime should be of the consistency of cream. When applied to the henhouse it must be thinned with water to consistency of paint. If too much water is used in slacking the lime will be "drowned" and the resulting wash will be thin and watery. If not enough water is used the lime will "burn" and granulate. If properly slacked the mass will be smooth and free from lumps.

When applying the whitewash dip out a sufficient quantity into a pail and then stir in a handful of cement. This will cause the wash to firmly adhere to the surface, to which it is applied. It will be of dazzling whiteness and will "lay on" like paint.

An excellent plan when the whitewash is to be used around the hen house, chicken coops, etc., is to put in a liberal supply of carbolic acid.

This may appear to some a lengthy description of the simple process of making whitewash, but any one will find the recipe first-class. The old-time method of slacking lime with cold water and applying the weak solution is very unsatisfactory.

The best and cheapest paint that I have used is ten gallons of crude petroleum, such as is used for oiling the roads here, 50 cents worth of Venetian red and two gallons of coal oil. I mix the Venetian red with coal oil and add it to the crude oil. The paint is a rich chocolate and has lasted me six years. The petroleum I dipped up from a slump hole and cost nothing, the coal oil cost about 20 cents, and the total cost about 90 cents. I know of nothing cheaper.

* * *

Taking Cold. (An old subscriber,) Will you please tell me in this week's paper what ails my chickens? They open their mouths when they breathe and act as though their throats were closing up. There is no discharge at the eyes or nose, both seem perfectly natural. I have lost two hens in the yards and three or four of my sitting hens had it, but seem to be well now. I gave them blue stone in the water and a piece of bacon rolled in red pepper twice a day and have kept the blue stone in all water, but now my little chickens are taking it and I cannot give them the meat so well as I have near two hundred. What can I do to keep it from spreading, and what is the matter?

Answer. Your chickens and the hens also have taken cold. The colds instead of assuming a cataharral form with running at the nose, have gone into the bronical tubes or lungs and the chickens have either bronchitis or

HOW TO MAKE POULTRY PAY

There is no get rich quick scheme in poultry culture. To make money out of it we must confine ourselves to plain every-day methods, do our own work wherever we can and learn before starting that our individual intelligence must govern our action. It is not the work for the idle boys, invalids or cripples. There is no dreamland, sunny side of easy street or bouquets of roses connected with the management of a paying poultry farm and we believe that at least 95 per cent of those who embark in the business do so with the hope of making something out of it. While there are specialists, theorists and fanatics that go in the business for fun or experiment, they will not average five per cent of the total that join the ranks of poultrymen every year. The 95 per cent who are in the business for profit are desirous of learning how to make poultry pay and in this series of articles we will try to give advice that can be depended upon to give good returns on the investment and tell you what you must not do if you expect to succeed.

There are many mistaken ideas about poultry culture and we believe there has been more money wasted by over enthusiastic fanciers than in any one business we have any knowledge of. When people become interested in poultry for the first time, or, as we commonly express it, "get the hen fever," they seem to lose, for a time at least, the good common sense that has guided them in other business ventures and jump in heels over head like a boy in a swimming pool. They go in as though they imagined the business was going to the dogs in about ten days and they must get in on the ground floor while the tide is on. They live and buy everything that is offered, whether they need it or not, and swallow at a gulp every ad. for food and medicine that chances to come to their notice. From some of the purchases made by beginners one would think they were starting an apothecary shop rather than a poultry farm. This craze to give money away or waste it in foolish purchases has done more real harm to poultry culture than all else. To this craze can be sighted many of the monuments of misplaced currency (not confidence) that we are constantly confronted with in all parts of America.

The writer has visited several poultry farms where the business was supposed to be conducted on a large scale, and it was plain to see failure for the enterprise. There was no more chance for success than we could expect to find should some rank outsider purchase one of our large retail houses in the city and attempt to take general management of it without any previous experience in the business. No matter how great the income may be from any enterprise or how much one knows about getting trade and holding it unless there is some one in charge of the expenditures or leak end of the business failure will follow. A money getter and money saver are two different men entirely, and the successful men of today in every line of business are the ones who know where the shut-off valve is and know how to apply it.

The failures in the poultry business cannot in every instance be traced to boys or young men just starting in life, neither can we trace it to the spendthrift or reckless liver, as in instances to my knowledge some of the most miserly, close-fisted men one can meet have plunged recklessly in the poultry business and lost every dollar they possessed. They simply figure on the profits from ten hens kept in a backyard where their living comes entirely from the waste table scraps, and imagine that a farm covered with ten thousand hens would yield the same profit per hen. If they had reckoned the changed conditions that were necessary to accommodate this large flock of fowls, the enormous expense necessary to properly house them, the amount of range required to give them comfortable quarters with equal amount of range that had been accorded the other ten and had then figured their own ignorance in making the comparison as to care and management, they would have stopped before they spent very much money. But when they get a real bad case of "hen fever" they won't do this. They have the figures on their ten hens and they propose to show you that they are the boys who know just how to do it and your time is wasted in trying to turn them away from their pet scheme.

I remember an instance while connected with the incubator business. A man with a pipe dream and visions of wealth to come dropped in my office and ordered five 360-egg machines; he then ordered thoroughbred eggs to fill them; at the same time he placed an order for a hot water heating plant and about everything else that was listed in the catalogue. He had bought lumber and wire from another firm, and had all the goods shipped to a farm that did not as yet possess a hen house. I tried to give him some advice, but found he was as full of

LEO. W. MARDEN, Manager

theories as an egg of meat, and it was just as well to argue with a religious fanatic as to try to change his plans. He had the figures and knew it would work out all right. He said in less than six months he would show Chicago what real broilers and roasters ought to look like, in fact, he was going to make a lobster out of some one (and he did) by showing how easy it is to get rich from commercial poultry. For his wife's sake I wish he had, for she was a good woman. Well, we shipped the machines, eggs and other paraphernalia. He unloaded them from the cars and we learned afterwards there arrived at the same time the lumber and wire that he was going to use for houses, fences and the like. He got the machines set up, lighted a lamp and put the eggs in them and began building a house around them. One party who visited the plant reported that at one time he saw three machines with pieces of lumber and shingles on top of them that had fallen through from the roof of the house where the carpenters were working. Two of the pieces of boards were lying on the regulating arms so the machines could not adjust themselves. By the time the hatch was due he had partially completed a brooder house. This was built on frozen ground and built of unseasoned lumber. Down near the boiler the heat thawed the ground, so there was a semblance of warmth, but the rear of the building was as cold as an iceberg. Into this house and brooder, planned after his own ideas (the only correct principle, he said) he put his young chicks. The incubators, regardless of poor attention, had hatched fairly well and there was something like one thousand young chicks crowded in these correct system brooders. Here is where trouble began. For some reason his "correct system" didn't work well. No doubt the system was all right, but the chicks were not educated to his high ideals, and rather than learn new tricks they began to shuffle off their "mortal coils." They died in two and fours and finally in hundred lots. He tried all the feeds he had read about and added a few of his own. A young mother with a "colicky" child could not have done more, but still they died. He knew his ideas were correct, for he had figured them out on paper, and figures, you know, won't lie. (The man who first made this statement has not yet tackled the hen business on a big scale.) This went on for about a week; finally he came to the city, called me to my private office, pulled a chair close to me and said, "Brother, I need a little advice." I talked over the situation with him. Finally I sent a man out to see what could be done. He came back and I asked for his report. "Well," he says, "it is a fine plant up there; he has built three large poultry houses, used up two car loads of cedar posts and one car load of Page woven wire fence; his yards are nicely arranged and his men have painted the buildings. It's a nice plant all right, all right." "But how about the chicks?" "Oh, I used a wheelbarrow for a hearse and took the chicks out and buried them; turned out the lamps to save cost of oil." "But how about our man?" "Oh, he moved." "Where is he?" I asked. "I think he is out on the South Side taking in boarders."

This same plant slightly altered and under different management is running today and making money, but the man who owns it began in a small way, learned the leaks as he went along and can today show a bank account. He knew how to make poultry pay.—By the editor of The Inland Poultry Journal.

THE POULTRY YARD

A flock of ten hens can be comfortably kept in a yard twenty feet wide by fifty feet deep. An acre of ground will contain forty such yards, or four hundred hens. No cocks are necessary, unless the eggs are desired for incubation. To estimate $1.50 as a clear profit for each hen, is not the maximum limit, but the profit accrues according to the management given. Poultry thrive best when running at large, but this applies only to small flocks. Hens kept by the hundred become too crowded while at large, no matter how wide the range, and sickness and loss occur. Large flocks must be divided, and the size of the yard required for the flock is of but little importance compared with the management.

There is much profit to be derived from the sale of young chicks—and where one pays attention to the business—they receive the greatest care. Each brood, like the adult, is kept separate from the others in a little coop, which prevents quarreling among the hens, and enables the manager to count and know all about the chicks. This is very important, as there are many farmers who hatch scores of broods and yet cannot tell what becomes of two-thirds of them. Hawks, crows, cats, rats and other depredators take their choice and the owners are no wiser. Each setting hen should be in a coop by herself and each coop should have a lath run. —Ex.

WHAT IS A REASONABLE ESTIMATE?

Assuming, says the Produce Weekly, that San Francisco holds one-fourth of our population, that its people use two million dollars' worth of eggs during the year, and allowing for a smaller use of eggs throughout the country than in the city, probably $7,500,000 would be a reasonable valuation of the egg production of California. This is conservative figuring, and if we consider that in the County of Sonoma the shipments of eggs to this market aggregate fully $1,000,000 in value, the remaining 55 counties will produce enough to confirm this estimate. It would not be extravagant to claim ten million dollars as the value of all the eggs shipped to market and consumed on the farms and in the homes where poultry is an adjunct.

A man may owe something to himself, but the chances are he owes more to other people.

General Agriculture

THOROUGH TILLAGE.

The Colorado Experimental Station has issued a bulletin in which the methods of plowing, harrowing, subsurface packing, and summer fallowing in connection with dry farming are described; the importance of seed selection for semi-arid conditions pointed out; and directions for the culture of different crops on semi-arid lands are given. The annual rainfall in Colorado is recorded and the experience in dry farming in other States is noted.

In a limited co-operative experiment a field with a light seeding of wheat had as good a stand as a field seeded at nearly twice the rate, due to the difference in the size of the kernels. The rate of seeding different grain and forage crops in dry farming is given in a table.

Of the spring wheat varieties Kubanka durum has appeared best adapted to the dry land areas of Colorado, and among the winter wheats Turkey Red has given the most satisfactory yields. Bromus inermis has proved to be the best of drought-resistant grasses brought into the State. Agropyrum occidentale is considered one of the hardiest and best native hay grasses.

It is stated that when the straw necessary to produce a bushel of wheat is estimated at 90 pounds the water required in Colorado to produce one bushel of grain amounts to 56.25 tons. It is pointed out that more moisture is required to mature crops under semi-arid than under humid conditions. Ranking from lowest to highest in the amount of water required for maturity, the common field crops are given in the following order: Corn, potatoes, wheat, barley, field peas, oats, alfalfa, and red clover.

RECLAMATION ACT HOMESTEAD ENTRIES.

The Director of the Geological Survey recently requested an opinion from the Department of the Interior as to whether a homesteader whose entry is within the irrigable area of an irrigation project, but not subject to the restrictions, limitations, and conditions of the reclamation act, may sell a relinquishment of part of his entry.

The Assistant Attorney-General has rendered an opinion which is approved by the Secretary of the Interior, that an entryman who has not acquired title to his lands may not convey or agree to convey to a water users' association one or more legal subdivisions of his entry, to be held in trust by such association and sold for the benefit of the homesteader to persons competent to enter such lands, under the same form and in the same manner now provided for the conveyance and sale of lands in private ownership lying within the limits of an irrigable area.

The opinion recites that one of the indispensable conditions of the homestead law is that the entry must be made for the exclusive use and benefit of the applicant and not "either directly or indirectly for the use of any other person." In submitting final proof, the entryman is required to make oath that "no part of such land has been alienated, except as provided in section 2288," which provides for alienation for church and cemetery purposes. Under such prohibition, "a contract by a homesteader to convey a portion of the tract when he shall acquire title from the United States is against public policy and void."

Until the homesteader has acquired either a legal or equitable title to the land, he cannot make an agreement to convey any portion of it that will secure to another any right or interest therein. He may relinquish all or parts of it, but the relinquishment must be to the United States and the land relinquished becomes public land subject to entry by the first legal applicant. If the land relinquished is within the irrigable area of a reclamation project, it becomes subject to the provisions of the reclamation act.

UNDERGROUND COAST WATER.

"The Development of Underground Waters in the Western Coastal Plain Region of Southern California" is the title of a report prepared by Walter C. Mendenhall of the United States Geological Survey and published as Water-Supply and Irrigation Paper No. 139. This paper is similar to two published on the eastern and central portions of the coastal plain of Southern California. These papers contain a list of nearly all the wells in this section of the State, and such data as to water levels, irrigation systems, and irrigated lands as could be collected by a careful canvass. In addition each paper contains a brief discussion of the conditions affecting the underground waters in the particular section of which it treats.

The westernmost section of the coastal plain of Southern California includes the Redondo quadrangle and the south half of the Santa Monica quadrangle. The more important data in this paper is presented in the form of tables and maps; the tables giving the essential facts regarding each well examined, the maps showing graphically the irrigated areas, the altitude of the water plane, the extent and position of the past and present artesian areas, and the zones of relative purity of the ground waters.

In this area, which includes the greatest body of water bearing land, the largest artesian basin and the most extensive diversified farming district of the southern part of the State, the development of underground waters for domestic purposes and irrigation has been under way for 25 years, but has been especially marked during the last decade.

The eastern and central sections of the coastal plain, which have been discussed in Water-Supply papers Nos. 137 and 138, include the greater part of the coastal plain artesian belt and the lower courses of Los Angeles, San Gabriel and Santa Ana rivers. The western section, described in the present paper, is crossed by none of the larger streams of the valley, and includes only the northwestern narrower part of the artesian area. It therefore contains a somewhat larger proportion of dry lands than the central and eastern areas. Its drainage system generally is ill defined, the valley of Ballona Creek being the only clearly marked drainageway in it. Along the coast lies a belt of sand dunes, some of which, in the section north of San Pedro Hill, are two miles inland, although these inner dunes are now active. South of Gardena is a depressed area without a surface outlet, which has contained a lake two or three miles long during exceptionally wet years. Other smaller pits are distributed along the old sand dunes belt back of the stretch of coast extending from Playa del Rey to Redondo.

Capt. Mitchell of Santa Barbara is advertising his poultry business for sale; for further particulars write him as per his advertisement in the Cultivator.

AUCTION

40 Cows and Heifers, 1 Bull, 6 Horses

On Kent Tract, One-Fourth Mile South of
GRAHAM STATION
On Long Beach Electric Line, One Mile North of Watts. Take Long Beach car to Graham Station

AT 10 A. M., TUESDAY, MAY 15TH.

35 Head First Class Milk Cows, Jerseys, Holsteins and Durhams. Large milkers and test high. Many fresh, balance coming in soon. Young and in good condition. All good dairy and family cows.

5 Head Heifers, one and two years old.

Team Black Mares, weight 1400 lbs. each, 8 years old.

Team Bay Geldings, weight 1300 lbs. each, 8 years old.

Bay Mare, weight 1400 lbs., heavy with foal.

Bay Yearling Colt.

2 Two-Seated Spring Wagons, 1 Two-Seated Surrey, 1 New Mitchell 2¼ Wagon, 1 Set Double Driving Harness, 2 Sets Single Harness, 1 Deering Mower, Rake, 1 Road Cart, all farming utensils, etc.

On account of ranch being sub-divided I am quitting the dairy business, and will absolutely sell everything to the highest bidder without reserve.

TERMS—12 months time will be given with note and approved security. Liberal discount for cash. Free lunch at noon.

KENT BROS., Owners
RHOADES, REED & RHOADES, Aucrs.
Office, 730 South Spring St., Los Angeles

San Francisco will not be rebuilt in a day, but it will be a more beautiful city in five years than it has ever been.

SURE SEAL

Home canning of vegetables, meat and fruit made easy and certain by The Economy Jar

To give you an idea how easy it is to can fruits, soups, vegetables, meats, etc., in the Economy way—Note the wide mouth—how easy it is to put your hand in and thoroughly clean the jar. No rough seams inside or out to catch lint, chip into food or scratch you. After pouring the contents in hot and wiping rim of jar, clap on the gold-lacquered cap (acid-proof.) No screwing, twisting or prying. Just press the cap on gently. No bruises, burns, cuts or sprains when you use the Economy. Put clamp on top to hold cap in position while contents are cooling. The cooling forms a vacuum and holds cap on firmly. Jar is then absolutely airtight. Next day remove clamp, which lifts off lightly. If the food was cooked enough cap is held tight by vacuum, and contents cannot spoil, as no air can leak in. If cap loosens, contents were not cooked enough to sterilize, and can be heated again and saved. The Economy automatically informs you if contents are in proper condition to put away. When ready to use, puncture cap with can opener and pry off lightly. No sprained wrists, no unscrewing, no hands gashed by broken glass. No glass particles in food; no smelly top; contents fresh and sweet as the day you put them up. No separate rubber rings required. The Economy is the jar you will use with comfort and satisfaction year after year. There is absolutely no jar that looks like, works like, keeps like, seals like, or opens like the Economy. Using some other jar *cannot* give you any notion of what the Economy really is and what it really will do. Try the Economy for yourself. Ask your dealer for it. Send his name and we will send you, free, a booklet of recipes. Write direct to main office.

Queries and Replies

BERMUDA GRASS

I have noticed several inquiries in the Cultivator where Bermuda grass seed can be obtained. I presume these enquirers think it a desirable grass for California. For their information I will state that on the 27th of this month (April) at a meeting of the Board of Horticulture at Santa Ana it was decided to start a special campaign against Russian thistle, Johnson and Bermuda grass which are increasing rapidly in the county. The commissioners feel that the time has arrived when they must make a strenuous effort at least to retard their spread or the county will be overrun with them. I lived in Buena Park, Orange County, about 18 years, two of its citizens brought in a few roots of Bermuda grass and planted them on the banks of their reservoirs. The birds carried the seed from these small beginnings so that now it is covering the whole county and doing untold damage. The grass is of very little account as a forage grass, it gets into the alfalfa and runs it out. I had 15 acres which it spoiled. There was about one acre which was clear Bermuda grasss which when cut was worthless for hay, being like chaff or feathers, no weight to it. Adjoining the alfalfa I had an orchard, the birds carried the seed near the trees where the cultivator could not reach the Bermuda roots necessitating hoeing by hand which would have to be repeated every week. If I had to be afflicted with a square rod of Canadian thistles or Bermuda grass I would choose the thistles. Bermuda grass has damaged Orange county a great many thousand dollars. I feel it a duty to warn people against it.—A. W., Los Angeles.

SEED GROWING IN THE SANTA CLARA VALLEY.

A writer in the San Jose Mercury says: "More than three-fifths of all the vegetable and flower seeds grown in the world are produced in Santa Clara Valley, California. The average annual crop of onion seed is 400 tons, or 800,000 pounds. Nearly 10,000 acres of land are under cultivation in that county for the growing of flower and garden seeds. The total crop amounts to something like 3,000,000 pounds annually, entailing a business of over a million dollars. There are grown regularly for commercial trade in California 411 varieties of sweet peas, 72 of lettuce, 33 of onion, 32 of radish, 25 of beans, 30 of asters, and 53 of nasturtiums, not to mention hundreds of other seeds less widely known.

In 1874 Santa Clara County's seed industry was limited to a small experimental bed. Near Gilroy there is a field of 640 acres, a mile square, containing nothing but seed onions. On the other side of the road there is a collection of sweet pea fields ranging in size from 100 to 300 acres each. Eight hundred thousand pounds of onion seed, 750,000 pounds of sweet pea seeds and ten or twenty car loads of mustard seed are some of the interesting items on the shipping list of the Santa Clara seed growers.

It was a man by the name of Haywards, from Rochester, N. Y., who was the father of seed growing in California. He experimented in 1874 in his back yard with onions and sweet peas. The result was so favorable that the following year R. W. Wilson also from Rochester, set out some 20 or 30 acres in onion, lettuce, beet and carrot. The annual output 15 years ago was about 10,000 pounds, but it has since grown to the astounding proportions already stated and the industry is now giving employment to over 1500 men.

Though much of the labor in seed-growing must be performed by skilled workmen, yet there is a vast proportion that can and is done by Chinese and Japanese labor. In the cultivation of plants; each coolie is given a number of rows. All start out at sunrise from their rookeries and work down the rows—80, 100 and at times 200 Celestials in a long line. They seem never to tire at their work, but keep steadily at it throughout the day. They carry their queer wicker bottles of gin with them to the fields.

In the seed-growing district of Santa Clara County, which extends from Palo Alto in the north to Gilroy in the south, there are to be found hundreds of acres of sweet peas. The annual output is between 350 and 400 tons. This is not all, for many more ranches are used exclusively in the growing of sweet peas for the floral markets of the Pacific Coast.

Of the many hundred varieties of flower seeds, asters pay the best. Next to sweet peas, they are the most extensively grown in the Santa Clara Valley, the average annual crop being about 50,000 pounds.

The California climate is not unlike that of Southern France and Germany, where the old world seed-growers have their grounds. In spite of the similarity, however, California seed-growers succeed in harvesting their crops from three to five months earlier than do their foreign competitors.

SAMSON ENGINES AND PUMPS

Some time ago the Cultivator referred, in an extended article, to the economical working, for farmer's purposes, of the Samson Engines, both gasoline and crude oil. This company has continued to enlarge their works since then and is today better than ever fitted for turning out power for most advantageous use on the farm, also water lifting machinery. Their favorite pump, which they are today manufacturing, is the Samson Centrifugal. The Centrifugal is regarded as the cheapest possible means of raising water where conditions are favorable. Regarding these centrifugals which have some of the latest modern improvements, the Samson people will be glad to send printed inforamtion showing the features which they contain that make them of more practicable value than other pumps. The Samson people claim these pumps will furnish more water per horse power than any other pump made.

Write direct to Samson Iron Works, Stockton, or see their representative at 233 Los Angeles St., Los Angeles, or 491 J. St., Fresno.

The engines are not only manufactured for pumping purposes but the company is putting out many engines of the marine type which have proved satisfactory. Of more interest to farmers, however, are the pumping engines, wood-sawing outfits which consist of the engine and all mounted on trucks, and also a small utility outfit for pumping or general light power about the ranch.

A FINE THERMOMETER FOR THE ASKING.

The O. J. Weber Co., is complimenting its friends and patrons by giving out a fine thermometer which will register anywhere from 70 degrees below zero to 120 above. We do not know whether California has the capacity of reaching the lower notch but sure it is that some favored localities are able to make the higher figure all right. In any case Weber has the thermometer to try it on, and creamery and dairy people will do well to happen in and get acquainted with Mr. Weber and, incidentally mention that the Cultivator says the thermometers are theirs for the asking. While there we presume everybody will take the chance of looking at Mr. Weber's stock of dairy and creamery supplies which now fill two large store rooms.

The Haynes Gasoline Engine, manufactured by Molby Haynes, 248 N. Hunter street, Stockton, Cal., which is being advertised in the Cultivator, is one of the simplest and best machines on the market. It is claimed for this machine that it does not require an experienced engineer to run it. Mr. Haynes manufactures all kinds of special machinery, installs complete irrigation plants, and his prices are as low as first class machinery can be sold. Write him for catalogue and estimates on any kind of work.

The Williams Farm Telephone and Supply Company advertising farm telephones, have issued a fine booklet giving full information as to cost of putting in rural telephones. Write them either at Cleveland, Ohio, or Oakland, California.

RENOVATING SOILS

Continued from first page.

plants become very rich in nitrogenous compounds, and when they decay in the soil they set free large amounts of nitrates for the use of any crop which may be growing at the time.

The cultivation of leguminous crops is one of the most important and economical means of maintaining a supply of nitrogenous plant food in the soil. Nitrates may, of course, be supplied in commercial fertilizers; but fertilizers containing nitrogen are very expensive, and it usually pays better to supply nitrogen by growing legumes or by the application of stable manure, which is rich in nitrogen when properly handled. In good farm practice both stable manure and leguminous crops are used as sources of nitrogen.

IT'S PENNY WISE
Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

YOU AND I.

If we could leave this world behind—
Its gains and loss, its praise and blame,
Nor seeking place, nor fearing shame,
Some fair land quite forgotten find,
We might be happy, you and I,
And let this foolish world go by.

No paradise of love and bliss,
No dreams of youth in Eden bowers,
But some dear home of quiet hours,
Where all of life we should not miss,
But find some day sweet ere we die,
And let this cruel world go by.

It will not be—we are too weak
To snatch from Time and Life one day;
But, when they both have passed away,
O Love, we will each other seek
Where none can part us, none deny
This world and all its woes gone by.
—Selected.

"The Babes in the Woods."

"I don't know, pa. I just dread to see them go away so far all alone they're nothing but just babes in the woods, and don't know a thing how to take care of themselves.

Thus, mamma, looking wistfully at Harry and me, the day after our return from our little bridal trip, and at the same time the day before our intended departure for our new home.

Papa lowered his book—papa was reading, in fact he was always reading if there was a spare moment to be had, but he always put his book aside quickly when called on—and with his forefinger for a book-mark, he tilted his head so that he could look over his glasses and after what seemed to me an age of consideration, said, "Oh, I would'nt worry, mother, I think they will manage to get along, they seem to be pretty lively 'babes.'

I just could have kissed pa for that encouraging remark, because, to tell the truth, I was quaking all through. Harry was only twenty-one and I was a year younger. I graduated at seventeen and taught school some, since, taught music a little, painted a little, and—now I know you will laugh, I had written verses a little, and this it was that had made our acquaintance, Harry's and mine, because he was a—I called it a "journalist," and thought it fine, but he always said simply, that he was a newspaper man. How we do magnify these little positions when they are new to us,. and how matter of fact they become to us later on.

I was awfully conscious, when mamma spoke, of all my lacks, and was more than a little nervous over them, but I turned off as bravely as I could by saying, "I hope we won't get lost, for it will take such a lot of leaves to cover Harry."

Mamma wiped her eyes, but she smiled as she glanced up into Harry's serious face. He, you see, is six feet tall, and I am five feet three, but mamma, chubby little mamma, is only five feet one.

"I'll hope for the best,'" mamma said, but not very hopefully it seemed to me.

Never mind about the tearful "good-bys," for I have learned, already that one should never refer to unhappy things. And I've learned, too, that it is not wise to talk of one's self, but just this once I'll have to in order to explain.

We took a flat when we got here, just the sweetest little mite of a nest, of four tiny rooms, with gas range, and steam heat, just as nice as could be.

While we were settling, we took our meals at a restaurant. We finished everything up late on Saturday, and then Harry said we had better go out and market, he thought for Sunday. So we went. He told me that his land lady bought her groceries at a department store, and away we went. It was such fun going.

"Now, let's see, what do we have to have, dear?" he asked.

That puzzled me a little, but I tried hard to think. "Let's see, you like olives, let's get them," I said.

We priced a big, lovely looking bottle. I had never thought that olives had a price before. I said I guessed I didn't want any, come to think. You see, I had a somewhat exaggerated idea of our poverty, and was determined to "live inside our income."

"We want flour," I announced, for I remembered the home flour barrel. We bought a big sack—and they told us it would be delivered the first of next week.

"We must have some meat," Harry announced next.

We had grown cautious by this time, so in the next market department we meekly asked the price of steak. "Twenty-two cents for that little bit?" I gasped, "why that—that—come on over here and let's look at fish."

Great big damp looking fish, and they would not deliver one before next week. But at the far end I spied some dear little dried businesses, they lay right near the "bloaters," and if they had a name I have forgotten it, but they were marked "3 cents each."

"Let's get some" I whispered, and I bravely ordered three.

We got them, all rolled up, and I took them, but—now we were almost famished, and I aver that those almost salty, brown things smelled delicious, but what would my gloves be like—and I looked at Harry and Harry looked at me.

"Here," he said, and taking them, slipped the package into his overcoat pocket. (Let me finish the story, it took a week of airing and quantities of benzine and cologne water to make that coat endurable.)

Over among the canned goods Harry saw something marked "corned beef" and bought a whole can. "I like corned beef and cabbage," he whispered, for we were both getting a little shy of airing our ignorance in outspoken words. Then we wandered till we found a cabbage and bought that.

A few other purchases and we started for home. At the corner I saw a fruit stand. Noticed the remarkably low prices of some of the fruit and suggested we get a little.

A whole dozen bananas for ten cents and great, fat, luscious looking purple plums at ten cents a dozen. We got a dozen each.

A step further on we encountered a newsboy, and Harry invested in an evening paper at one penny.

My shopping bag was full, so were our arms, and Harry's pockets and the bag of fruit was sorely in the way of his reading that paper.

The paper bag began to split, one delicious plum peeped out and I caught it, oh, but it was good. "Look out for that bag," I cried, and Harry deep in the latest news, gave a little jerk to take extra care of the bag when—pop—rip—and down went every plum and about half of the bananas.

He was a little dago, that first newsboy, but oh, how he multiplied. And he was of all nations before a wink of time, dodging, darting, skurrying as though he expected a blow at every turn. "Why, yes, pick them up, little shavers," Harry said, and they lit all about us like a flock of famished sparrows.

"And, oh, dearie, you did not get a taste of one," I wailed, as Harry clutched the last of the torn bag and we rushed for a car.

For the first Sunday breakfast we had delicious coffee—I knew how to make that—and out somewhere, Harry had found a loaf of bread and some rolls, and with these we had—fish. I cooked two. I have since thought that such fish ought to be soaked over night. We ate only one between us, and we were over an hour at breakfast. I never saw so many bones. Harry said he never did, before.

For dinner I put the cabbage in a kettle, I was sorry but I had to cut it some, for the kettle was small and the cabbage was not, then Harry twisted the little strip of tin off the can, and we dropped the corned beef in.

I don't know what ailed that corned beef, it did not stay in a nice big piece as mama's always did, it all boiled to pieces.

Harry said the kind they had at the boarding house never acted that way. I had to strain it out, and we ate it with a spoon. We could not eat it any other way.

I fairly wailed, but Harry said "Never mind, never mind, little one, the dinner is fine, though I know you would not fish for a compliment, not when you consider the price of—."

I could not let him have it all his way, so I chipped in with "Three cents apiece, and one is enough for a dinner for two."

"I'll call it quits, if you won't mention the banana sack," he said hurriedly.

Then after a moment of thought, "The little dagoes are always there under the elevated, and I think they will hope every time I heave in sight, that another overloaded paper bag may pop and discharge its insides."

"Harry," I said, "let's go some day and see the Newsboys' Home."

"Agreed," he said, and before I write you again we will have made the visit, and I will talk to you of something more interesting than ourselves."

"You mortified me to death," complained Mrs. Richley.

"How?" demanded her sick husband.

"Why did you tell that new doctor you were in the habit of eating corned beef and cabbage? We never have such common food as that."

"Well, I want him to fix his charges on a corned beef and cabbage basis."—Catholic Standard and Times.

Santa Fe

COLONIST RATES
TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago .... $33.00 Kansas City & Leavenworth $25.00
St. Louis .... 30.00 St. Joseph & Atchison 25.00
Galveston .... 26.45 Council Bluffs & Omaha 25.00
Dallas, Houston and Fort Worth 25.00
Nearly all points in Kansas, Oklahoma and Indian Territory ... 25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

HOUSE CLEANING HELPS

Most women dread house cleaning, but if it is properly planned and managed it is not a very difficult or disagreeable task, and when it is done, and we are rid of the dirt and dust that accumulate during the winter, we feel that the compensation is great enough to amply repay for the work. Many little things may be done before the regular work of house cleaning begins that will help along wonderfully. If new carpets are purchased for any of the rooms, they can be cut and bound and the widths sewed together, worn cane chair bottoms may be replaced by new ones, upholstered furniture recovered and lace curtains laundered. But do not become so enthusiastic over it that you will continue the work before the weather is warm enough. It is seldom safe to take down the heating stoves until the first of May when there are children in the family, for the damp, chilly spring weather often causes severe attacks of croup and pneumonia.

Get everything ready before you begin. There should be plenty of clean cloths for washing windows and woodwork, scouring soap, borax, tack hammer and puller, carpet sweeper, brushes of various kinds, mops, etc. Provide an extra supply of eatables that are good for cold lunches, or nice warmed over, such as baked beans and brown bread, roast chicken, boiled ham, rolls, fruit cake, cookies, doughnuts, and other things that the family like. With this help the meals may be quickly and easily prepared. Disturb only one room at a time, for while this may take a little longer, the comfort of the family should be considered, and there is little pleasure to them in having every room in the house in confusion and disorder. The attic and closets may be cleaned first, sorting the winter clothes and blankets, and putting the good ones away for the summer, with plenty of camphor gum or moth balls to keep them from the ravages of the moths. Wash the floors and clean the walls of the closets before anything is put back. Sweep the carpets thoroughly before taking them up, hang them on a strong line, and beat well, then remove the paper under the carpet, sprinkle the floor liberally with damp earth and the sweeping can be done without raising a cloud of dust.—Homestead.

PREVENTION OF MOTHS IN FURS AND WOOLENS.

The moth insect begins to fly freely about the house as soon as warm weather begins, usually the latter part of March for Rochester, N. Y. After this date it is not safe to have woolen clothing or furs hanging about where the moths can get at them. The moth fly lays its eggs in the furs or woolen garments, which hatch into little maggots which feed upon the wool or fur, or the hide itself, thus ruining it in a short time.

Remedy: Take ordinary tarred paper fresh from the roll and cut it in such shape that it will cover the under part and upper part of the garment when properly folded into a box. Place the fur or the woolen garment inside this fold of tarred paper then place in a tight paper box with a tight fitting cover. Or better, place it in a tightly sewed bag and tie the open end of the bag so tight that no insect can enter. If a tight paper box is used after the cover is put on, paper should be pasted over the crack or jamb in such a way as to make it impossible for the smallest insect to get into the box.

At the fur stores you can have your garments taken care of by paying from $1.00 to $5.00 each for the summer season, but this is expensive. At the fur stores they examine the garments each month and if they see the slightest indication of moths working they apply suitable remedies, whipping the garments lightly and exposing them to the sunshine for a brief time only.

Garments worn once in two to four weeks are seldom attacked by moths for some reason. If you have valuable furs to take care of it is best to examine them at least once a month. Dyed furs like sealskins, moths do not attack. Furs of natural colors such as mink, the moths will attack freely.—Green's Friut Grower.

WASHING CURTAINS.

Muslin, lawn and dimity curtains may be washed in soap and water. The work seems to be more satisfactory when done in that way. When taken down the curtains should be thoroughly shaken and then put in cold or lukewarm water and allowed to soak for some time. They should then be put into a suds and pressed and squeezed until clean; after this they should be put into a sack, boiled, sudsed, rinsed and dipped in a slightly blued water and starched in a weak starch water. The stiffness of the starch depends largely on the character of the material. If possible use the rice starch because it is finer and does not give the papery results that either corn or wheat starch does. Hang on a line and do not let them whip, because much of the stiffness will be lost and the curtain is apt to become frayed at the corners. Real lace curtains are washed in the same way and may be pinned onto sheets on the floor or stretched on stretchers made for the purpose. Ecru may be rinsed in water which has been made brown by the addition of a little strong coffee.

PROPER FOOD AND FEEDING

The amount of advice we have had concerning what to eat and what not to eat, would fill a book. If we eat bolted flour we may expect dyspepsia; if we eat meal look out for lithemia; in pork trichiniasis may be in hiding, and in richest milk the feverish bacilli is doubtless sporting.

And there is much in what we eat, much that concerns our health and strength, but there is much in the way we eat it. It is well to look out for germs, but the most virulent can not stand a bath in good, healthy gastric juice. It is necessary that germs come, one way or another, but let it be woe unto them when they strike the gastric membrane.

Children nowadays are trained to do most everything that is useless and expensive, let us train them to chew, to eat and drink slowly.

A glass of milk swallowed at a gulp is a revert to the way of the ostrich, and to invite indigestion and feed bacteria, but to sip it, slowly and leisurely is to make the warm, rich blood and the strong, throbbing heart.

Slow eaters are small eaters, because hunger is appeasd physiologically through the nervous system. Lots of people never eat, properly speaking, they simply fill up. The delicate nerves of the stomach, which would tell us of hunger appeased, are overwhelmed and stunned by the deluge of drink and the rain of half-masticated food. So they lie silent, and the nerves of ordinary sensation give the signal when we begin to crowd our diaphragm up about the collar bone, and we stop, not because we have enough, but because we are loaded and another mouthful might explode us.

It has been shown experimentally that it is very hard to infect a healthy animal by way of the alimentary tract, though it be fed upon the most virulent of the pathogenic germs.

It is next to impossible to avoid drinking at some time or other the typhoid bacilli, but we can do much towards improving the condition of the digestive organs.

How many of us take a glass of water in one stream, and yet even a horse takes time to drink.

Proper eating and drinking will go far towards rendering harmless many of the bacteria that threaten our life on every side.

There is something in what we eat and drink, but there is a great deal in the way we eat and drink.—Health.

Hints for the Cook

SHIRRED EGGS.

Butter your shirring cups and place one tablespoon of bread crumbs in the bottom of each; break in an egg, season well with pepper, salt and celery salt, stand the cups in a baking pan half filled with hot water, and place in the oven for about four minutes, or until the whites are of a creamy consistency. Serve in the cups with a piece of butter and a tiny sprig of parsley added to each egg.

To a large cup of canned tomato add a bay leaf, a small slice of onion, a leaf or two of parsley, salt to taste, and one teaspoon of lemon juice. Cover and simmer for ten minutes, then strain it; return to the fire and thicken with butter and flour rubbed smooth; salt and pepper may be added to taste. Arrange slices of hot buttered toast upon a platter, and pour around them the tomato sauce. The dish may be garnished with slices of hard boiled eggs and parsley.

* * *

EGGS WITH MUSHROOMS.

Drain the contents of a can of mushrooms and cut in halves. Saute in hot butter from ten to twelve minutes; drain free from the butter and place in a shallow baking dish, seasoning with cayenne pepper, salt and a little parsley. Carefully break as many eggs as will cover the top, season with salt and pepper and cover with a thin layer of bread crumbs. Pour over this the butter drained from the mushrooms and bake about ten minutes.

WINDOW CLEANER

Editor Cultivator:—Please give me the name of some good article to clean windows other than soap or sapolio. C. C., Glendale.

You will find a preparation in the drug stores called Bon Ami that is good. So is a tablespoonful of ammonia in four quarts of water.

Adrift on times' relentless tide,
As waves that follow that waves,
God grant we leave upon the shore,
Some waif of good it lacked before.

Some seed, or flower or plant of worth
Some added beauty to the earth,
Some larger hope, some thought to
to make,
The sad world happier for its sake.
—John GreenleafWhittier.

Mrs. Suburb—You don't seem to have many visitors, Mrs. Meadow?

Mrs. Meadow—No; you see I don't keep a girl, and when my relatives come I expect them to help me with the housework.—New Yory Weekly.

SALT LAKE ROUTE

EXCURSION RATES TO EASTERN CITIES.

The Usual low round trip rates to the east will be available this season from California and Nevada stations of the Salt Lake Route on account of various conventions as follows:

New Haven, Ct.—Knights of Columbus—Sell May 24, 25, 26—Return limit August 31. Rates will be announced later.

Denver. Colo.,—B. P. O. Elks—Sell July 17, 18, 19—Return limit Sept. 30. Rate $55.

Minneapolis, Minn.,—G. A. R.—Sell August 7, 8, and 9.—Return limit Oct. 31. Rate $70.

Milwaukee, Wis.—Order of Eagles—Sell Aug. 7, 8, 9,—Return limit Oct. 31. Rate $74.50.

Also sell July 2 and 3—Return limit 90 days Sell August 7, 8, 9, and Sept. , 9 and 10—Return limit Oct. 31.

Chicago, Ill.,—72,50—St. Louis Missouri, $67.50.

St. Paul, Minn. $70,00—Minneapolis, Minn. $70.00.

Kansas City, Mo.,—$60.00—Omaha, Nebraska, $60.00.

Council Bluffs, Iowa, St. Joseph, Mo. $60.

Tickets will be sold going via Salt Lake Route and connections and returing via entirely different route, if desired. For full particulars as to stop off privileges, etc., application should be made to Salt Lake Route Agents.

The excellent train service and equipment of the Salt Lake Route and great variety of routes offered affords opportunity for an enjoyable trip. Inquiries from prospective travelers will receive prompt attention from Agents or T. C. Peck, A. G. P. A., Los Angeles.

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil, this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

SIEVERT OIL BURNER CO. 1005 N. Alameda St. Los Angeles, Cal.

EDITOR'S QUESTION BOX

Continued from Page 447

congestion of the lungs. The bacon and pepper was the best thing you could have given the older hens, honey is usually my remedy for bronchitis, but I see that you want something that you can put into the water for the whole little flock. The aconite, bryonia and spongia comp. tablets, which you can get at any drug store, are the best thing I know of. The strength is 2X. (2X means 1-100 of a grain drug strength each tablet.) The dose is for each fowl one tablet two or three times a day. For flock treatment use twelve tablets in a pint of drinking water.

The most necessary thing is to find out how or why they are taking cold. Bronchitis is caused by crowding in the house at night, becoming over heated and taking cold on coming into the cool morning air, by being housed in too close or warm a building, by currents of cold air, by irritating particles of dust or lime. Find out the cause and remedy it.

Give light and nourishing diet, such as bread and milk, or rice boiled in milk with a tablespoon of ground cinnamon to the pint, keep the chicks free from lice and mites.

* * *

Stone Jar for Eggs. (J. M. W., Santa Paula.) Please answer through the columns of the Cultivator. I have a stone jar formerly used for pickling pork. It became so badly cracked that it leaked, but since I have had it wired so it is water tight. Would the crack taint it for using for a receptacle for eggs in water glass solution? If so would a coat of asphaltam varnish remedy the evil, and if not, is there anything that would?

Answer. If your stone jar does not leak it will keep the eggs well, but if it leaks the solution will leak out and the eggs will not keep. There would be no use in varnishing it, the soda would eat through the varnish.

* * *

Turkeys. (D. B. B., Campbell.) You would do me a favor if you would answer these questions through the Cultivator:

1. Is there a book or pamphlet on turkey raising in California?
2. Could turkeys be raised now and be old enough to use for breeding next season?
3. At about what age do the young turkey hens begin to lay?
4. If allowed free range how can one keep track of the eggs?

I have absorbed some points on turkeys through your department and any other hints would be appreciated.

I am one of your family of readers and was recently inspired to get an incubator of eggs and have them hatched for me. The first thing I thought of after the recent earthquake and I knew my relatives were safe was that in all probabilities those precious eggs were ruined. However, they were not injured in the least, for I have received word that they are hatching well. In a poultry supply store yesterday everyone reported that eggs were hatching as though nothing had happened to the earth's underpinnings.

Let me thank you in advance for your answers to my questions.

Answer. 1. There is no book specially written for California conditions on turkeys. You had better get "Turkeys," by the Reliable Publishing Co., of Quincy, Ill., price 50 cents. It contains articles on turkey raising from some of the best breeders in America.

2. The best turkeys are raised from two-year-old hens mated to yearling Toms, but a good deal depends also upon the breed and also upon how they grow and develop. White Holland turkeys develop and mature earlier than the Bronze. I have two White Holland hens I would like to sell as I have moved to a town lot.

3. At about ten months, but it depends upon the time of year when they are hatched, but they lay earlier here than in the East.

4. By patiently following them. For this reason I like the White Holland much better than I do the Bronze; they do not wander and are so tame they never give me any trouble. I know just about when they will lay and I fix a comfortable box or two or a barrel, and they keep to the same nest year after year.

I am much interested in what you tell me about the earthquake in regard to hatches, and rejoice with you that they were not injured by the shaking they got.

The Petaluma Incubator Co., recently closed a contract with Danger's Poultry Farm for fourteen incubators of the large 504 size; also for fifteen of the large sized brooders with capacity for 400 chicks each. Apparently the poultry people at Petaluma still believe in a big future for the poultry business and also believe in the merits of the Petaluma Incubator.

There are three essentials in the successful handling of young geese and these three should begin with large capitals. Keep them dry, warm and free from lice. Dampness and cold causes much of the mortality that takes place annually among goslings, and lice is responsible for the balance.

CAN YOU ANSWER THESE QUESTIONS?

Where did alfalfa come from? What soil is best suited to alfalfa? What are the advantages of growing it? How is it best harvested, cured and fed? What kind of grain should be fed with Alfalfa? How does it enrich the soil? How should alfalfa be sown? What is the best method of selecting seed corn? How should it be stored? How can you improve the stand and increase the production of corn per acre? What is the best method of testing seed corn? What is a germination box? How is corn best prepared for the planter? What is necessary to get rid of the barren stalks? What are the best methods of cultivating corn? How can the wheat yield per acre be increased? What constitutes a good seed bed? Should clover be plowed under for wheat? Is corn stubble a good place for sowing wheat? How should wheat be sown in order to produce the best results? How should wheat be fertilized? Why does your soil run down? What are the leading elements of fertility? How can you secure them and keep them in the soil? How much fertility does each crop take from the soil? What is the actual value of farm manure? How should it be applied to produce best results? Will grain crops make good hay? What is the best method of seeding for hay? Is the modern gasoline engine a good power for the farm? What is the best sized gasoline engine to buy? What is a four cylinder engine? What does it cost to operate a gasoline engine? Is ensilage the best and cheapest feed for dairy cows? What is summer soiling? What are the correct proportions of lean and fat producing materials in a dairy ration? How much milk and how much butter should a good cow produce? What kind of separator should the cow owner buy? What is skim milk worth as food for stock? How much wheat should an acre produce? Is wheat good in the farm rotation? Does any crop leave a poison in the soil? Can the wheat yield be increased by seed selection and breeding?

Every one of these questions and a thousand others of interest and value to every farmer are answered in "Farm Science." It is a splendid volume of 128 pages, profusely and beautifully illustrated and containing eight chapters specially prepared by the highest authorities on the several subjects. "Alfilfa Culture in America," by Jos. E. Wing, Expert Agriculturist of Mechanicsburg, O. "Modern Corn Culture," by Prof. P. G. Holden, Iowa Agricultural College, Ames, Iowa. "Best Method in Seeding," by Waldo F. Brown, Farm Specialist of Oxford, O. "Increased Fertility," by Prof. Cyril G. Hopkins, Illinois College of Agriculture, Urbana, Ill. "Profitable Hay Making," by Prof. Thomas Shaw, late of Minnesota Experiment Station, St. Anthony Park, Minn. "Power on the Farm," by Prof. Fred R. Crane, Illinoise College of Agriculture, Urbana, Ill. "Up-To-Date Dairying," by Prof. Clinton D. Smith, Director of Michigan Experiment-Station, Agri-Grain Growing," by Willett Hayes, Assistant Secretary of Agriculture, United States, Washington, D. C. Every author is a master in his line and every subject is treated exhaustively in all its ramifications. The whole composes the most valuable and authorative work ever issued along these lines. The copy before us has so impressed its worth upon us that we urge every farmer reader of our paper to procure a copy at once. A book of such value cannot be secured at any price. However, any reader of this paper will receive a copy by enclosing 3 two-cent stamps and addressing "Farm Science," International Harvester Company of America, Chicago, Ill.

Kindly say to them that you saw this article in our paper.

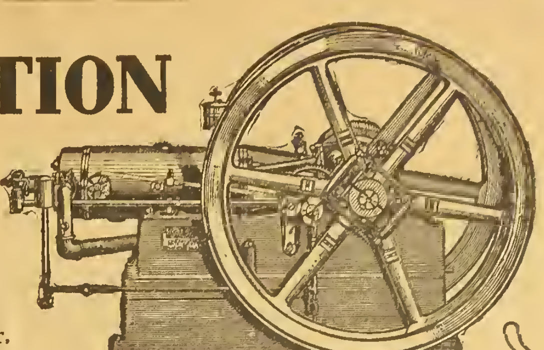
In another column appears the advertisement of the Economy Jar. Turn to that page and read the ad through again. The manufacturers of the Economy Jar are anxious to have the housewives of America appreciate how much their jar contributes to the health and pleasure of the household and the certainty and satisfaction of good home cooking.

Notwithstanding the fact that the agency of the Williams Telephone & Supply Co. in San Francisco was burned out with all others in the recent fire, they have already established new quarters in Oakland, as will be seen from their ad. in another column, and are ready to attend to business from that point as usual and invite your inquiries and correspondence.

E. M. Burnell is advertising eggs for sale from his Columbian Wyandotte pens. A fine variety and pure bred birds. See his card on poultry page.

Don't depend on the prayers of the man who lets his chickens roost in an uncomfortable house.

There are many theories about feeding fowls, but the man who gives plenty of a large variety of feeds will be pretty sure to come out ahead.



FOR
IRRIGATION
By
PUMPING

For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.

They are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.

Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

WESTERN GENERAL AGENCIES: Denver, Col., Helena, Mont., Portland, Ore., Spokane, Wash., Salt Lake City, Utah, San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY OF AMERICA, CHICAGO, ILL.
(INCORPORATED.)

A little six-year-old friend of mine came to me and threw herself into my arms, sobbing as if her heart would break, says Harper's Weekly.

"God doesn't love me any more," she wailed. "God doesn't love me."

"God doesnt love you! Why, dear, God loves every one," I assured her.

"Oh, no, he doesn't love me. I know he doesn't. I tried him with a daisy."

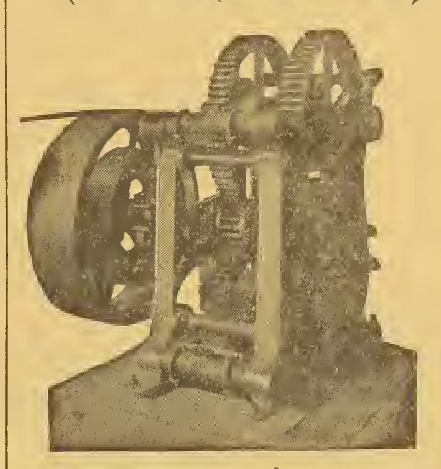
ORPHANS RECEIVED

South Pasadena, April 23, 1906.

The following named children have been admitted to the Boys and Girls' Aid Society of South Pasadena sinee last report:

Orphans—Charles Davis, Amer., 12 years of age, blue eyes and brown hair.

Half orphans—Albert Kujaneçk, Ger., 13 years old, grey eyes, dark brown hair. Leroy Hunter, Amer., 7 years old, brown eyes, dark brown hair. Ida Marks, Port., 10 years old, brown eyes and brown hair. Marie Marks, Port., 8 years old, brown eyes and brown hair. Bently Stinhoff, Amer., 10 years old, blue eyes, light brown hair. Walter Higgins, Amer., 12 years old, blue eyes, light brown hair. Maud Hogan, Amer., 13 years old, blue eyes, brown hair. Geo. Mazet, Mex., 10 years old, black eyes, brown hair. Leonard Kujaneck, Ger., 12 years old, grey eyes, brown hair. Walter O'Brien, 7 years old, Amer., blue eyes, brown hair. Arthur O'Brien, 9 years old, Amer., blue eyes, brown hair. Joseph Gardner, Amer., 13 years old, blue eyes, black hair. Harry Gardner, Amer., 13 years old blue eyes, black hair Joseph Marks, Port., 5 years old, grey eyes, brown hair. Guy Frits, Amer., 8 years old, brown eyes, brown hair. Velma Frits, Amer., 6 years old, blue eyes, brown hair. Eva Dutra, Amer., 9 years old, brown eyes, black hair. Orris Mills, Amer., 7 years old, brown eyes, brown hair. Lucile Mills, Amer., 6 years old, blue eyes, golden hair. Frank Escamille, Mex., 6 years old, black eyes, black hair. Hazel Evans, Amer., 11 years old, blue eyes, brown hair. Leo. Rowan, Amer., 9 years old, black eyes, brown hair. Martin Friedell, Amer., 5 years old, blue eyes, brown hair. Sarah Carrillo, Mex., 12 years old, black eyes, black hair. Felisino Carrillo, Mex., 10 years old, black eyes, black hair. Marino Carrillo, Mex., 8 years old, black eyes, black hair. Tom Carrillo, Mex., 5 years old, black eyes, black hair. Ward Clarke, Amer., 8 years old, blue eyes, brown hair. Hartley Porter, Amer., 12 years old, blue eyes, brown hair.



The Pomona Pump

The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Auita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

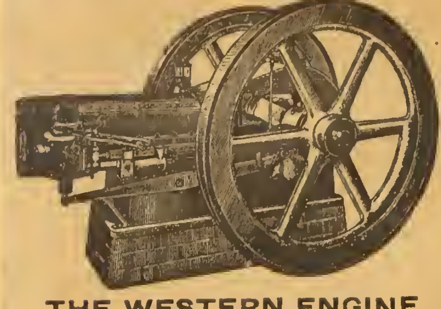
THE WESTERN GAS ENGINE



THE WESTERN ENGINE
Maximum Power at Minimum Cost

"From Factory Direct to User"

Designed and built by Western experts for Western use with Western fuel. In construction the Western embodies many original, yet practical ideas, which place it in advance of any other make on the market today. The simplest, strongest and best engine for

Irrigation, Power and Electric Plants.
Any Size from 5 to 500 H. P.

Burns cheapest fuel—gasoline, distillate or crude oil—with a saving of 20 to 40 per cent over any other style. **Send for Illustrated Catalogue** fully describing every detail of construction; tells **how** and **why** the Western excels all others; it gives the facts—the proof. Learn what Western engines are doing for others. Send your name today—ask for latest issue, A6.

U. S. Carbolic Insecticide

Trade Mark **TREE WASH** Registered

To grow fruit profitably must become a study with the grower, and to raise it successfully he must be constantly watching and guarding against the pests that attack both fruit trees and vines.

This insecticide requires no heating or boiling of water, but is used simply by diluting with cold water, assimilating perfectly, requiring no agitation, forms no sediment, no clogging of nozzles, and will not injure the hands in the least, but will, like carbolic acid, heal and cure sores if on them. It is cheaper than any other preparation or method, considering the results obtained.

The best fertilizer to the trees. The one that leaves them clean and healthy. The one that brings results and pleases. The easiest prepared for spraying.

ALFALFA STACK ON THE EMPIRE RANCH, LEMOORE, CAL. Courtesy Percy H. Clark Co.

THE ALFALFA FAMILY

Alfalfa (Medicago sativa) belongs to a large botanical genus, numbering some fifty species, which grow over central and southern Europe, and especially abundantly in the Mediterranean littoral, as also in Central and Farther Asia, and the Cape of Good Hope region. Of all these species, but four or five are of economic interest or value. Beside alfalfa itself, which is perennial, there are three annual species that have been introduced into America. These species have some local and restricted forage value, but the fact that they are not perennial plants renders them inferior to alfalfa.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the columns of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

INTESTINAL WORMS.

One of my mares is dropping out worms. They are from 5 to 10 inches long. What are they? Are they injuring horses? What is the cause? What is the remedy? Hoping to find answer in your paper.

M. N., Montalvo.

Those are intestinal worms. When they exist in great numbers they do effect the animal and sometimes cause indigestion or colic. Give the following mixture night and morning in bran mash or any damp feed. Best given on empty stomach: Sulphate iron, powdered, 6 oz.; Areca Nut, powdered, 3 ozs.; arsenis acid, ½ oz.; mix. Give dessertspoonful lever full to dose for four days. Then stop for four days. Repeat.

HEREDITARY MANGE.

Editor Cultivator:—Dear sir: I have a valuable young mare which will be three in June that has the mange or something like it. Breaks out with blotches and itches terribly, especially on her legs. I had her in pasture the two last seasons and she seemed to be as bad while on grass as on dry feed in the barn. She bites her legs until they bleed at times and flies bother her badly. I had recommended to me fish oil and carbolic acid, 1½ pint to a gallon of oil, but that seems to fail to cure it. It seems to allay the itching for a while but it comes back again. Could you give me a remedy through your paper and oblige,

M. E. F., Rialto.

This is very likely hereditary mange and is difficult to cure. You will have to treat her both internally and externally. Give internally twice a day dessertspoonful of Fowler's Solution of Arsenic. External, rub in a little of following once a day after washing the parts well with soap and water: Corrosive sublimate, 1½ ozs., alcohol, 8 ozs., shake until dissolved in quart bottle. Then fill with water and apply as directed.

SKIN ERUPTIONS.

Editor Cultivator:—I am desirous of asking what is affecting my cow. There is a condition, seemingly, under the hair, which breaks out in spots ranging from an inch in length to about the size of a dollar. These have the appearance of a cut at times; seem like a patch of small granulation; red. Give her no trouble apparently; no loss of appetite or falling off in milk. —J. B. J., San Jacinto.

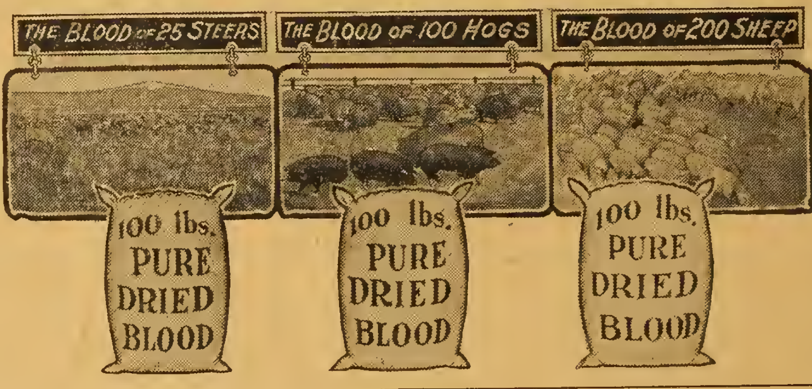
Apply a little of the following daily to the diseased parts: Eucamphol 3 ounces to pint of water.

WARTS ON COWS.

Editor Cultivator:—Please tell me how I may remove warts from a cow's eye, one about the size of a bean in the corner on the part between the ball and the lid. What injury will it do if not removed?—G. A. M., Gilroy.

The wart will do no harm, but you can cut it off with a sharp pair of scissors and apply a little borac acid on the part.

The Hearts and Blood of Half a Hundred Animals



THE BLOOD OF 25 STEERS
THE BLOOD OF 100 HOGS
THE BLOOD OF 200 SHEEP
100 lbs. PURE DRIED BLOOD
100 lbs. PURE DRIED BLOOD
100 lbs. PURE DRIED BLOOD

DID YOU KNOW?

It takes the blood of 20 steers, or the blood of 100 hogs, or of 200 sheep to make 100 pounds of pure dried Blood Meal. Therefore, pure dried Blood Meal is more valuable than people think it is. When you consider that it takes the blood from so many animals to make a single sack of dried Blood Meal, do you think you can buy pure, unadulterated Blood Meal for any such price as $3.00 per hundred pounds? Well, I guess not. If you get it for $4.25 per hundred pounds you are getting it cheap, and if you buy any grade of Blood Meal for a less price, you don't know what on earth you are getting.

THE BLOOD OF HALF HUNDRED ANIMALS

A pound of pure, dried Blood Meal is a more substantial food for flesh and egg making than any ten pounds of grain food, and yet, when you buy COULSON'S IMPROVED MASH EGG FOOD, you get a feed, a ton of which contains the cooked blood of HALF A HUNDRED ANIMALS, besides several hundred pounds of cooked Meat Meal, fresh ground Bone Meal, etc., all fine-ground into meal, and is so thoroughly mixed up by special mixing machinery with the richest grade of Middlings, Shorts, Cocoanut Meal, etc., so as to make a RICH, BALANCED RATION for making heavy egg-production.

NO WONDER THAT IT MAKES HENS LAY.

Is it any wonder that hens fed on this kind of feed will lay 200 eggs a year, or more? It's a mighty rich feed, and in order to assist the fowls to get the value from it, we mix a few ingredients with it, that will assist the digestion and assimilation of all the good things in the feed.

IGNORANT PEOPLE BUY CHEAP STUFF

Some poultrymen are using cheap Blood Meal that is adulterated with half tanbark (or other worthless material, of no use as food) which they could readily see if they only would know enough to LOOK at it.

And yet, they buy this cheap Blood Meal, and other fertilizer trash, and try to make Egg Food out of it, or mix up a feed of their own—and call themselves "SMART MEN." It's like a farmer trying to compete with a harvester, and who uses only a scythe and a rake.

When a poultryman buys COULSON'S IMPROVED MASH EGG FOOD, he gets a choice, rich feed, that contains GOOD, PURE, WHOLESOME INGREDIENTS that will do his hens good, and enable them to produce an abundance of eggs.

INTELLIGENT MEN, that's the kind that buy COULSON'S IMPROVED MASH EGG FOOD.

YOU LOSE MONEY ON UNHEALTHY HENS.

It pays to keep machinery in good order to prevent waste. It pays to keep your hens in order to prevent waste. Do you realize that a hen, whose liver and working machinery is not in healthy condition, eats food which passes out of her without being half digested, just as whole grain would come through a dull mill, without being half ground?

GOOD FEED MAKES GOOD HENS.

It is on account of this waste that so many poultrymen remain poor; they do not realize that their fowls do not get two-thirds of the value of the feed. But when the hens are fed COULSON'S IMPROVED MASH EGG FOOD, they get ingredients mixed in the feed that put the hen's working organs in good condition, so that they can assimilate and digest the good materials that are in the feed, and make two eggs where they only made one before.

If anybody tells you that COULSON'S IMPROVED MASH EGG FOOD contains any trash, you can put it down, that either they have been MISINFORMED, or else, they are WILLFUL MISREPRESENTATIVES of the truth.

$300.00 FOR FEED—$900.00 WORTH OF EGGS.

During the past year (1905) Mr. J. Christensen, of San Luis Obispo, Cal., fed his flock of 300 laying hens on COULSON'S MASH EGG FOOD every day, and the total cost of all the feed used, during the year, was $300. He sold, during the year, $900.00 worth of eggs, making $600.00 profit.

5 WEEKS OLD CHICKS—3½ CENTS EACH.

Mr. Christensen hatched out 312 chicks, and fed them entirely on COULSON'S GROWING CHICK FOOD, dampened with a little milk.

He purchased 5 sacks of it, for which he paid $11.75. When the chicks were 5 weeks of age, he had 310 good, strong, healthy chicks; only two having died, and out of the 5 sacks of feed, he still had a bucketful left. So the cost of feeding them COULSON'S GROWING CHICK FOOD, up to 5 weeks of age, was about 3½ cents per chick, and raised 310 out of 312.

4 TO 4½ CENTS A MONTH TO FEED A HEN.

It costs 4½ cents a month to feed a hen COULSON'S IMPROVED MASH EGG FOOD, and it also costs 4½ cents a month to feed the cheaper feeds, as you have to feed so much more of them. By feeding COULSON'S IMPROVED MASH EGG FOOD, you will get the most eggs, not only now, but next July, and next October; and your hens produce for you, at least, $1.00 per year more profit than what they have ever done before.

Transportation of Fruit in Refrigeration

By C. Harold Powell, Presented Before the American Society of Refrigerating Engineers

I am glad of the opportunity of bringing before a body of Refrigerating Engineers some of the problems that confront the fruit industry in the extension of the American fruit trade. I refer especially to the difficulties that arise in shipping perishable fruits under refrigeraton.

The United States stands first among the nations as a fruit growing country. No other country has developed the industry on the scale that our commercial orcharding has attained. The tremendous extension of the railroads since the civil war, and the American aptitude for developing new industries, has opened vast geographical areas in the United States where fruits of various kinds flourish more abundantly than other products of the soil. California has a peerless reputation throughout the world for the products of her orchards and vineyards, western Michigan for its peaches, Florida for subtropical fruits, the Carolinas for strawberry, and western New York for apple orchards. Orchards are being planted throughout the United States more rapidly than ever before, and new horticultural regions are springing up in the East and the West as the facilities of transportation are extended, and as irrigation and other improvements in modern agriculture make fruit growing possible where land was formerly unproductive.

* * *

The Demand for Fruit Increasing.—There are abundant reasons to suppose that the present period is not more than the infant stage of the American fruit industry. The demand for fruit is increasing with leaps and bounds throughout the civilized world. It is passing from a luxury to a staple food. In the United Kingdom the consumption of foreign apples has trebled in the last six years. The demand for various fruits has grown not less rapidly in our domestic markets. Our urban population is increasing more rapidly than ever, factories are building more numerously than farms, thereby increasing the demand for fruits as never before. We have no statistics on the subject, but our impression is that the increased demand for fruit is more than keeping pace with the increased production from the areas that are constantly coming into fruitfulness.

* * *

The Export Trade.—There is an unlimited opportunity for the development of the export trade where the use of fruit has had a phenomenal increase in the last thirty years. Great Britain paid over twenty-five million dollars in 1904 for her imported fruits, of which about five million dollars worth or less than 14 per cent. came from the United States. Her import fruit bill amounts to more than the total import and export fruit trade of the United States. Our foreign apple trade is the only fruit developed to any extent, the United Kingdom securing from the United States over 50 per cent. of the imports, which amounted to nearly ten million dollars in 1904. We sent only about seventy thousand dollars worth of the ten million dolars worth of oranges imported by the United Kingdom in 1904. The orange is the largest single import item in the fruit bill of the United Kingdom. The trade is monopolized by Spain which furnished from 85 to 90 per cent. of the supplies. American oranges are luxuries in European markets. The California navel is superior in size and appearance to the best European oranges, and are prized highly by those Europeans who are fortunate enough to know them. Here is a golden opportunity for the California navel and Valencia, two varieties of superb shipping quality. Of nearly nineteen million dollars worth of miscellaneous fruits, such as the peach, pear, plum, cherry, and others, exclusive of the banana, imported by the United Kingdom, we send not one-quarter million dollars worth, yet our peach, pear, plum and some other fruits can be exported under favorable conditions of transportation. The opportunities for trade on the continent of Europe are not less attractive, and the time is coming when there will be a big demand for American fruit in the markets that are tributary to the Pacific.

* * *

Over-Production the Result of Poor Distribution.—The future development of the American fruit industry depends on the ability of the producer to lay down his crops quickly and in sound conditions in distant markets both domestic and foreign. Efficient transportation is the keystone which must determine the stability of the industry. So called overproduction is the result of an inadequate system of distributing a crop widely and safely. Inadequate transportation means temporary gluts followed by barren markets. Under a proper system of distribution, there is little danger of the over-production of most kinds of American fruits, if a high standing of grading and or quality is maintained.

Taken as a whole, the American fruit transportation service is the best in the world. We have the only highly developed fruit car service in existence. Fruit is distributed more widely, in quicker time, in better condition and at cheaper cost here than in any other country. The fruit crop requires special facilities for transportation. It is the most perishable commodity that the car line handles. It deteriorates quickly from over-ripeness or from decay. It must be handled carefully by the grower, it requires quick refrigeration and uniform service on the part of the car line and rapid schedules on the part of the railroads. The fruit-car service as a distinct part of transportation is hardly more than 25 years old in America. There has been a gradual improvement along all these lines since its establishment, but we have reached a time in the history of the fruit trade where considerable additional progress must be made in the methods of handling fruit for transportation if the fruit industry is to be developed to the largest extent through a wider distribution in domestic and foreign markets.

* * *

Weakness in the Methods of Fruit Handling.—One of the principal difficulties that the fruit grower or shipper has to face in extending the fruit trade is the limitation in the distribution of fruit on account of the ripening and the development of decay that may occur in refrigerator cars. In ordinary practice, fruit is loaded in cars in a hot condition. It requires several days after the friut is loaded to reduce the temperature of the fruit to a degree of cold that retards the ripening and the decays. During the first few days the car, especially in the top, is warm. The ripening springs forward during that time, and, as the atmosphere is moist, the rots may begin to grow vigorously. These are fundamental difficulties in the present method of handling fruits for transportation. They have a far reaching influence on the development of the fruit trade. They limit the distribution of the perishable fruits, thereby preventing the greatest development of distant domestic and foreign markets. They also make it necessary to pick the summer fruits prematurely to protect against the ripening in transit, thereby placing enormous quantities of insipid, flavorless peaches, plums and other fruits before the consumer.

* * *

How the Peach Industry is Affected—I will endeavor to make these problems clear by a few specific examples. The Georgia peach is limited to markets within three to five days from the orchards. The fruit is shipped in carriers, usually loaded in the car five tiers high. The peaches range from 75 to 95 degrees Fahr. when placed in the car. Under the best carline service, the temperature of the fruit in the bottom of the car may drop to 40 to 50 degrees in two to five days. The temperature of the top tiers of fruit may be 10 to 15 degrees higher. On arrival at destination, especially with the early varieties, or, in all varieties in wet seasons, the bottom tiers of peaches may be sound, while the top tiers may have developed from 5 to 30 per cent of soft and decayed fruit. The bottom tiers could be shipped several days longer, but the distribution of the crop is limited by the probable condition of the fruit in the top of the car. We know that the Georgia peach can be stored safely in a temperature of 35 to 40 degrees for two weeks. We know that the Georgia peach can be shipped to the markets of the United Kingdom, if the shipping season is favorable and the conditions in transit are right. The problem, therefore, that the Georgia peach grower would like to have solved is (especially as he has twenty million trees that may bear in the next few years) and the problem is equally important in all of the peach growing sections in the south—how can the handling of the fruit be modified so as to insure its safe arrival in more distant domestic and foreign markets. On the solution of this problem will depend in a large measure the permanent stability of the enormous capital invested in Georgia peach lands.

Let us examine the relations of the present methods of handling the California peach for transportation to the conditions of the industry. Grown in a semi-arid climate the Pacific Coast fruit is dryer that the eastern grown fruit. It has wonderful shipping qualities. The fruit is wrapped and packed in 20-pound boxes, which are stacked in the car about ten tiers high. The fruit is distributed throughout the United States and Canada, and to a limited extent, to European markets. The trip across the continent averages about 10 days, and the entire trip to the United Kingdom less than 20 days. The California shipper has the same trouble as the Georgia shipper with the top tiers of packages. These tiers are often marked and sold separately. The fruit in them arrives in New York in all stages of maturity from full ripe to moldy, while the peaches in the bottom tiers may be hard and sound.

The California peach is frequently loaded at a temperature of 95 to 100 degrees. At the end of five to ten days the temperature of the fruit may drop to 40 to 50 degrees. On account of the smaller package, the closer packing in the car, and the wrapper on the fruit, it requires nearly twice as long to cool the fruit as it does the Georgia peach packed unwrapped in more open carriers. The California fruit, therefore, continues to ripen several days after loading, even when the bunkers of the car are filled continuously with ice. To protect against this ripening in transit the peach grower has to pick the fruit at a very immature stage of develop-

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

HARDPAN ORCHARDS.

There will be an increased activity in fruit tree planting during the next few years. Fruit growing has paid in most cases and there seems to be a bright future for it. Orchards that are planted on land that is of average quality will bring fair returns, other things being equal.

As in orange growing there will be deciduous trees planted on land that is not fit for fruit trees. The great valleys of the north have an immense area that comes under this class· Hardpan land will produce a few good crops of grain if the season happens to be favorable for that class of land. Much rain will destroy crops on such land while it will make big crops on well drained land· Seasons of light rainfall are favorable to hardpan sections as it takes little water to fill it and the hardpan strata hold the water close to the surface. This is what makes such land worthless for fruit growing. Trees may and often will do well there for a year or two,' but soon as the roots get down where they should commence to do business, water that is held by the hardpan will stagnate around them and that ends the life of the tree.

It is a common idea that pears may be grown to advantage on very wet soil and this is true to a certain extent. This fact has induced some growers to try pears on hardpan land. We do not know of a case where it has been a success but we do know where it has been a failure. Trees planted in situations where good deep soil tapers off into the harpan class will start out and keep about even for the first year. Each succeeding year will show a growing difference in the size and vigor of the trees on the different knds of soil. Nothing will make a poorer showing on this poor land than Bartlett pears. We have seen this tried to a finish·

Peaches planted on the same kind of land grew to be two years old when the root rotted off and the time and and trees were lost. This was where the hardpan was two feet from the surface and the drainage was poor. On an adjoining slope where the hard layer was under six feet of clay, peach trees produced crops of fine fruit.

* * *

OFF BLOOMS.

We recently noticed in the coast region in Orange county, peach trees that had fully leaved out over the greater part of the tree and had set a good crop of fruit over most of the tree, but a number of branches were just putting out a fine lot of bloom. These were at least a month behind time and seemed to promise a late crop of fruit. Such occurrences have been common in Southern California for a number of years and seem to be due to sudden changes in the weather. Trees thus affected always lose vitality and soon become worthless. The long branches that usually are bare of leaves during the greater part of the summer, should be cut off so that all the vigor of the tree may be thrown into the actively growing portions. These parts which are dormant require a great deal of sap and there is no return for that amount drawn from the tree.

VINEYARD QUESTIONS

Editor Cultivator:—I have a three year old vineyard of Zinfandels and being a new beginner would like to ask you some questions. How can I detect the Anaheim disease? All of my vines made a very rank growth last year and are doing well this year with the exception of a few here and there scattered through the field, which do not seem to start out at all and yet the vines look as healthy as any of the rest. I find upon digging around the roots that suckers are coming up. Do you know the cause of it?

What implement is best to use for applying sulphur to my vines to prevent mildew? I cannot find anything in the Los Angeles market. I have used a sack but do not like it. It gets wet with dew and does not work well. I tried a flour sack but it does not hold enough.

Is it just as well to throw the sulphur on the ground under the vines as it is to put it mostly on the top of the leaves in the center as I did last year?

Do you have to sulphur table grapes the same as wine grapes and when is the proper time to do it?

H. J. A., Toluca.

The sprouting of the vines from below the ground with a cessation of growth of tops is an indication of Anaheim disease. It is usually preceeded however, by indications that are quite plain, the summer before.

These are usually an abrupt change in maturity of the canes, patches of green being surrounded by ripened wood, and the leaves of black or colored grapes become bright colored prematurely, the high color being followed by drying of the leaf, first between the veins and midribs.

A good sulphuring arrangement can be cheaply made by a tinner. Make it like a big pepper box with the handle opposite the perforated end. Have the handle made like those on the cup lid of a milk can. Have one end so it may be opened to fill with sulphur. As you walk by a vine, hold it among the branches and give it a chug which will sift the stuff out. This is an easy arrangement to handle and is compact and durable.

It is a good idea to sift the sulphur on the main branches and also on the ground beneath the branches. One application after the bloom drops and again when the berries are about the size of sweet pea seed.

* * *

FERTILIZERS FOR GRAPES.

Editor Cultivator:—Will you please tell me what fertilizer to use for a vineyard in this locality and where can they be had? Also has the experiment station published a bulletin on the analysis of fertilizers?

Subscriber, Kingsburg.

No one can tell you what fertilizer to use on your vineyard unless he has experimented on the particular vineyard which you wish to fertilize. You cannot make a mistake by using stable manure, but when it comes to using commercial fertilizer, the kind and quality which it would be economical to use cannot be determined except by trial.

Bulletins on commercial fertilizers are issued at the experiment station at Berkeley at intervals. You may get them by mailing a postal card to the director.

* * *

FUNGUS ON APRICOT TREES

Editor Cultivator: Enclosed please find a few branches of my apricot trees that are affected with a kind of blight. Is it chlorosis or something else and is there a remedy for it that will cure it now? It has been getting worse each year.—H. H., Orange.

The leaves have been attacked at the time that the buds opened and have made but little growth. There is nothing that will save those leaves; but spraying with Bordeaux mixture now will help to hold it in check another season. Spraying in the winter time will help to eradicate it. One application late in the winter and a summer r spring application in case the disease begins to show up will no doubt bring the trees out all right. We cannot tell you the name of the disease, but it is evidently a fungus of some sort. Prof. R. E· Smith of Whittier can give you this information and may suggest a better method of treatment.

* * *

TARRED ROPE FOR APPLE TREES.

Editor Cultivator: I notice in the Cultivator of the 27th issue that the apple growers of Pajaro valley are using tarred ropes about their trees. I would like to know if ropes have to be tarred each season and at intervals during the season. What size ropes are used?—Subscriber, Santa Barbara.

Will some of our Pajaro valley subscribers please drop us a line and tell us about this? We know just enough about this not to be on the safe side when it comes to advising. We will appreciate the favor.

* * *

PARIS GREEN AND BUGS.

Editor Cultivator: How strong a solution of Paris green should be used on plants?

How can I exterminate snails in the garden, also a green bug that resembles lady bugs?—Mrs. L. D., Wilmington·

Paris green should be used 1 pound to 200 gallons of water. If it is mixed with about a quart of ammonia to a pound it will be rendered soluble and will be evenly distributed, will not require stirring. It will, however, be in a condition that wll allow it to be washed off with a shower of rain. The ammonia should be mixed with the Paris green before adding the water.

Mix up a paste of cornmeal and white arsenic and place it under a box in the garden. The snails will soon get the run of it and no doubt when a few get the stuff those that are left will come and eat them and thus they will pass it along. If you do not care to use arsenic, use the meal alone and when they get the run of it, go out about 10 or 11 p. m., and gather them up. Snails and slugs make good chicken feed if not mixed with arsenic.

The green bug is no doubt the diabrotica and insect powder is a good remedy for it.

* * *

FIELD MICE.

Editor Cultivator: Will you please inform me through your paper the best remedy to get rid of field mice in the celery patch as they do considerable damage every season, especially when the celery is stored away for winter in the pits.—G. M., Grand Rapids.

Cultivate owls and hawks. They will clean out the mice quicker tnd cheaper than any other agency. An occasional very light dose of cyanide in the form of a fumigation will fix the mice in the bins. It will have the disadvantage of leaving them in there dead and bad odors will remain for a while·

When a rich man does something to really benefit agriculture, let us all honor the act. Here's J. J. Hill offering $34,000 in cash prizes for best farming in the Dakotas and Minnesota! The Hill prizes are to be awarded by Orange Judd Farmer of Chicago.—Farm and Home.

Practical Farm Science

BY PROF. A. J. COOK

THE QUEEN BEE.

The successful dairyman must have good dairy stock in his herd if he would reach the top rung in the ladder of success. The farmer of the rich Illinois prairies who produces corn finds that pedigree corn for seed adds immensely to his profits. In like way, the one who is to touch the top in successful honey production must have the best bees. Every observing beekeeper is aware that some colonies of bees are far more profitable than are others. In the economy of the hive, everything hinges on the queen. She is mother to all the workers. She, not only gauges the population of the colony, but she gives character to the work of the colony in its entirety. The wise, progressive beekeeper will, therefore, look well to the quality of his queens. Every well informed beekeeper will know his best queens by actual test of honey production, and will take all pains as far as possible to secure his young queens each year from these best tested queens. The cow with a famous record is no more important in the dairy, than is the queen with a startling show of profits, in the apiary. By the exercise of judicious care, the beekeeper can be sure that all his young queens are from his best old queens and, by taking great pains, he can often be pretty sure that they are as well mated. One reason why many of our best beekeepers, who stand out so prominently in records of profit, have reached such high success, is that they are most cautious in breeding their queens. It will pay every beekeeper to secure from these old experienced apiarists, occasional queens bred from their very best. Indeed, such well known apiarists as Doolittle, Miller, Taylor, etc., are not slow to secure such additions to their breeding stock, even though they are very careful in their own breeding.

* * *

BEET CULTURE IN GERMANY

Magdeburg, only two hours from Berlin by rail, is in the center of the beet production and sugar manufacture of all Germany. Mr. Frank S. Hannah, our American consul at Magdeburg, has paid not a little attention to beet culture as practiced in that section. Mr. Ernst Grotkass is a beetgrower at Magdeburg and one of the best informed men in Germany in regard to beet growing and production. Mr. Grotkass, though a native of Germany, was for ten years a citizen of the United States, where he became naturalized. Though he is now again in his native country, he claims with pride his American citizenship. From Messrs. Hannah and Grotkass, I have been able to learn much regarding beet production, in this section, that must be of considerable interest to growers in America. There are two points that should ever be kept in view by beet growers: they should not only work for the maximum quantity of beets to the acre, but they are equally interested that their beets should give the maximum sugar content as well. From Mr. Grotkass' long residence in the United States and his later frequent visits there, his views and suggestions are peculiarly timely, and worth attentive consideration. He claims that great pains should be taken to secure the best seed. This, as all agree, is at present produced in Germany. Indeed, a large part of the seed sent to America is produced in the near vicinity of Magdeburg. Exceeding pains is taken in the breeding and growing of this seed. Mr. Grotkass is insistent that American growers should not trust to others to secure their seed but should see to it themselves, and should combine that they might get the best at the cheapest rate. He says at the present time, many are paying at least twice as much as they ought to for their seed. He also is very emphatic in the opinion that the American growers are using far too little seed. He says that from twenty-five to thirty-five pounds per acre is not too much, though often in America, not more than one-third of this amount is used. In Germany the grower feels that there must be no vacancies in the rows. He says the amount of vacant space that he saw in America would be looked upon here as ruinous. The land should be thoroughly plowed in autumn and must always be kept carefully cultivated and the grower should practice such rotation as would make his land in the highest degree weed free. The thorough cultivation is not only to eliminate weeds but also to keep the soil pervious to air at all times. I am told that the cultivation in Germany is far in advance of that generally practiced in the United States. I judge from what I learn here that the beet fields generally are as free from weeds, in Germany, as are our best cultivated orchards in Southern California. Timely thinning is also looked after with great promptitude. Germany is also very liberal with stable manure and commercial fertilizers. America will more and more come to the same practice. So far as I can learn, green manuring is very little practiced in Germany.

It is considered by German beet growers exceedingly important that the ground be thoroughly and deeply plowed in autumn. Mr. Grotkass is surprised that this work of plowing is left till spring in many of the beet fields in America. It is to be hoped that our American beet growers will observe all these points so that they may equal the proud record of Germany the past year of twenty tons per acre with a twenty per cent of sugar content. Mr. Grotkass tells me that he believes California has superior climatic conditions for producing wonderful crops of beets with the highest percentage of sugar.

COW PEAS draw nitrogen from the air in large amounts, if sufficient POTASH and phosphoric acid are supplied to the plant.

The multitude of purposes served by the remarkable cow pea, are told in the 65-page illustrated book, "The Cow Pea," which also tells of the splendid results obtained from fertilizing cow peas with POTASH. The book is free to farmers for the asking.

SERIOUS GRAPE PEST IN THE EAST.

During the reign of George the Third it was decided to appoint a day for thanksgiving. The year had been an unpropitious one in every way; ill success had attended the British arms abroad, crops had failed at home; business was in a state of depression, and everything seemed to have gone wrong to the bow-wows. When the king was asked what there was to give thanks for, he thought a moment, and then replied, "Let us thank God that it is no worse!" When our California orchardists think only of the evils in various insect pests and fungus and other diseases which attack their trees and which require constant warfare, they are apt to think their lot a hard one, but when they look abroad and see how many ills they escape they can very readily agree with King George and return thanks that things are no worse. There are innumerable ills which the fruit growers in the East have to contend against which we in California know nothing of. Just think of the Plum Curculio in our prune orchards and our cherry orchards, of the peach yellows and rosette in our peach orchards; of the fruit flies in all of our fruits, and of a hundred and one others which we have not got, and it will appear as though we are not troubled with insect pests at all. In some sections of the East there is a curculio, one of the little snout beetles, which attacks the grapes, and the only way in which they can be saved is by tying up the bunches before the grapes are half formed in paper bags. If this is not done there will be no grapes. Just think what would happen to our raisin crop if we could not grow them without tying each bundle in a bag. Really, we have no serious pests here, and with watchfulness of our county horticultural commissioners, there is little danger of their introduction.

* * *

A CURE FOR PEAR SCAB.

Many of the pear orchards in Northern California, which have escaped the pear blight, have suffered severely from pear scab and cracking. Wm. Booth, a prominent pear grower on the Cosumnes River, in Sacramento County, has been a great sufferer from this cause and has not harvested a crop of marketable pears from his orchard in the past five years. This year, and to use his own words, he determined to cure the scab or kill the trees, and to this end while the trees were still dormant he prepared a wash on the principles of the Bordeaux, but much stronger, dissolving all the sulphate of copper (bluestone) the water would carry, practically, he states, 30 pounds to the 100 gallons of water, to this he added 20 pounds of lime. The bluestone was added to the water first and the lime slacked in the bluestone water. With this he sprayed all but twelve of his trees, leaving them as a check. The result is that every tree sprayed is loaded with perfect fruit, while the twelve left have light crops of badly scabbed fruit. Mr. Booth states that he will have a very large crop of good pears this year, the first in years, and he ascribes it to the extraordinary strength of his application.

* * *

PEACH CURL LEAF.

Peach curl leaf has appeared in some of the peach orchards and is doing much damage. Very many inquiries are made as to how to cure this disease. It may be stated that the disease may be prevented but cannot be cured. When the curl leaf shows itself on the foliage that is the end of it for that season. The damage is done and it cannot be cured. The diseased leaf will drop off and another crop will put out, at the expense of the strength of the tree, which is weakened by every drain made upon it in this way. Curl leaf is a fungoid disease; it comes from spores shed from the previous season's crop and which remain on the twigs and branches of the tree until favorable conditions cause them to germinate in the spring, when they break forth with a new crop, much to the detriment of their host plant. To check this disease it is necessary to use something which will kill these spores before they have time to germinate, and the best thing so far known is the Bordeaux mixture. This should be used full strength while the trees are dormant, and it should be seen that every part of the tree is reached. Salt, sulphur and lime has also been found excellent as a preventive.

* * *

BENEFICIAL INSECTS IN SACRAMENTO.

Owing to the wreckage of the insectary of the Horticultural Commission, caused by the earthquake in San Francisco, and the fact that the Ferry Building in which it was located, is being repaired and is practically untenantable at the present time, it has been determined to remove the insectary to Sacramento, and to breed the beneficial insects at that point. To this end a temporary structure is now being erected, which will be used until a permanent and durable building can be had. The work of caring for and distributing the parasites will be in charge of E. K. Carnes, who has had the care of them in San Francisco, and who will remove to Sacramento.

* * *

INVESTIGATING OUR METHOD

New Zealand is nothing if not up-to-date, or a little in advance of it. She has copied California methods extensively in her horticultural work, has some excellent horticultural laws, and first class agricultural department, and, horticulturally, is in the front rank. Since the introduction of the parasite for the codling moth, from which we hope so much, New Zealand has watched it very closely, as she too has the codling moth, and in order to be thoroughly and officially informed as to the probability of the success of that insect, she has sent a special agent, W. A. Boucher, the Government Pomologist, to California to investigate and report. Mr. Goucher, while here, will carry on an investigation in other lines of interest in relation to Calfornia methods in fruit growing, etc.

* * *

EFFECTIVE SPRAY FOR PEACH BLIGHT.

We have advocated early spraying with Bordeaux mixture for the peach blight, which is a fungus growth and not similar to the pear blight, and we are pleased to note the statement of a correspondent of the Madera Times giving his experience in this matter. The writer is G. L. Hawley, and he says: "The trouble has long been serious in these parts, and it is very reassuring to know that there is a remedy. We have a practical demonstration before our eyes on the Midvale Land Co.'s orchard. The north side of the road was sprayed and the south side was not. On the north side there is little or no blight and a good crop of fruit is promised, while on the south side the blight is bad, and here will be very little fruit. This shows conclusively that the spray was a success in every way."

FIGHT THE MOTH.

Codlin worms are beginning to hatch out in the packing houses in all apple growing districts, and orchardists will soon be called upon to battle valiantly against this pest, which will be attacking their trees.

A safe and positive method of conquering the codlin worm has been found in the arsenate of lead spray, and all of our fruit growers should apply the remedy according to the direction of the university specialists. In test orchards last season the remedy proved entirely satisfactory and it can be used to advantage by all orchardists.

There should be more summer spraying this year than ever before. We will have the codlin moth with us in numbers, wherever apples are grown, and it remains to be seen whether man is going to let an insect outdo him. We are liable to have a large apple crop, in nearly all sections, and we should strive to place it on the markets of the world in first-class shape. In order to do this orchardists must spray intelligently.

Weinstock, Lubin & Co., Sacramento, Cal.

With the Citrus Growers

BY J. W. MILLS

A NOVEL METHOD OF WRAPPING.

Last fall we noticed a young orange grove in Redlands that was being wrapped with sorghum stalks, the sorghum having been planted in a circle around the trees in June or July. It was allowed to remain thus until the cold weather was due when it was simply drawn close around the tops of the young trees and tied with a string. It seemed to work well as no staking was required and the trees came out in fine condition this spring. The sorghum roots no doubt make it necessary to give a little more water, but the irrigation of an orchard during the first summer is not a serious nor expensive job.

* * *

SETTING OF ORANGES.

As usual we hear complaints of oranges dropping and prospects of light crops. We would be surprised if we did not hear this. We hear it every year. Growers will complain of oranges dropping and then before picking season comes around they will have to prop the branches to keep them from breaking from the weight of the fruit. These conditions do not always prevail of course. Some growers have suffered considerably during the past year from dropping of the young oranges. It takes an experienced grower to know if too many oranges are dropping, and even he is sometimes deceived. The difficulty with estimating a crop before August is that the oranges are so small and being the same color as the leaves, only a small percentage of them can be seen unless a close inspection is made, and even then a great many are overlooked.

The drop that comes at the time of the July growth seems to be the most serious. The oranges are then about the size of half-grown walnuts and it sometimes appears as though they will all drop off. It is hard to give a plausible explanation of the cause of the dropping of young oranges. The drop that comes immediately after the blooming period seems to be natural. Should all the blooms set fruit, or even half of them, the trees could not bring the fruit half way to maturity. Writers on the subject have advanced the theory that the seedlessness of the Navel orange renders it weaker than it would be had it seeds. This theory is not backed by experience. The Mediterranean Sweet is a notoriously free bloomer and is usually a shy bearer. There has been a general budding over of Mediterranean Sweets to Navels and Valencias, not because they do not bring good prices, but because they usuallv do not bear as well as these varieties. It has been our observation that certain locations in certain sections are admirably adapted to the Mediterranean Sweet, and in such places they pay better than Navels.

It would appear that a large percentage of the blooms never were intended to produce fruit. In other words their whole office seems to be fulfilled when they produce flowers. The climatic conditions have considerable bearing, for an orchard will sometimes have a series of light crops and then a series of heavy crops. Some advance the theory that cutting the roots by plowing when the trees are in bloom or the fruit is at the "setting period" causes the drop. This is not the whole thing, as we have plowed at such times when large numbers of roots were plowed up and still the trees produced heavy crops. We have read that root pruning will encourage a good setting of fruits of certain varieties, so this objection is not founded on physological facts. It is very safe to assume that if the general vitality of the tree is kept up and uniform conditions be made to prevail the dropping of the fruit beyond a serious point will be stopped. Stimulants may bridge over the critical period but when other requirements are too far out of line these will no doubt fail. Climatic conditions no doubt play an important part, but it is hard to judge even those. On the third of April one of the severest hail storms known in Riverside pelted the orange trees for an hour. The trees were just in bloom and the outside leaves of some of the thrifty growing orchards were torn into strips. Those trees are now loaded with perfect little oranges.

LEMON TROUBLES.

Editor Cultivator:—I have five acres of ten year old lemons. Several of them have some disease which I can get no information as to the cause or cure. It is generally confined to a few limbs and in one or two cases to the entire side of the tree. The foliage is badly mottled and mostly consists of short stubby suckers, what fruit sets is pear shaped and never gets the proper size, while the balance of the tree is filled with fine fruit. I recently dug up a tree that was more affected than the others, thinking the trouble might be with the roots. The only thing I could see was a rather scanty supply of small fiberous roots. All the large ones look in good condition. Two years ago I budded two trees to naval oranges. The buds on the affected side never made much growth, look spindling and sickly, while the rest of them look fine and produced some fruit. The grove had been well watered and fertilized with both stable manure and commercial. Last spring I applied nitrate of soda on the effected side, the only result was that during the growing season the mottled appearance was not quite so pronounced. I should be pleased to receive any information as to the cause; also the cure if any is known.—Subscriber, Bloomington.

This is a condition that is becoming quite common and it is for just such complaints that the Pathological Station is to be established. We cannot tell you what to do for your trees. The laboratory for the Pathological Station is now in operation at Whittier and is in charge of Prof. Ralph E. Smith. Prof. Smith is anxious to locate all orchards or plantations of any sort which have trouble in the nature of diseases, and if you will correspond with him, he can do more for you than any person whom we know of.

Madge—It must be dreadfully hard to marry for money.

Dolly—Indeed, it is, dear. All the rich fellows seem to be snapped up.—Harper's Bazar.

FRUIT PROSPECTS.

Fruit prospects in the Sacramento and San Joaquin valleys are given a cheerful boost by Manager G. B. Katzenstein of the Earl Fruit Company in an interview last week, while admitting it was early to form anything like a correct estimate, his views would not cause a fear of light crops. Grapes ought to be a record-breaker as the vines never looked more promising. Cherries are going forward and bringing good prices. "Of course," said Mr. Kttzenstein, "there are some varieties of fruits that will be short. This is always the case. The peach crop may be light in one part of the State and heavy in another. This applies to peachs, apricots, plums, etc., but, taking the situation generally, I think growers at this time have reason to look forward to good crops and good returns."

Citrus Trees

—All the Standard Varieties—

Finest Trees, Lowest Prices

B. C. Benner Nurseries - San Dimas, Cal.

10 per cent gross on every car is being saved by growers using the new patent Cyclone Car Cooler (Famous Intermittent Vacuum Method). Address today

Chas. F. Edson. Manager Citrus Cooling Company, 950 West 20th Street, Los Angeles, Cal.

Oranges and Lemons

Plant now orange and lemon trees because it is the growing season in which to establish yonr orchard. In this connection we want to offer you the best and largest assortment of citrus trees from which to select—trees true to name, of A 1 quality, and of the best sorts. Write us your wants and we will give you prices and particulars together with our book on Citrus Culture.

San Dimas Citrus Nurseries

San Dimas, Cal.

ORANGE TREES

Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

WATER FOR SICKLY PLANTS

It has been shown by careful experiment that sickly potted plants can be greatly benefited, and somtimes entirely restored to vigor by applying warm instead of cold water. In some cases, plants which have never bloomed, or which have done so but imperfectly, after being treated with warm water, produced a most magnificent luxuriance of bloom. Water may be applied about 110 degrees F., and gradually increased each watering to a temperature of 150 degrees F.

THE BLUE PALM.

Erythea armata, the blue palm from Lower California, forms a striking contrast to the dark green of the date palm. In young plants the blue or glaucus "bloom" is very noticeable, and if growing in the full sun, and with a well drained soil, it will always maintain this pleasing shade. In its native habitat it is said to grow to forty feet but in cultivation it would certainly not attain such a height under several centuries.

ARCTOTIS

One of the most valuable introductions of late years is an annual for florists' or garden use, Arctotis grandis, and grown in California quite extensively. It hails from South Africa, where about twenty species are found, of which our subject is the showiest and most valuable for all purposes. How extensively it is grown we have not heard, but the few the writer has seen created a very favorable impression both with the florists and gardeners. Every lover of flowering annuals should give this plant a trial this spring.

OUR WILD FLOWERS.

Now is the season for locating wild flowers with a view to later work of gathering seeds, bulbs, or digging up shrubs. This is a work to which more attention should be paid in every county in California. Our natives look better, thrive better, and get along with the least care, of any vegetation ever grown; therefore, on the score of economy alone, it pays to grow them, and they really are as showy as anything the nurseryman has for sale. Plant some native plants this year. Next year you will certainly increase your collection.

A GOOD PALM.

Erythea edulis, the Guadalupe fan palm, is a much more desirable palm than Washingtonia filifera for small places. It does not shed its leaves annually as does the Washingtonia; they remain green and beautiful for years. Strictly speaking, Washingtonias, our native palms, do not shed their leaves, but they die and drop down along the trunk which give a tree 50 to 75 feet high a dead appearance except for the tuft of leaves at the top. Erythea seeds are round, fully an inch in diameter, and require 18 months' time to germinate.

SO-CALLED IVIES.

Senecio macroglossus is a vine that has been in bloom in the open the entire winter in Southern California. Its beautiful light yellow, star-shaped flowers, borne in profusion, make it very much darker in color and not so large as that of German ivy, Senecio mikanioides, but for a basket plant or covering arbors it is very much more effective because of its profuse blooming character.

THE ASPEN.

Populus tremuloides, the common aspen or popple, is the commonest of the American poplars, and it ranges from Labrador to Kentucky, New Mexico and California. It is the species which springs up in recent clearings throughout a large part of the Eastern States. In aspect it is much like the European Aspen (P. Tremula), but the leaves lack entirely the deep teeth of that species and they are green on the under side. The catkins are also smaller, and there are other botanical differences. There are no horticultural varieties of this species, but the plant is worthy attention from planters.

A FINE SHRUB.

A beautiful white flowering shrub, Acokanthera spectabilis, has proved its worth for California by its great profusion of bloom during the past season. The flowers are about the size of those of a white bouvardia, borne in umbels in the axil of every leaf. The fruits, which ripen during the winter months, are the size and color of those of the purple leaved plum, containing a milky acrid juice exceedingly unpleasant to the taste. An evergreen, it is very ornamental whether in fruit or flower. A native of South Africa, it is perfectly adapted to our dry climate, and will be in every collection of shrubs in California when its merits become known.

WINDOW BOXES

Window box, porch and veranda gardening, it would seem at present is within the threshold of a successful era in this country, and it seems strange that this effective and comparatively inexpensive method of beautifying houses, especially in cities, has not been long ago more universally adopted and advanced, considering the long standing of this art of gardening in European cities, which are annually visited by thousands of American tourists.

It may truly be said of most of our attractive cities that the creation and development of park systems all over the country has had a very far reaching and beneficial influence upon the beautifying of home grounds through the residential districts of these cities, and it is quite natural that it should be so. Indeed, it would be a strange, unresponsive, cold people that would not take the lesson so easily learned and within the reach of all; and the very fact that the lessons given have been so fruitful, bringing additional happiness and attractiveness to so many homes, should lead us on to further efforts to extend the cultivation of flowers at all seasons of the year at the homes of all.

The fact that the wind will blow the seeds of grass, of a shrub or even of a tree into the smallest crevice of a stone pavement, a stone wall or any almost inconceivable space, often too small to be noticed by the superficial eye, and that said seed will germinate, produce a plant which will live its term, should teach us that there is hardly a space or location which will refuse all conditions necessary to plant life, but that, on the contrary, with the help of painstaking care, adverse conditions can be overcome and plant life can be introduced and maintained everywhere where bareness otherwise rules supreme.

LAWN FERTILIZERS.

Since the lawn is a permanent feature, it is hardly possible to make the soil for the reception of the lawn too rich. Stable manure which has been thoroughly composted and rotted and which is as free as possible from detrimental weed seeds is undoubtedly the best material to use in producing the desired fertility of the soil. Forty to sixty loads of well-decomposed stable manure are not too much to use upon an acre of land designed for the greensward. Where such stable manure is not available the next best plan to follow is that so often sug-crops, such as vetches, Canadian peas, beans, and similar plants. The land should then receive an application of about 1000 pounds of lime to the acre, and at the time of preparing the seed bed 500 to 1000 pounds of fine-ground bone, together with 300 to 500 pounds of a high-grade fertilizer upon each acre. The fertilizer may contain 3 per cent nitrogen, 6 to 8 per cent phosphoric acid, and about 8 per cent potash.

LAWN GRASSES.

Lawns in which Bermuda grass has gained an entrance and largely crowded out blue grass present a very unsightly appearance after frosts have occurred, the bluegrass remaining bright and green while the Bermuda grass, after having been frosted, turns light brown, thus presenting a very spotted and unattractive appearance. Under these conditions the Bermuda grass becomes a weed, and when your lawn becomes thus filled you have left but the choice a lawn of "weeds," or the making of a new one; the latter you will eventually do unless you altogether abandon the idea of keeping a lawn.

HORTICULTURAL HERESY.

Some Yankee nurseryman, 'tis said,
  Claims to have scored a floral coup.
For he succesfully has "bred"
  A rose indubitably blue!
Which, like the short-lived "green carnation,"
Will cause, he hopes, a wide sensation!

But we, for our part, cannot be
  Approvers of the skill he's shown;
Confound that nurseryman! say we,
  Why can't he leave the rose alone?
Blue rose, forsooth! Why not black lily,
Or something even still more silly?

For in the end this meddling crank,
  Resolved his cleverness to show,
May outrage Nature by a prank
  Past which e'en he can't hope to go
Yes, he may stagger us, the varlet!
With a violet of vivid scarlet!

—Truth.

No, the roses soon wither'd that hung o'er the wave,
  But some blossoms were gather'd while freshly they shone,
And a dew was distill'd from their flowers that gave
  All the fragrance of summer when summer was gone.

—Thomas Moore.

SHADE TREES and EUCALYPTI

Also a fine variety of Eastern trees, such as Lindens, Maples. Horse Chestnuts, White Elms, etc.. all well established in cans. Dracenas. Palms. Roses, Ferns, etc.

In the Vegetable Garden

BY ERNEST BRAUNTON

PLANT-BEDS.

Plant-beds are very largely employed in this State for raising seedlings. A cold-frame will serve the purpose of a plant-bed for raising seedlings, and has many advantages. Seedlings, after growing to a size that are easily handled are often planted in a bed for further manuring; this is especially so when large quantities of tomato, cabbage or celery plants are wanted. The advantage of having these plants in as small a space as practicable is apparent to all. The plant-bed must be very fertile, and have plenty of water to be used in case of need. The ground should be raked carefully, the fertilizer applied, and the bed spaded or plowed, and then raked again. The bed should lie a week or ten days, to allow the fertilizer to be incorporated, when the plants may be set out. Plants should not be allowed to become checked in their growth at any time. It does plants good to be planted several times, and with some vegetables such frequent planting is profitable; but for plants to come to a standstill for want of water or fertilizer works a detriment that is strikingly noticeable in the crop. Hence in the transplantings great care should be taken as to moisture, temperature and soil, so that growth may not be checked.

DWARF LIMA BEANS.

Beans of the dwarf Lima type have attracted much attention during the past few years, but there appears to be considerable confusion as to their merits and little positive knowledge of their botanical features.

In the first place it should be said that the dwarf Lima beans constitute a comparatively new type of garden vegetables. They have all appeared in public within the last score of years, and they are apparently nearly unknown in other countries, except as introductions from North America. Seedsmen and horticulturists often remark that when any very decided variety of plants is introduced, other varieties of the same general type are likely to at once appear, and this fact will undoubtedly account for our having several apparently new varieties introduced about the same time. These have of late years been "weeded" until those now grown are all of the best, so that no serious danger results from buying any seed generally offered for sale in the bean districts of California.

MANURING AND FERTILIZING

There is no one thing upon which the success of a truck garden so much depends as upon manures. They must be applied in quantities that would appear excessive to one engaged in any other branch of agriculture. The different vegetables require plant food in varying proportions, and a fertilizer suited to one may not contain the essential ingredents (ammonia, phosphoric acid and potash) in the proper proportion for another, and it is economy to have special mixtures for the particular vegetables grown. Peas and beans, for instance, require 3 per cent of ammonia and 7 per cent each of phosphoric acid and potash. Ammonia, phosphoric acid and potash occur in different soils in varying proportions and the fertilizer formula must be so modified as to correct the excess of deficiency, as may be indicated by experience. While for general gardening purposes stable and barnyard manures have no superiors, few gardeners are so situated that they can procure it in quantities to suit their needs. Such manures should be piled in a compact mass and occasionally turned over and well mixed that slow fermentation may be kept up. Chopping down the heap vertically will reduce the manure to a better condition for use by the plant and at the same time facilitate its distribution in the field. Where land is abundant or the supply of stable manure inadequate, green manuring and commercial fertilizers must be used to make up the deficiency. With an abundance of stable manure the separate fertilizing ingredients are frequently more profitablly used with the manure than either alone, no matter how heavy the application may be. Under some circumstances and for certain crops it will be found that commercial fertilizers give better results and are more satisfactory than stable or cow manure. Until the soil has become well filled with vegetable matter there is no better or more economical way of rapidly increasing and at the same time balancing its fertility than by using crops of peas or vetches for green manuring in connection with applications of phosphoric acid and potash.

Whether fertilizing materials are applied broadcast, in the drill, or in the hill they should be well incorporated with the soil before planting by the use of the harrow, plow or hoe. Unfermented manures should not be applied immediately before planting, but either composted or spread over the ground some time before it is to be occupied by the crop, otherwise it may affect the crop disastrously.

Soils need rotation of manures as well as of crops. A plot of land that has received continuous and heavy applications of stable manure will give greatly increased yields if commercial fertilizers are given it, with or without the continuance of the stable manure. On the other hand, the addition of stable manure will also greatly increase the yield when applied after continuous use of commercial fertilizers.

EARLY CUCUMBERS.

This has become one of the leading vegetables for the winter and early spring. It stands shipping to distant markets remarkably well. In that portion of California where there are frosts the seedlings should be started in a cold-frame or in a hot-bed. This seems like very remarkable advice to those who have tried to transplant them, but it is easy enough when you know how. For every acre that is to be planted procure twelve hundred two-inch paper flower pots; the same number of four-inch, and, if very early cukes are wanted, the same number of six-inch. Use only the best seed, and plant them four in each pot. These pots should be filled to within a half inch of the top with good potting soil; it is planted six weeks earlier than the last frost usually occurs, if it is intended to use only the two smaller sized pots; but about nine weeks if the three sizes are to be used. The cost of the pots in the former case will be less than nine dollars; in the latter about twenty-five dollars. There is no doubt but that one could obtain a large discount on these pots, if a large quantity were to be bought at one time. If these pots are not sunk into the sand they will stand for two crops. During their growth the plants should be examined frequently to see that they do not become pot-bound. They should be shifted to a larger pot as soon as the soil is permeated by the roots. This may be tested by removing the soil from one of the pots which may be done easily as follows: Hold a pot upside down, press on the bottom, this will loosen the soil, the condition of the roots can now be examined without difficulty. As soon as the roots have taken up most of the space in the pot shift the plant to a larger one.

The plants should not be transferred to the field until two weeks after danger from frost; if the spring is cold and backward it is better to keep the plants under the protecting cloth. This method seems to be rather expensive, but it avoids all danger from frosts, and if the six-inch pots are used the plants will be too far advanced to be hurt by the cucumber aphis. Much useless working of land is also avoided. On the other hand it requires skill and experience to prepare the potting soil properly, also care in handling the plant bed. The amount of work will be found to be less than when they are planted directly in the ground.

GARDEN BEETS.

There are many very valuable varieties of garden beets at present. The best ones to grow will depend upon the fancy of the market as to color, size, shape, etc. The ground cannot be too rich, nor too thoroughly pulverized. The roots generally bring the best prices early in the season, and it often happens that it pays better to harvest the crop when half grown, than to wait until fully matured. Like many other vegetables, they may be had continually by sowing in succession from two to three weeks apart. Always press the soil closely to the seed when planted, or in a dry time the seed will not germinate. The ground occupied by the early crop is always used for a second one after they are marketed. The majority of gardeners sow more seed than is necessary, and then thin out, leaving the desired number of plants to mature, using those thinned out as a substitute for spinach.

THE "BOSS"
TREE PROTECTOR
Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. can be easily removed; will last for years.

The Free Seed Evil.—Though the Committee on Agricultural Appropriations reported against the continuance of free seed distribution, the House, by a vote of 153 to 82 decided to continue the evil.

Though there are many classes to be considered, the interest of the Cultivator centers, primarily, in the farmer. The farmer needs no seed favors from the government. What they need is further extension of rural delivery, and such other accomodations as will enable them to do business in an expeditious and economic manner. All an honest farmer wants is a "square deal," the right to ship his produce to market at reasonable rates, an equitable tax rate, and a few such necessary concessions from the government. He will then be prosperous enough to buy all the seeds he wishes, which would far exceed his purchases under present conditions.

Farmers when considering the situation in a sober, candid way would have no occasion to regret the discontinuance of seed for which he had little use and in which he had no choice. This "free seed graft" has always been worked to the limit and usually with unsatisfactory results so far as crops were concerned. Reports from thousands of farmers show that often the seeds would not grow and very rarely was a maximum yield obtained. A majority reported that they would much prefer to purchase what they need in the way of seeds. Furthermore this measure, like so many "free" government conditions, is generally worked as an odious political graft.

Great injustice has also been done to the seed and nursery trade by interference with an honest and progressive class of tradesmen and growers. While there should not be any friction between the trades and the Agricultural Department, the members of the seed and nursery trades owe it to themselves to have this uncalled for embargo on their industries removed or at least so modified that it will not redound to their harm. Did the measure in any way aid the Agricultural Department, not a voice would be raised against it, but this Department has to keep a corps of workers on hand to distribute these seeds, merely to help the political "pull" of some aspirant for office. The American Association of Nurserymen, and the seed trade in general, are waging an unrelenting warfare against this evil and it is earnestly to be hoped that success will crown their efforts.

* * *

The New Farm House.—The "good old fashioned farm house" has passed away and in its stead has come a modern dwelling more fitted to the needs of the present, and perhaps future generations. We look back with something akin to reverence upon the charming, restful, and altogether delightful old farm house of the simpler type; yet with all the sentiments which surrounds it no one in this progressive day would be willing to return to it. The modern house is adapted to modern needs and is much more habitable than the old style ever was or could be. Nevertheless, with the new house has come the need of more and better things for the interior, more conveniences, furniture, and utensils, while out-of-doors the gardeners art has been called into play to embellish the grounds to suit the more pretentious architecture. We often wonder whether this development of the rural home is towards the "simple life" of Wagner or the "strenuous life" of Roosevelt.

* * *

Parcels Post for the Farmer.—In spite of the strong fight put up by the opposition, the will of the majority must finally prevail in the matter of inaugurating parcels post. This measure means much to all farmers but to none is it fraught with more importance than to those in the rural and fruit growing districts of California.

Much has been said and written on the subject, with schedules and tables to show just what may be done, but to strip the matter of all technicalities, parcels post is a name given to a proposed postal provision whereby small and medium parcels of merchandise may be sent by mail at reasonable cost.

The proposed measure is fought by express companies and the merchants of the smaller towns, but will be heartily welcomed by the farmer and farmer's wife. The express companies want to monoplize the business of carrying packages of all kinds and sizes The country town merchant fears that the farmer will find it advantageous to buy his goods at the big department stores of the city and such others as make a specialty of the mail order business. These goods could be sent by parcels post and delivered by the rural mail carrier right to the farmer' door, saving himself or his good wife the necessity of a trip "to the store."

For nearly twenty years agitation on this question has been going steadily on, each year gaining in the number and enthusiasm of its advocates, until now the proposed measure seems assured of success. One after another of the farmer's organizations have taken it up until at the present time they are a unit in demanding its adoption. Nearly every country but ours has a satisfactory parcels post system of untold benefit to the small farmer, while it places life's necessities and luxuries within easier reach of all who dwell in rural districts.

* * *

Deciduous Fruit Outlook.—The outlook for the coming crop of deciduous fruit, is on the whole, a very promising one for California. Apricots seemed to have suffered severely in some sections from early frosts, especially north of the Tchachepi, less severely in Ventura county and scarcely none farther south. In the principal apricot districts, however, the crop will be a light one.

Peaches have been damaged in but few sections and in nearly all localities the crop will be heavy. In places the peach leaf curl has been very bad and one heavily planted district reports that all but the Muir are affected, the crop very short and that prices will be correspondingly high. In many other districts the caterpillars are denuding the trees of foliage and while this will have some bearing on the total, the ravages seemed confined almost to parts of two or three counties. In places the new blight has been serious.

In all parts of the State prunes seem to be a heavy crop, the great Santa Clara valley reporting that prospects are unusually fine. Reports of serious damage from caterpillars are coming in from farther north, showing that these pests are unusually abundant this spring and will seriously cut down the crop in the districts worst infected.

Pears will be produced in fair quantities throughout the state though the blight is quite prevalent in certain districts. The almost heroic work against this evil in some localities is expected to show the certainty of success attendant on an energetic and systematic warfare against this trouble.

Apples in some sections south of the Tehachepi are reported light, but in the heavy bearing valleys, like the Pajaro the crop promises unusually well. Watsonville reports a most unusual and well distributed setting of Newtowns and expects to turn off the largest crop ever recorded.

The outlook for grapes seems to be a flattering one in all parts and unless something unforeseen happens, the vineyardists quite generally will have good cause to rejoice.

The San Francisco disaster destroyed a great deal of canned fruit and this loss will tend to hold up prices no matter how large the crop. Reports from all sections show that we still have a hard fight against leaf curl and blight of the peach, the pear blight, the codlin moth and horned caterpillar or tussock moth of the apple. No spray has yet proved effective against the latter pest and apple growers in Central California are greatly worried over the matter. Caterpillars, while doing greatest damage to prune trees, seem to have eaten anything that came in their way. Tanglefoot fly paper and tarred strips of paper tied around the base of tree seems to be the most effective warfare yet waged.

* * *

For the Farm Boy.—The farm boys of California will be glad to know that they will have the privilege of entering exhibits in the State Fair, which opens in Sacramento on Saturday, August 25. In order to interest the boys in the fair, and at the same time interest them in rural pursuits and rural industry, the Directors of the California State Agricultural Society have decided to offer twenty cash prizes, ranging in amount from $1 up to $20, to the California school boys between 10 and 16 years of age who send to the fair the best wheat, or barley, or oats, or rye in the straw. Each boy who desires to compete must send at least four bundles four inches in diameter when tightly bound. The four bundles need not be all of one kind of grain, but may be one of one kind and three of another, or two of one kind and two of another, or one of each kind. Before shipping by freight or express, the bundles should be boxed or carefully wrapped with burlap or cloth, and along with them must be sent the name, age, photograph and postoffice address of the sender. The photographs are wanted for the society's cabinet of enterprising California boys, and from which to reproduce pictures of the prize winners for the society's next annual report.

The grain sent in will be judged by a board of competent and prominent grain growers and the money promptly sent to the winners by the officers of the society. Length and strength of straw, size and fullness of heads, and neatness of package will be taken into consideration. All intending competitors must notify the society of the fact on or before the 10th of August, so the Directors will know how much is coming in time to prepare for its proper installation, and the grain must be sent in time to reach Sacramento on or before the 20th of August. By this inducement it is hoped to get enough grain to make a splendid and striking feature of the fair, of unusual interest to visitors, and as a monument to the energy and enterprise of the school boys of California.

Address all exhibits and communications to J. A. Filcher, Secretary, Sacramento, Cal.

* * *

Great Legal Battle.—The trial of Moyer and Heywood for the murder of Governor Steunenberg at Caldwell, Idaho, is to be the occasion of one of the greatest forensic and legal battles in the history of the American bar. The authorities are trying to have the case set for June, or sooner if possible. The renowned Bourke Cockran of New York will be pitted against Judge Borah of Boise, to go down to one of the most extraordinary defeats in the annals of law and oratory. Both are orators of the most intense passion, masculine and powerful, whose every accent, glance and gesture finds its corresponding reflection in a hearer. Each has a striking personality and wide culture. It is generally believed in Idaho that Borah is twice a match for Cockran in knowledge of the law. Borah is not a prophet without honor in his own country. Cockran, looking to his plumes, will make a dramatic effort the effect of which will be splendid. Borah is bringing to judgment not only the assasins of an ex-governor of Idaho, but in the same persons also, the murderers of his beloved personal friend, Steunenberg; and this impelling force together with the dramatic setting and impressive personages will produce the mightiest and supreme struggle connected with the tragedy.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Ventura's apricot crop will be good.

The apple crop in the Pajaro Valley will be heavy.

The grape crop in Orosi Colony is promising at present.

A heavy crop of apricots is reported from the Imperial Valley.

Pajaro Valley strawberries are bringing $6 per chest in Oakland.

The oranges of Redlands for the present season are pretty much all marketed.

Grapes and deciduous fruit about Walters, Fresno County, promise a most unusual crop.

It is estimated that there is in the Pomona Valley one-fourth of all the oranges left in Southern California.

The Whittier Citrus Association offers a reward of $25 for apprehension of trespassers found in their orchards.

The apricot and almond crops of Tehama county will be light, while the peaches and prunes will be plentiful.

There will be a light apricot crop in Napa county this year, but peaches, pears and tomatoes will yield large crops.

The first car of cherries was shipped by express from Vacaville last week by members of the California Fruit Distributors.

The citrus shipments from Southern California to date have been about 18,000 cars of oranges and about 2000 cars of lemons.

Caterpillars are doing serious damage to fruits in Sonoma county and in many places have practically denuded trees of foliage.

In this State during 1905 there were over a million and a half cases of peaches canned, 624,491 cases of apricots, and 565,166 cases of pears.

A new rose farm is being established near Pomona. On a twelve-acre place, 200,000 rose bushes will be set out and grown for the Eastern market.

Orange trees have been coming into the Orosi section by the four-horse wagon load of late. There is a good orange-growing country here, and in the next few years Orosi will be noted for its production of citrus fruits.

The various packing houses of the San Antonio Fruit Exchange are rushing oranges into the market at the rate of 100 carloads a week, and this will continue for two weeks and probably three.

A dispatch from Fresno says that eight cents is being offered there for dried peaches, while canners are trying to make contracts for the green fruit at anywhere from $35 to $40 a ton.

The Clairmont Citrus Union distributed this week $19,319.82 as the second payment on its March pool. The union estimates that it has about 125 cars yet to ship. The returns for the March pool were $1.40 per 100 net to the growers.

Reports from many districts in Sonoma county, including Forestville, Sebastopol, Geyserville, Healdsburg, Dry Creek Valley and elsewhere are to the effect that caterpillars are destroying leaves on fruit trees, and are damaging all kinds of fruits.

The cherry crop of this season will be much heavier in Napa county than last year; in fact, the total output will be as much as was shipped during the season of 1903. The first car was shipped last year on April 22nd.

AGRICULTURE.

The 1906 wheat crop in Sacramento County will be light.

Lots of hay is being cut at this writing.—Exeter Sun.

This is going to be a banner year for hay in the country adjacent to Corona.

The Alhambra Farmers' Club will hold its semi-annual picnic at one of the beaches in June.

The celery crop of 1905-6 in Orange County amounted to 2276 cars; the year before it was 1799.

The California Vegetable Union shipped 15 carloads of cabbage East the past week from Orange County.

Grain crops throughout Tulare County look better at the present time than they have for a number of years.

Over 800,000 cases of tomatoes were put up last year in this State, and asparagus comes next with 228,429 cases.

In the Mound and Saticoy sections of Ventura County conditions were never more favorable for a bumper crop of beans.

The Santa Clara County Pomona Grange will meet with Orchard City Grange in an all day session May 22nd at Campbell.

There is a hopeful feeling in regard to the market for California hops. This bouyancy is a result of the bull movement in Oregon.

The farmers around Downey are getting busy with their hay crops. The outlook is fine for an extra large cutting this season.

Grain hay in Kingsburg and vicinity is ready to be cut. The yield will be quite good and the quality much better than last year.

Grain bags will be high priced this year as a result of the San Francisco fire, and sacks will be shipped from Oregon and Washington.

The rain that visited this section of the country did considerable damage to grain crops in various parts of the county.—Visalia Delta.

The melon crop in the Imperial Valley is looking very promising, and altogether the farmers down below sea level look for a very prosperous year.

It is the belief of one of the best posted men on celery in the Smeltzer section that 4000 acres will be planted this season. Last season the acreage was 3400.

The planting of lima beans throughout Ventura County is now on in earnest, and by the end of this week there will be thousands of acres of this staple article in.

The express shipments from Escondido for the past week were 201 cases eggs, 1155 pounds butter, 1240 pounds chickens, 2290 pounds cream and 3750 pounds of beans and peas.

The late rains were a great boon to farmers and orchardists in Pajaro Valley and they are taking advantage of the favorable conditions to get their soil thoroughly cultivated.

Three good showers of rain this week around Boulder Creek have been very opportune for all kinds of crops, and conditions were never more favorable than now for the farmers.

From all over the County of Ventura come flattering reports of the beet crop now growing. There are upwards of 10,000 acres tributary to the Oxnard factory planted to sugar beets.

The early onion crop of Thermal is going to bring a large sum of money to the growers. A car load of onions per acre is being harvested, 12 tons to the car. This is sold for 2 to 2½ cents the pound f. o. b.

Seventy-one hundred acres seeded to beets and an estimated tonnage of 75,000 is what perfect weather conditions this winter have brought to the farmers within a radus of six miles of the Alamitos Sugar Factory.

The San Francisco wholesale dairy and produce exchange held a special meeting at the Ferry Building last week. A sale of butter, fresh extra, was made at 19c. For fresh ranch eggs 16c was bid, and for new California cheese 11c was bid.

LIVE STOCK.

There will be a meeting of the Kings County Poultry, Pigeon and Pet Stock Association on Saturday, May 19th, and all members are urged to be present.

There has been a big increase in the butter output at the Watsonville creamery lately and the plant at present is manufacturing about 1000 lbs. of butter daily.

The last big round-up of horses in Eastern Washington has been in operation the past ten days, and about 3000 of the wild equines have been brought into the corrals.

Half-a-hundred leading live stock men of Tehama County held an enthusiastic meeting in the Court House last week for the purpose of organizing a stockmen's association.

The Tehama County Wool Growers' Association set May 1 as salesday for their clips, but no sales were made. There were a couple of San Francisco buyers in Red Bluff who interviewed the wool men but no offers were made. The wool men are asking from 28 to 30 cents for their wool.

David Griffith, who is connected with the National Department of Agriculture is here with a view to possibly locating a cacti experiment station. It is the purpose of the Government to locate in California an experiment station to develop the prickly pear into a plant of commercial value as a feed for stock.

SAN DIEGO HONEY CROP.

It is claimed by the bee men in the Escondido section that the honey crop will be unusually light this year on account of the cloudy weather. The bees in this section feed mostly upon the flowers of the white sage, and we have had so much cloudy weather the sage has not blossomed as well as it usually does. We hope that the output will be much heavier than is anticipated, and feel sure that it will be, for the reason that there is such an abundance of flowers, both wild and tame this year, that we feel sure the bees will have plenty of sweets to feed upon.

In other parts, generally, it is claimed the outlook for the present season is excellent—in fact, the best since 1884. Predictions are not based solely upon heavy sales, but also upon the fact that we have had abundant rains during the winter, and the honey-bearing blossoms are in astonishing profusion, especially on the late flowering plants.

This actually appeared among the editorial notes in the Emporia Gazette: "This actually happened. A farmer's cattle broke into a neighbor's field of corn and the neighbor filed suit in a justice court. Appraisers appointed to assess the amount of damage done to the field of corn, on examination found that the cattle had been in the field but had not eaten an ear of corn because they could not reach it. They decided that no damage had been done and the suit was withdrawn."

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO. CAL.

THE HERD.

The good dairyman raises his own cows and grades them in the line of his performance. In our neighborhood a good cow of this type sells from $75 to $80 very readily.

There are a large number of cheaper grades that find their principal use in being traded around by men who make a living selling mis-fit cows.

The cows of mixed breeding that are not bred to line but are cows bred by using grade dams and crossing first with one breed and then with another, are rarely superior as dairy producers and even when bred to a pure blood sire a per cent of their offspring will be reversions.

Among pure-bred animals crossbreeding is an abomination and makes hopeless mongrels. The two great dairy herds of the United States are the Jersey and Holstein, When crossed they are the worst mongrel. If the offspring inherits equally from each parent, they usually take the wrong side, as the small flow of Jersey milk united with the Holstein low per cent of butter fat, producing inferiority.

The Durham and Holstein make a better cow, while the Guernsey is best on the Jersey, though why anyone should cross pure bred cattle today is past finding out, for the numerous strains within each breed will give enough variety for practical improvement along any line.

There is a confusion in the mind of many people, owing to ignorance—mainly by bringing in fresh blood, as practiced the men who founded the great breeds originally did. These men carefully selected sires to increase the excellence of their selected cows and when the breeding had been continued long enough for a fixed type to be produced, one that could be depended upon to transmit to the offspring, then a herd book was formed and all animals that were sufficiently good were recorded, becoming the foundation of the herd book of the breed and then after that only animals of recorded parents were admissable to registration. Later in dairy cattle a second or Advanced Registry was formed and only recorded animals could compete. These had under official inspection to make more than a certain amount of butter within seven days. It simply was a removal of the records of amount of butter from a "say so" idea to an exact account. It was wonderful how some famous cows fell in their productions when the amount was calculated by a disinterested party and no estimate of amount of milk fed calf, or used in the family, were made to be added to the total.

The need today is for owners of pure bred cattle to recognize that careless mating causes deterioration. The idea of using any pure bred sire must be given up. There should be at least three sires in a herd of a hundred cows. The owner, then, should study the cows as carefully as possible, measure and score them, and then choose the sire that will breed out the defects. The high cut or short cut udder in front, the high shoulder, the beefy thigh, the coarse head, and the drooping flank, are all to be bred out of a herd. The faults of conformation are defects in the breeds. Now the scale of points has been built up by the wisest breeders and has been amended again and again by the members of the association until it represents the wisdom of many most learned in the science. The scale of points therefore is not nonsense but a carefully built up system of judging a perfect physical animal. While there may be an occasional animal of superior excellence that is defective, it is because she has overcome by latent qualities, not because of her lack of form. Her weakness will not become strength for transmission of good except she be carefully mated to breed away from them. And even then her sons I should not use to head a herd of pure bred cows; no matter how phenomenal a butter maker she might be, for I should regard her as a freak rather than as a vehicle to carry high quality to her descendants. Her descendants I should use and try to breed strongly away by using sires from dams that were true to type.

The training of the calf begins when it is taken from its dam, and takes its milk from the pail. The sooner the grooming begins the gentler the calf becomes. The udder and teats should be handled and the little one must be carefully protected from having other calves trying to nurse her or else the tender udder will be dragged out of shape.

The importance of keeping the heifers growing rather than fat is apparent, so a little grain while they run on grass helps. I would rather run them on short grass than on heavy alfalfa, giving them some hay and grain. When on heavy alfalfa they grow fat. Instead of being lean and muscular they had better be more like the deer rather than beefy. The calves raised for exhibition purposes are not as well fitted for future dairy usefulness as the more lean less pretty calf kept at home. In California the calves run out all day and have a shed filled with clean straw for night use. This makes them rugged and sickness is rare if the sheds are whitewashed and their manure removed frequently.

Exhibition ring spoils both cows and owners for dairy purposes, for the judges are influenced by condition, while a heavily milking cow or a heifer that is lean has little chance to pass up to a blue ribbon.

The performance record of a cow sometimes tells even against this. A winner at our State Fairs for some years has had a cow that has no type of her breed. She has even won over cows that were typical animals.

BUTTER TAINT.

Mr. P. H. Kieffer of Iowa, who scored the butter at the late Minnesota convention at Mankato gave a very instructive talk afterward, concerning the butter and its faults. Here are some of the things he said:

This had a sort of flavor that we sometimes call "barn" flavor. This barn flavor we traced down in Iowa and found it is due to unclean conditions—it is uncleanliness. It is a bacterium. There are two different kinds of taints, bacterial and mechanical taint in cream, and in butter.

When we find it is a mechanical

U S U S U S
World's Champion Cow
The Guernsey cow here illustrated has proven herself the biggest butter producer in the world. This letter tells the story.

"Milwaukee, Wis., Feb, 12, 1906.
My Guernsey cow, Yeksa Sunbeam, No. 15439, holds the World's record for a yearly butter-fat production, having made in a year 857.15 pounds of butter-fat. She also made 14920.8 pounds of milk testing 5.75 per cent. fat; this is the largest amount of milk produced in a year by any Guernsey cow.
The butter exhibited from my farm was awarded FIRST PRIZE over all at the State Dairymen's Convention at Waukesha, Wis., scoring 97½ points.
I use the United States Cream Separator, of which I have three on as many farms. Fred Rietbrock."
Don't miss the point of this story: GOOD COWS and the
U. S. CREAM SEPARATOR
is a combination that means biggest profit to dairymen. You feed your cows to produce rich milk, and to get the most butter-fat from that milk you need a U. S. Cream Separator because it Holds the WORLD'S RECORD for CLEAN SKIMMING.
Our new, handsome 1906 catalogue tells all about the U. S. Read it before you put any money into a cream separator. Just write us, "Send catalogue number [illegible]". You'll get one by return mail. Better lay this paper down and write us now while you think of it.

H. N. WILLIAMS COMPTON, CAL.

taint we do not lay that to the buttermaker, do not lay it to the man taking care of the milk; it is laid to the cow; but when it is a bacterial taint it is caused by something getting into the milk or cream after it has been milked. That is what we call bacterial taint, and a mechanical taint is something that has got into the milk by the feed the cow ate. That kind of taint never grows any more. You can take the milk from the cow and set it at a high temperature and that flavor will stay just the same, but a bacterial taint will develop at high temperature and you can grow it and it grows stronger. We lay the trouble in our butter to feed sometimes, but in tracing it down it is usually bacteria and not a mechanical taint.

These bacteria get in either in the stable or by straining the milk through cloth that became yellow through use in straining. That will give you very foul bacteria and that may be the cause of this barn flavor. In Iowa, at a creamery there, the butter was running off not very bad, but about 92, this was at a whole milk creamery. We went through the milk and found just one can of milk, eighty pounds in the can, and we took this can of milk out of the day's run and the next day the butter was all right. We ran this can of milk through the separator and I took some of the cream home in a milk jar, churned it at home and it had the awfulest smell I ever noticed. I sent it to the agricultural college at Ames and they carried it there for two weeks; that taint grew and it was a bacterial taint. It was simply dirt. That paper that was read here yesterday by Mr. Shrewsbury I enjoyed very much. It is a paper that ought to go into the hands of every man that is milking cows, because that is the foundation of quality. The farmer is the man that is the foundation of quality, and you can educate your buttermakers to the highest standard and if you do not give them the raw material they will not be able to satisfy you.

When the farmer who produces the milk really believes what Mr. Kieffer says, that he is the foundation of quality, then we will have gilt edge butter in every creamery all bringing the highest market price. But so long as the farmer does not believe that great truth, things will go as unsatisfactory as they have gone.

Hoard's Dairyman has been hard at work for years trying to pour light in upon the farmer's mind on this great question, but it can do nothing with the 90 per cent, who cannot be reached by papers or books, and yet they want to make just as much profit as anybody, while they are all the time destroying their profit. The things Mr. Kieffer speaks of are happening every day at nearly all the creameries, especially with these who take gathered cream.—Hoard's Dairyman.

VALUABLE COWS.

C. W. Leffingwell of Whittier writes as follows regarding his fine Jerseys:

Editor Cultivator:—Your readers will be interested to know that two more cows of our herd have completed yearly authenticated fat estimates, large enough to enter them in the Advanced Registry of the A. J. C. C. Russet Duchess, No. 160014, gave milk, 8444 lbs. 15 oz. and butter fat, 411 lbs. 14 2-5 oz.; this cow scoring sufficient points to become eligible, has been entered in Class A.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

Write for Illustrated Folder

FOR SALE

RUSSETT DUCHESS, 160014

ADVANCED REGISTER, CLASS A, A. J. C. C.

This cow has recently completed a Yearly Authenticated Fat Estimate, giving milk, 8445 lbs., 15 oz.; butter-fat. 411 lbs., 15 2-5 oz. She is a daughter of Vela Hastings, Advanced Register, Class A, with a similar record, of milk, 7486 lbs., 3 oz.; butter-fat, 450 lbs.

Due to calve May 30, to Sargent Fox. For price address

C. W. LEFFINGWELL, JR., WHITTIER, CAL.

Winksette's Regina, No. 149188, gave milk, 8874 lbs. 13 oz., butter fat, 497 lbs. 13 oz. We were unfortunate in losing her from milk fever before she was scored so that we have had to be contented with entering her in Class B. A matured cow must give 400 lbs. or more of fat for entry in this Advanced Registry, and to get into Class A must score 80 points or better.

Owing to our land being all planted in orchard we have decided to reduce the number of our herd and keep only about five cows in milk; our experience would indicate that better success in breeding can be attained by sticking to one family and we have therefore decided to make a specialty of the Winksette family, with which we have had splendid success. We have some magnificent cows of other strains which are therefore for sale and at prices which will prove very attractive to those who fancy the several lines of breeding which they represent. We have not a cow in our herd that has not made a record large enough for entry in the Advanced Registry, and we have some great yearling heifers from these cows by Sargent Fox, all of which are for sale. It will be our purpose to advertise each animal as she freshens and we hope that they will go into good hands where they will be appreciated. The one offered for sale this week in your columns, Russet Duchess, is a large hardy cow with good udder and teats, giving about four gallons when fresh and milking with great persistency through the year. With such a cow a family need be without milk only a couple of weeks each year; as for her offspring, her yearling heifer by Sargent Fox is a beauty, of unusual promise.—C. W. Leffingwell, Jr.

If low and unprofitable prices for farm products could be prevented in the future, we believe this country could be guaranteed seventy times seven fat years and then some more. Keep the millions of farmers contented and prosperous, and no great industrial calamity can befall the nation.

The dairy cow should be bred for generating in milking lines, she should have a typical dairy type, and a strong vigorous constitution and dairy capacity.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

THE CUTTER LARORATORY

Berkeley, California

SAN FRANCISCO FIRMS.

In addition to the business firms heretofore mentioned the following San Francisco houses are located (some temporarily) as below given. Most of them are old time advertisers in this paper, some are now represented and others will be as soon as they are ready for business:

The Krogh Mfg. Co., have opened a temporary office and works at 2124 Folsom St., San Francisco. They have in stock all sizes of centrifugal pumps and will be able to make prompt shipments. Orders sent them will have immediate attention.

Peter Bacigalupi's phonograph agency has been removed to 1113 Fillmore St.

The Pacific Implement Co., 133 Kansas St., was not damaged by the fire. Their factory buildings escaped and they have a full stock of implements. They can make prompt shipments at any time. They were too busy to send copy for their advertisement this week but soon will continue their announcements in the Cultivator.

Balfour Guthrie & Co., importers of phosphate powder and nitrate of soda lost their San Francisco office and have opened up temporarily at 2110 Washington street, San Francisco. All orders for fertilizing materials can be promptly filled as they have stocks at Fresno and Los Angeles to draw upon.

The National Wood Pipe Co., have opened a temporary office at 518 11th St., Oakland, and are able to fill all orders promptly as their factory was not injured.

The Byron Jackson Machine Co., have located at 18 Telegraph Ave., Oakland. They have made arrangements whereby all orders can be filled and have also arranged for a new site on which will be erected new works much larger than their old ones and they expect to be in full operation within sixty days.

Fairbanks, Morse & Co. are located at 969 Broadway, Oakland, where they will fill orders from their Oakland stock and also from their branch at Los Angeles. They expect to be back in San Francisco very soon.

Harron, Rickard & McCone have secured a new location at 7th and Berry Sts., San Francisco. Their warehouse was not injured and they are able to fill all orders.

The Polytechnic Business College, 12th and Harrison Sts., Oakland, were fortunate in not sustaining any great damage. Their school is going right along and the summer session is now open.

Breuner Bros., the big mail order house, formerly at 127 Bluxome St., and also at 426 Townsend St., were completely burned out. Their loss was about $1,000,000. They are starting the John Brenner Co. at 12th and Harrison Sts., Oakland, and have just completed a new frame building. Orders and cash for goods sent to San Francisco house are being returned. Anyone having occasion to write to their San Francisco house should address correspondence to their temporary office at 951 Eddy St., San Francisco.

The West Coast Wire & Iron Works were entirely destroyed by fire, losing both factory and stock. Their new address will be 134 Hanover Ave., East Oakland, until further notice.

The Paraffine Paint Co., factory was not injured and their temporary office is in the Union Bank Building, Oakland.

Baker & Hamilton's big supply house will be found at 113-117 Berry St., near Third and Townsend Sts. Their Los Angeles house will also supply all demands.

W. P. Fuller & Co. did not lose their factory and they are, for the present, located at 412-414 12th St., Oakland, where all San Francisco letters should be sent.

Woodin & Little, formerly at 209-211 Market St., have opened a temporary office at 701 Scott St. Their fine stock of goods was completely wiped out but they will resume business as soon as a suitable location can be found.

Pascal Dubedat & Co. lost their entire stock and will not be able to supply more than fifty per cent of their regular trade for some time. They will be in a new location and ready for next season's business.

M. Bettman Co., importers of all kinds of chemicals, rosin, etc., have opened new offices at 1355 Post St., San Francisco, and are ready for business. They are advertising caustic soda at present.

The Imperial Cash Store, formerly at 532 Washington St., have a temporary home at 325 Church St., and will soon be ready for business. As yet they have not found a desirable location.

The Western Meat Co. lost their general offices and wholesale market at 6th and Townsend, but their plant at South San Francisco remained intact and is running as usual. All correspondence should be addressed to South San Francisco, San Mateo Co., where their business offices are now located. They are fully prepared to take care of all business and later will be back in a good location in the city.

The Burr-Paddon Real Estate Co., formerly at 40 Montgomery street, have opened a temporary office at 1909 Fillmore street.

The San Francisco Sulphur Co., were wiped out but have opened an office at Utah and Alameda streets, San Francisco. They will be ready for business soon and by the coming season will be in shape to supply all customers.

The De Laval Dairy Supply Co., were burned out among the rest and have opened on office at 309 12th st., Oakland. As their branch houses at Los Angeles, Seattle and Portland are well supplied with their goods, business will be continued without interruption. Write them as above.

Francis, Smith & Co., have opened a new office at 8th and Townsend st. Their old office was destroyed but their works were damaged but slightly and they are able to promptly fill all orders for irrigating pipe and water tanks.

Smith's Cash Store was among the first to be burned out and among the first to resume. They are at 16 Steuart street and are filling all orders for groceries and hardware promptly. They wish to thank all old customers for past patronage and will be pleased to receive their orders and also to reach as many new ones as possible.

C. C. Morse & Co., seed growers, whose handsome advertisement has greeted the readers of the Cultivator sustained loss in the fire but their wholesale warehouse at Santa Clara was not injured. They are without a definite location at present and letters should be sent them for the present to "general delivery" San Francisco. Their street number will be announced later. As soon as a good locatio can be secured they will be as fully equipped for business as before the fire.

The Pacific Coast Borax Co., lost their office but are now located at Room 80 Bacon block, Oakland. They are fully prepared to fill all orders and can supply their goods on the shortest notice. No change is made in their advertising except the address above stated.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

A SUCCESSFUL BROILER RANCH.

We all like to hear of the successful achievements of others and I think the account of my visit to a broiler ranch will interest many.

I am still away "attending Farmers' Institutes" and incidentally meeting with nice poultry breeders and seeing a few of the many successful poultry plants in the country.

Yesterday I had to wait at beautiful Oceanside for several hours so I telephoned to Mr. Culver of Carlsbad that I would like to see his poultry plant and especially his large adobe incubator planned and commenced by J. P. Jones, who built the adobe incubator at the Mission View Ranch at San Fernando.

Mr. Culver promptly appeared with his large automobile and took three of our party to his ranch three miles away as easily as a bird would fly.

Arrived there we first visited his three brooder houses, two are one hundred feet long, and the third measures one hundred and fifty feet in length. These houses are large and airy, the ventilation seemed perfect. The brooders are home made by Mr. Culver, who appears to have a genius for inventing, and are heated by a pipe system of his own. The brooders are fourteen feet long by two feet wide, and Mr. Culver tells me the chickens do not crowd and are perfectly healthy.

In proof of it he showed us the six weeks old chicks from his first hatch. He bought the eggs, mostly from Santa Ana commission houses or ranchers, at market prices, out of 2400 eggs of various breeds (or no breeds for he discovered a hundred duck eggs in the lot) he hatched two thousand and ten chicks, of these now over six weeks of age, he has only lost fifteen or less than one per cent.

Mr. Culver feeds by the dry hopper system, keeping dry chick-feed before the chicks all the time, he says he finds this by far the best way he has ever tried. He has been eight years in the business, and he has had lots of experience in that time.

He makes all his own hoppers, as well as his brooders. He keeps grit, bone, and charcoal always before the chicks, besides clean fresh water. The water fountains are glazed stoneware jars, each holding about half a gallon of water, these are inverted into an earthenware plate, like a pie plate.

What impressed me most in his place was the extreme cleanliness and neatness.

"Yes," he said, "I never have any lice or mites, but I fight them just as if they were there."

He and his industrious little wife clean the brooders every day, fill up the hoppers and keep the water fountains full twice or three times a day. Cleaning and filling fifty water fountains is no light work even when

BUYS THE WORLD'S FAMOUS
EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you NOW have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line ☞

Ask for particulars about our FREE TEST Plan. Write today—you can't afford to wait.

Hager's Egg Preservative Co.
St. Louis, Mo.

every thirty feet there is a neat little sink and water faucet.

There were between four and five thousand chicks in two of the houses and another hatch coming out tomorrow, which will tax the capacity of even his largest house.

The most interesting part of this broiler plant is perhaps the mammoth incubator built of adobe. It is an octagonal room sixteen feet in diameter, with shelves all around it except at the entrance, and shelves around a pillar in the middle. The shelves contained about five thousand eggs, although they are built to hold eight thousand.

The five thousand were due to hatch the next day and could be heard talking in their shells, whilst some of the energetic Leghorns were emerging as we watched them, a day too soon.

To see five thousand eggs at one glance is quite interesting and I could imagine the hatching.

The thermometers were standing at 103 degrees and the hydrometer at 75 degrees. Mr. Culver informed me that the heat did not vary in the least, he could keep it at exactly any degree he wished, and the atmospheric moisture also, but one very interesting point was that this year, in order to dry out the eggs sufficiently, to have a good hatch, he had to keep the air much drier, than ever before, he kept the hydrometer about 45 until the last week.

He said many people in his neighborhood were having poor hatches and he attributed it to the damper weather we are having this year. His system of heating and ventilation is about perfect. He uses distillate as fuel and one hatch costs him between eleven and twelve dollars only, whilst by the old plan of incubators he formerly used such a hatch would cost more than three times as much.

"Does a broiler plant pay?" I asked as we were leaving this most interesting ranch. Mr. Culver smiled and told me he had just put six hundred dollars into improving the plant and he expected to get that and more back. He said he could not supply the demand. The little cockerels he sold as broilers, the pullets he sold usually to neighboring ranchers as soon as they were weaned from the brooder, getting more for them than for the cockerels.

"Yes," he said, "a broiler plant pays, but you can't run an egg farm as well, one line of business run properly will pay, most people try to do too much. Better stick to one thing and do it well."

DON'T BE A CHUMP

Breathes there a man with soul so dead that to himself he never said, "My trade in chicks is getting bad, I'll try another ten-inch ad." If such there be, go mark him well. For him no bank account shall swell, no angels watch the golden stair to welcome home a millionaire. To such a man the noisy din of traffic may not enter in, for bargain seekers by the score shall pass, nor heed, his dingy door. Tread lightly, friends, let no rude sound disturb his solitude profound. So let him live in calm repose, unsought except by men he owes. And when he dies, go plant him deep, that naught may break his dreamless sleep; where no rude clamor may dispel the quiet that he loves so well, and that the world may know it's loss, place on his grave a wreath of moss and on the stone above: "Here lies a chump who would not advertise."—Exchange.

The egg is sometimes so strong shelled that the chicks cannot break out. Some have found that by withholding the oyster shell for a little while before eggs are saved for setting, the eggs are not so thick shelled. Where bone meal, oats, etc., are fed, the egg has a very good shell without oyster shell. But this should be done only for eggs to be set.

The keeping quality of eggs is a very different matter from fertility. It is the general belief that infertile eggs keep better than fertile.

Poultry and Eggs Wanted

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

SIX MONTHS TRIAL

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX MONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our **ON TIME PLAN,** and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—it will be mailed to you free.

Geo. W. Foott, Box 2040, Portland, Ore.

THE CARE OF POULTS.

Go to the nest when the little poults are hatching, remove them as fast as they dry and place them in a flannel cloth in basket or box in the house until the mother has completed her hatch, says the Feather.

Never feed them until at least thirty-six hours old. Then give them hard boiled eggs crumbled with black pepper. To them nothing seems more wholesome. Feed scantily and at least every two hours.

An ideal coop for little turkeys is a large box, four feet long, three feet wide and two and a half feet high. Remove the bottom of the box and make a slanting roof, leaving no floor whatever but nature's carpet—soft green grass—and change the coop to a new location every three or four days. Slat the front of the coop, that they may come and go as they please. Let the mother hen remain in the coop until the poults are about three weeks' old. Give plenty of good fresh water and sunlight. Never use sour milk, except in the form of cheese, of which they are very fond.

The coop should be inclosed by a little yard of broad boards for at least a week, as the little fellows will follow every chicken or fowl that passes the coop, often running so far away they can't get back, thus causing many a step that with a little trouble and precaution may be avoided. Keep plenty of fresh water constantly by them.

When the poults are a week old grease the mother hen on vent, under wings and on her head to prevent the lice infesting the little ones. When the poults are three weeks old grease them on wings and around navel. Be very careful and dont' use too much. Never grease the head of a young poult. Repeat again in three weeks. To keep little poults free from lice is one of the most important essentials in turkey raising.

Never place them on board floors, as it causes leg weakness and disease. Close up the coop at night to prevent them from running out in the dew of early morning. As soon as the grass dries turn out the hen and poults together. They will return to the coop when they get hungry. See that they have clean quarters, plenty of fresh grass, clean fresh water, boiled eggs, millet, cheese, beef meal, corn bread and sweet cream.

W. E. Mercer - - Ventura, Cal.

EGGBOUND HENS.

Sometimes we have had trouble from hens becoming what is called "egg bound." This is caused by excess of fat, constipation or an unusually large size of the eggs. Mr. Valentine in the Tribune Farmer gives the following treatment for this trouble, which is by no means rare:

"In simpler cases the injection of a little olive oil, with gentle rubbing in a downward direction, may be all that is needed for the expulsion of the egg. In more stubborn cases it is recommended to hold the posterior parts in warm water until the muscles are relaxed, following this by the treatment previously noted. In extreme cases some puncture the egg and remove it piecemeal, using emollient applications later. It is only in the case of valuable birds that so much trouble is worth while. Ordinarily, considering the liability to recurrence, the best thing to do is to use the bird for food before she gets really sick or is lost in an acute attack. Fluid extract of ergot in five drop doses three times a day is recommended for the help of this tendency.

There are many manifestations of ovarian troubles or those of the egg duct which seem quite freakish, doubtless because we do not understand their cause. One season when I raised Leghorns exclusively, about one out of five of all the pullets that laid early in the fall was egg bound, and most of them died. All the young ran together until six months old, and to this I attribute the trouble. It has never appeared since after this fashion, although it might be expected, since the Browns lay a large egg for their size, and the pullets fatten easily, but the eggs are uniform, seldom an abnormal size."

HOW THE MORTGAGE WAS PAID RAISING POULTRY

"Why, cousin John!" exclaimed Eliza Jane as she opened the door in response to his loud knock. "Yes, Eliza, I've come to pay you folks a visit. see, I can afford it now, I've paid the mortgage on our farm." "Paid the mortgage, have you John?" exclaimed Uncle Joshua, as he caught the young man's hand. "Mighty well done. And you've been very steady at it. A faithful son you've been to your mother, my boy. Poor woman, she has not been the same since your father died," and Uncle Joshua's face grew sad for he was very fond of his only sister upon whom so great a sorrow had fallen.

"I've done my best, Uncle, and I've succeeded quite beyond my expectations."

"But you must tell us how you did it," said Aunt Ellen, when she was able to get in a word. "Well, I'll tell you; but I'd like some of that delicious supper first," replied John as he cast a look at the dining table laden with all the wholesome food a farmhouse affords. "I've come a long ways and I'm mighty hungry."

"Why, we forgot all about supper when you came," said Aunt Ellen. "Poor boy, you must be hungry! Come right in and have your fill! We were just going to sit down to eat when we heard your knock and of course, we all had to see who it was!"

"There, I feel better now," said John as he arose from the table after his hearty meal.

"Now for your story," said Eliza Jane.

"Well," said John as his face grew sad, "you know that some years back

$1500

For the above sum, Captain Mitchell of Santa Barbara will sell his poultry business and good will. The outfit consists of 1000 Standard Bred S. C. White Leghorn laying hens and pullets and their fixtures, i. e., Brooders, Houses, Posts; 6 foot "Union Lock" Fence Wire, Etc., Etc.

Sales of eggs for hatching average 14,000 per year at $70 per 1000, and the net income per annum for the last four years has been from $1000 to $1500. For further particulars apply to

Breeders of S. C. White Leghorns Exclusively

Fine Feathers alone do not make the profitable hen. Our fowls have the reputation of being ***extra large, handsome*** and ***extra heavy layers.*** Last season, our eggs averaged over 95 per cent. fertile. ***Remember***—In getting eggs from us, you do not get them from the general runs. We have but one grade of eggs to sell for hatching and those are from our breeding pen composed of only the choicest fowls, selected from hundreds that are ***bred to lay.*** Hens that approach the ***200 egg record.***

Price of Eggs—$1.50 per 15, $5 per 100. ***Send for Illustrated Catalogue. Address,***

LEO. W. MARDEN, Manager

we bought our farm. Then father's health failed and he was ill so long that our little savings were soon at an end and we had to mortgage our farm to pay our bills.

"After father died, mother and I were left alone with three small children and a mortgaged farm. I was needed at home and, for a while, all seemed dark as night. Then, one day, farmer Jones, who has a chicken ranch about twelve miles from here, suggested that I raise chickens.

"'That will never pay the bills we owe,' I said discouragingly.

"'I know it will,' he replied, 'and if you need advice, come to me.'

"I thanked him very kindly and when we parted I commenced to think seriously about it. The result was, that, in the end, I bought some good laying hens and some good setters from Mr. Jones. I could not start on a large scale as I lacked the money, but I got a large experience the first year. Had many losses because I was green, and was often discouraged. But Jones always helped me and I finally began to win.

"I kept all the full-blooded hens together. Ten hens to one rooster is my rule. I also keep the small chicks apart from the large ones, because they require different care.

"I supply the chickens with good, dry, airy coops. The nests I inspect every little while to see if there are any lice in them. I also burn the straw and smoke out the boxes once in a while to be sure they contain no lice eggs. A hen will often leave her nest when the eggs are almost ready to hatch, because the lice bother her so she cannot set in peace. I always keep the houses whitewashed as that seems to assist in keeping insects away. Then I make scratching sheds for exercise in winter.

"Every cold morning I give them warm water to drink, and if possible, warm food. Shorts mixed into a dough with warm water, and a little red pepper is excellent. Besides that, I feed them wheat screenings, ground bones, oats, grit and oyster shells. I found out by experience that green bone was good, so I bought a little bone mill in which I could grind bone, oyster shells, etc. I also found that the hen that lays must be a busy hen. At the same time she must be tame.

"The small chickens need much care. I see that they have a dry house where no draught enters. The small chicks are fed often and a little at a time. I feed them rolled oats, bread and cracker crumbs and when they get older, wheat and corn.

"I set hens the first year, and when I got enough money, I bought an incubator. At first I bought only one, but it soon paid for itself and I bought another and so on until I have three. Of course, I got brooders with them. In that way, it is not so great a task to care for the chicks as if I set them under hens, because there is no mother to lure them into all kinds of places. The brooders, too, keep the same temperature when properly tended. Then, too, I had all the chicks together, which is a great help. I find that my incubator chickens are just as hearty or even more so than the ones hatched under hens. And considering the eggs, I raise more chicks to the dozen eggs in the incubator than to the dozen eggs under the hens. It is the incubator that brings in the dollars.

"All my fresh eggs I sell to customers in town and get higher prices for them than I could from the merchants. I sell the manure to a market gardener and florist. The feathers I also sell. So you see I make use of everything; and the result is that in five years I have paid the mortgage on father's farm and am now well established in the chicken business. There, I guess that's all. What do you think of it? Of course, I made many mistakes but I found out that experience was the best teacher."

"Yes, and Farmer Jones told me yesterday that you were one of the pluckiest and luckiest men he ever saw. You started with nothing, you know," said Uncle Joshua.

"Well, I can thank Mr. Jones for that. He suggested it to me. Any man could do it if he would. He's a good man, that Jones," said John.—Successful Farming.

NEW USE OF TRAP NEST.

One of the correspondents of Feathered Life says that trap nests, aside from telling which fowls lay the greatest number of eggs, may be used to ascertain which hens are producing the eggs that are clear or incapable of being brought to a successful issue when incubated under artificial conditions.

During the many years' practical experience the writer has had in the operation of incubators, he has generally found when testing eggs that those which were unfertile or addled have been the produce of some particular hen or hens. In testing eggs last season it was found that such eggs as failed to survive the period of incubation were almost without exception marked with the same numbers. For instance, out of twenty-three eggs marked nine, eighteen failed to produce chickens, and the few remaining eggs though hatching out, produced chickens of a modest delicate nature.

Now, it is quite possible to ensure hatches of greater percentage by weeding out from the breeding stock such birds as fail to produce good, hatchable eggs, and to do this we must resort to the use of trap nests. If each laying hen has a numbered ring on her leg, and trap nests are used, and the eggs are marked at the smaller end when laid, we shall be able to ascertain from what birds the majority of clear and addled eggs come, when such birds can be removed from the breeding pens and the incubators filled only with eggs from such hens as are reliable breeders.

While the poultry industry is an important one in Germany, it is said that incubators are almost unknown there, consequently in this very important part of farming the Germans are far behind the Americans.

Blue Andalusian Eggs
$1.50 for 15, $7.00 per 100. Free range. I raised and sold cockerel winning first prize at late L. A. poultry show. Stock. ***Mrs. J. S. Duff, 3145 S. Hoover St., Los Angeles, Cal.***

THE TRANSPORTATION OF FRUIT IN REFRICERATION.

Continued from first page.

ment before the peach develops flavor quality or the highest color. The fruit arrives with a flat, insipid flavor, giving the section the reputation for producing fruit of inferior quality. The western peach is a luscious fruit when ripened on the tree. In the future competition among localities in the markets of the world, such a region must appear at a disadvantage unless the fruit has some redeeming merit other than quality that makes it acceptable to the dealer and the consumer. The problem that the western peach grower wants solved is—and this applies to other perishable deciduous fruits of the west—how can the fruit be handled after it has developed a high color and a hard ripeness on the tree so as to lay it down in sound condition in all parts of the cargo in distant domestic or foreign markets. On the solution of this problem depends the future development and the permanent stability of the peach business of the Pacific Coast.

* * *

The Effect on the Citrus Fruit Industry—We will refer to the citrus fruit industry as a third and final example. The losses from decay in transit in the orange and lemon from California amount to about one-half million dollars annually. The orange is wrapped and is packed tightly in boxes that weigh 72 pounds when full. The packages are stacked on end in the car, usually two tiers high. After the first of March, the fruit may range from 60 to 90 degrees in temperature when loaded. The temperature of the air in the refrigerator car may drop to 40 to 50 degrees in three to ten days, but the fruit in the center of the package remains several degrees warmer for many days. As a result, the decay in the fruit in the top tier of packages is greater than in the bottom, often by 10 per cent and worst in the center of the package in both tiers. We know that the orange can be stored safely for many weeks at 40 degrees temperature if the fruit is stored quickly after picking. The problem that the California citrus fruit grower wants solved is, how can the fruit be handled so as to insure the safe arrival of all parts of a cargo in the most distant domestic and foreign markets. California now produces 30,000 carloads of citrus fruits. The problem will need to be solved in the near future to prevent temporary domestics gluts by the opening of more distant markets.

We might multiply examples indefinitely to bring out the relation of the present methods of handling fruits for transportation to the limitation of their markets, but the typical references already made will indicate the nature of the problems we have in mind.

* * *

Losses not all Caused by Transportation—We would not leave the impression that all of the losses in transit in perishable fruit are due primarily to the conditions surrounding it in transit. On the contrary, many of the most important commercial losses from decay in the thick skinned fruits, like the apple and the orange, are caused largely by the rough treatment of the fruit in picking and packing, thereby making it susceptible to decay. Fruit that is perfect physically may be landed in distant markets in sound condition even under adverse conditions in transit, but bruised fruit is likely to develop losses under the most favorable condtions in transit. We need to reform the methods of handling the fruit crop in America fully as much as we need to improve the transportation conditions. This phase of the subject is one, however, which which cannot be handled in this paper.

* * *

Improvement Needed for Safe Transportation.—From the standpoint of the keeping of the fruit in transit, an economical, practical method is needed to reduce the temperature of the fruit more quickly after packing than is accomplished by the ordinary refrigerator car. A more uniform distribution of the air in the car is also needed. Nearly 400 patents have been taken out in the United States with a view to improvement in the refrigerator car service. The patents cover construction, air circulation within the car, ventilation, the capacity and arrangement of ice tanks, mechanical and chemical refrigeration, and various other subjects. There has been an enormous improvement in the efficiency of the refrigerator car since the first patent in 1867. The improvements have usually been attempted by modifying incidental features of existing cars, and those in practical use have been selected with a view to the requirements of modern railroading. Complicated mechanism, of which there are innumerable instances in the patents referred to is apparently impracticable when applied to the modern refrigerator car. Anything that delays the movement of trains or is beyond the skill of the average brakeman to handle is clearly out of place. I do not care to express an opinion as to the possibility of improving refrigerator cars along the lines mentioned. I would refer those problems to you gentlemen as expert engineers, and I would propound these questions for your further consideration:

1. Is it possible to construct a refrigerator car to be cooled with ice that will refrigerate a load of strawberries or peaches in hot weather quickly enough to check the rots and the ripening of the fruit in the warmest parts of the car?

2. If not with ice alone, then with ice and salt, with liquid air or by other chemical or mechanical refrigeration, keeping prominently in view the fact that complicated mechanism is of doubtful utility in the handling of the refrigerator car service.

These things have not been fully accomplished by the 400 patents on refrigerator cars. If it is not practical to do so, then we would propound the further query: Should a refrigerator car reasonably be expected to accomplish the initial refrigeration of the most perishable fruits in hot weather and to maintain the refrigeration afterwards, or, should we ultimately expect the refrigerator car to transport safely perishable products that are placed in the car in good condition for transportaton? Under present methods of handling fruits, the losses originate largely during the period of slow initial refrigeration. In the fresh meat trade this difficulty is obviated by refrigerating the product before shipment and by maintaining a lower temperature in transit by the use of ice and salt. Perishable fruits from Australia to the United Kingdom are likewise refrigerated before shipment. Most of the Eastern grown Bartlett pears are refrigerated in warehouses before exporting. Bananas are now being cooled in train loads in transit, and it is proposed to refrigerate the canteloupes in the semi-arid Imperial Valley of Coachella, California, before shipment to the East.

* * *

Cooling Fruit Before Shipment.—We know that many of the large commercial losses in perishable fruits in transit would be overcome if a practical method could be devised of cooling fruit sufficiently and economically before shipment, provided an equal improvement in the method of handling the fruit in the orchards and packing houses can be brought about. We know that the refrigerator cars in common use, when well iced, will maintain a uniform temperature of 35 to 40 degrees in a load of fruit indefinitely, that the fruit can ripen more fully on the trees if cooled before shipment, that the differences in maturity between the fruit in the top and bottom of the car is largely reduced, and that the fruit arrives with better quality, as the air of the car is dryer and purer during the trip.

Therefore I desire to ask you to consider the following questions:

1. Is it practical to construct warehouses at fruit shipping points, to be operated as a private or a transportation enterprise, at central packing houses or on large fruit ranches for the quick cooling of fruits, the probability being that the warehouses would be used a comparatively short period of the year unless it could be combined with a cold storage and ice-making business?

2. Is it practical without interfering with the movement of traffic to refrigerate fruit initially in cars by blowing cold air through the car from a refrigerating machine.

3. If the fruit could be loaded at a temperature of 35 or 40 degrees, could the freight-carrying capacity of the car be increased by closer piling and higher loading without endangering the condition of the fruit?

4. Could the capacity of the ice tanks be reduced, the temperature of the fruit still be maintained and the carrying capacity of the car be further increased under this method of treatment?

5. Does any method of maintaining a low temperature seem more practical than the use of ice?

These are some of the fundamental problems that the fruit grower has to face in his effort to build up the American fruit industry. They are not problems that can be settled offhand by the grower, the shipper, the car line, the railroad or the engineer. The interests of each are closely interwoven with the interests of the others. We submit the refrigerating problems for your consideration, with the hope that their importance may seem worthy of your attention.

"Are you interested in Panama?"
"Oh, yes, very much. That's the place George's hat came from, isn't it?"—Brooklyn Life.

Queries and Replies

BEES ROBBING.

Editor Cultivator:—Will you please tell me how to prevent bees from robbing? Subscriber.

Close the opening in the hive so that there will only be room for one or two bees to pass at a time. This will give the guards or sentinels a chance to "swat" every enemy as he enters. A weak force can stand off a single file of invaders, but when they pour in six or eight abreast, they can't stand it. If you catch the robbers at work, throw some water in the entrance to the hive till you get it regulated. These are only remedies. The preventive is to keep the colonies strong and they will not be robbed. This is accomplished in a number of ways. Do not take honey from such swarms while weak. If they do not seem to pick up, change the queen or take some frames of strong brood from a good hive and give them to the weak ones. Do not leave any waste honey or scraps of comb with honey in them where bees can get at them. Any person wishing to engage in bee culture should secure a bee book.

LEAF OF PLANT.

Mrs. L. D., Wilmington—It is almost useless to send in a leaf for identification for no one could tell with certainty what such a plant is. It is a guess at best. Flowers should also be sent and also all information possible. Some plant genera consist of 10—50 species all much alike even in the flower and precisely alike in leaf, habit, etc.

BLACK SCALE.

Editor Cultivator:—Can you tell me which is the best and cheapest way to free small orange trees from black scale. They have been put out one year. L. B., Anaheim.

Have them gassed in the regular way at the proper time. This is in the fall. Your local inspector can advise you about the time, as different localities develop scale at different periods.

ALKALI ON LAWNS.

Editor Cultivator:—There are two spots in my lawn which contain alkali. I flooded and washed it off several times but does not seem to get any better. Do you know of any chemical which will destroy it? The spots are only five feet square, it would not take much chemicals to take it out. Do you know of anything to do away with the alkali? "Imperial".

If the alkali is the carbonate of soda, a liberal dose of gypsum will change it into a milder form, but will not remove it. The carbonate of soda will turn the ground brown or a very dark color. We know of no chemicals that will remove it unless it is what we suggest, but to entirely remove the stuff, it will be necessary to irrigate enough to wash it out of the soil. If you have but a few square feet of it, it would be quicker and cheaper for you to dig it out two or three feet deep and fill in with soil which you know is free from alkali.

TO REMOVE MOSS.

Editor Cultivator:—I would like to know of a spray that would take the moss from the trunk of prune trees. I have a prune orchard that has never been sprayed and the trunks of the trees are mostly covered with moss. So I would like to know if there is a spray of any kind that would remove the moss. A Subscriber, Gilroy.

Spray with lime sulphur and salt. It will improve the condition of your trees independent of the moss. This spray is made by boiling for one hour and a half, 20 pounds of best lime freshly slacked, with 20 pounds of the best sulphur. Then add 20 pounds more of freshly slacked lime and 15 pounds of stock salt and boil for half an hour longer. Make it up to 100 gallons and use while hot. This must be used only during the season when the trees are dormant. For a summer application you will have to confine yourself to whitewash which is not as effective as the above but is good.

SHIPPING ORANGES.

G. Harold Powell, the government expert sent here to study the causes of orange decay, met in an informal way a few packers and fruit men in the packing houses of the National Orange Company at Riverside last week. This was one of the series of little conferences at which Mr. Powell detailed some of the results of this season's experiments to the men vitally interested in this important work.

How important this work is may be inferred from Mr. Powell's opening statement that there was a loss by decay of five per cent on all oranges shipped from Southern California in 1905. The losses are caused by the blue mold which attacks the orange through a mechanical abrasion, or through a weakened skin. Numerous causes contribute to an abrased surface—clippers, gravel, brushing, and washing, etc.

That the growers and shippers are perfecting their methods is demonstrated, Mr. Powell said, by the fact that whereas the average amount of clipper cut fruit is five per cent this year, last year it was nineteen per cent.

The experimental work this year has been to test packing, fruit handled in different ways in the packing houses and shipped under pre-cooling, icing and ventilating. All of the experiments include brushed, unbrushed, washed and imperfect fruit.

Results of the season's experimental efforts were embodied in a series of charts which recorded to a mathematical nicety the results accomplished.

The first chart showed an average decay in forty to fifty packing house experiments in which the fruit was left in the house for two weeks in the sweat room. The chart indicated that there was but a trifling decay in the unbrushed fruit, four per cent decay in brushed, 12.5 per cent decay in the washed, and thirty-six per cent in the imperfect fruit. Mr. Powell argues that this experiment shows that the orange as it comes from the tree is a perfect fruit, and that the decay increases as the handling grows more complex. The fruit deteriorates by washing, due partially to the rubbing of the skin by brushes, the softening of the fruit and by the fact that the water is full of decay spores.

Another chart showed the result of twenty-five cars in an experiment to show the result of holding the fruit in the house different lengths of time after packing. The fruit shipped immediately developed two per cent decay, a delay of two days developed five per cent and five days, ten per cent.

Another chart showed the results of four cars delayed in hot weather. The chart indicated that there was practically no decay for the first day, but the decay gradually increased until the seventh day it reached 5.5 per cent in brushed fruit. The decay in washed fruit increased much more rapidly, reaching nine per cent on the fifth day.

Another chart indicated shipping experiments under ventilation, iced and pre-cooled. Under ventilation there was practically no decay in either unbrushed or brushed perfect fruit. The washed perfect fruit showed, however, a decay of 4.5 per cent, imperfect fruit, 17 per cent. This per cent was decreased in the iced fruit, which showed on its arrival the following decay: Unwashed, 0.1; brushed, 0.5; washed, 2.7; imperfect, 6. In the pre-cooled fruit there was no decay in the brushed or unbrushed, 0.5 in the washed, and 1.5 in the imperfect. The loss was four per cent when washed fruit was held in the house four days.

The coast region, mid-valley and upper valley regions were tested for the keeping qualities of their fruit, and there was found to be little difference in the keeping quality as the fruit comes from the tree. Ninety per cent of the fruit in the upper valley is not washed, while ninety per cent of the fruit in the coast region is washed.

The unbrushed fruit in the three regions has developed about one per cent decay; brushed from 3½ to 4½, and washed fruit about 12 per cent.

An experiment for decay with washed fruit showed decay of from two to nine per cent in the top of the car, and from one to five per cent in the bottom of the car, according to the number of days it was held in the house before shipping. Delayed imperfect fruit showed decay from ten to thirty-six per cent at the top, and from two to eleven per cent in the bottom of the car. There is little difference in the decay in different parts of the car in perfect brushed fruit.

Summarizing the results of the experiments, Mr. Powell said that sound, clean fruit was a fundamental for successful shipments. Fruit that is mechanically bruised, or fruit that has to be washed is most likely to decay. It should be shipped as quickly as possible after picking to prevent the starting of decay, and it should be as cool as possible when shipped.

A BIG DEMAND FOR A BIG TOOL

Mr. Killefer, manufacturer of the famous Killefer Cultivators and orchard working tools, informs us that his new Killefer Clean Cut Weeder is having an exceptional demand. One firm in Portland had ordered some $1200 worth of these tools, which shows how the farmers in that section appreciate this implement, and were so concerned during the recent earthquake at San Francisco as to wire down as to whether the Killefer shops in Los Angeles were still in line for manufacturing. This one firm expects in a short time to take a full car load of these implements.

This weeder has been a very great success in orchards, on beet, bean and grain lands. The one point which Mr. Killefer feels its strongest, excepting the effective work which it does, is the construction of the angle of the weed cutting knife. This particular feature has been patented and is such that it very much prolongs the life of the knife and gives the most effective service.

A. J. Petter, 109 Court street, Los Angeles, who advertises rupture absolutely corrected and makes a specialty of elastic stockings, shoulder braces, etc., is proprietor of the oldest establishment in Southern California and his reputation is good. A letter to him will be promptly answered and in many cases immediate relief can be given.

LONG AGO

"I once knew all the birds that came
And nested in our orchard trees,
For every flower I had a name—
My friends were woodchucks, toads, and bees;
I knew what thrived in yonder glen,
What plants would soothe a stone-bruised toe—
Oh, I was very learned then—
But that was very long ago.

"I knew the spot upon the hill
Where checkerberries could be found—
I knew the rushes near the mill,
Where pickerel lay that weighed a pound!
I knew the wood—the very tree
Where lived the poaching, saucy crow
And all the woods and crows knew me—
But that was very long ago.

"And pining for the joys of youth,
I tread the old familiar spot,
Only to learn this solemn truth:
I have forgotten, am forgot.
Yet here's this youngster at my knee
Knows all the things I used to know.
To think I once was wise as he—
But that was very long ago.

"I know 'tis folly to complain
Of whatsoe'er the fates decree.
Yet, were not wishes all in vain,
I tell you what my wish would be:
I'd wish to be a boy again,
Back with the friends I used to know.
For I was, oh, so happy then—
But that was very long ago."

—Eugene Field.

Promised

No kind fate intervened to warn her as he came into the room, quick and eager, and she went to meet him with outstretched hands and shining eyes.

"I am so glad for you," she said impulsively, giving him her hands. "Don't try to pretend that you are not proud of yourself, for of course you are. We bought every one of the evening papers and pored over them until I, for one, am positively overcome with awe when I consider 'that rising young architect, Richard C. Doane.'" And she swept him a low courtesy. "And fame sat lightly on his brow," she quoted, teasingly.

"But she isn't sitting there yet," he laughed, retaining the slender fingers and holding them tightly in his own. "This is only the beginning. There's plenty of hard work ahead."

"You are sure to succeed," she interrupted softly.

"I can only hope so," he returned. "I have worked hard for it and I feel that it is in line with my other work. Yes," he went on, thoughtfully, "I think we shall succeed."

"And then?" she asked.

His face was very bright and eager, and she found, to her consternation, that the color flooded her cheeks as her eyes met his. Embarrassed, she picked up a spray of apple blossom lying on the table. She walked over to the fireplace, drawing the pink and white petals nervously through her fingers. He followd her and stood with one arm resting on the mantel.

"I wonder," he said in a voice he tried in vain to steady, "if I dare to unfold the rest of my aspirations."

"Why not?" she replied; trying to speak easily. "You know I care very much for whatever concerns you." Under the circumstances this was about as unfortunate a remark as she could well have made.

Reassured, he came closer. "Like all well regulated aspirations," he said, with embarrassed hesitancy, "they are inspired by one governing idea"—He broke off abruptly, and, with a quick step toward her, took her hands in his. His embarrassment had gone and his eyes were very tender. "Surely you know, Catherine, sweetheart," he whispered unsteadily, "surely you know."

For a moment her heart seemed to stop, then with all her strength of will she pushed him from her. "No, no, Richard, I cannot," she whispered brokenly. "I have promised, I cannot."

"Promised what, sweetheart?" he asked, puzzled by this sudden change.

"You know, we have seen a great deal of Mr. Channing lately," she went on unsteadily. "He is often here and is always sending us things—books, games, flowers. Every day something comes either for mother or me. Usually for mother, though—so I never dreamed—he is so much older"—

"Today," she went on, a mournful little catch in her voice, "his man brought those." She nodded toward a curiously wrought bowl on the table, where, massed in sweet profusion, a wealth of apple blossoms overflowed, pink and white and fragrant with faint perfume. "And this." She walked to the desk and, picking up a note, held it out to him.

Mechanically he took it. "Dearest of all women," it began—and he read it to the end.

His face went suddenly white.

"Catherine, surely you will not marry this man?" he demanded hoarsely.

She covered hr face with her hands. "I have promised," she moaned.

"Promised! He doesn't even ask for your answer until tomorrow night."

"I have promised mother," she explained with gentle dignity. "There are business reasons I cannot explain. He was very kind three years ago when father died. We owe it to him to do anything we can."

"It is absurd! Quixotic! The man is three times your age," he returned hotly. Then his voice changed and he took the slender hands in his. "Surely you will not do this thing—let me talk to your mother," he pleaded gently.

"Mother must not know," she said. "Had you seen the distress in mother's face you would know I must do it," she continued. "Don't you understand?" she ended plaintively.

"No, I don't" he answered grimly, "but I do understand that John Channing is worth a couple of millions. Women are all alike," he went on, with sudden bitterness. "It's never what a man is, but what he has that tips the scale. Love cannot compete with Bradstreet. I've been the usual kind of a fool, I suppose,' he ended, with a bitter laugh.

If he had taken her in his arms, then and there, it would have ended differently, but he was very young and very proud, and very unhappy, and thought it was a manly thing not to show how much he cared. Or if she had let him see that he was dearer than any other man, millions or no millions, he would not have gone, but she, too, was young and proud.

So, hurt and angry, he had gone, and she stood where he had left her. She wanted him to go, of course, but it was hard to have him leave her like that. She sank into a chair and leaned her soft, bare arms on the table. The bright, fair head drooped slowly until it rested against them, and the fire light threw fitful, golden shadows on the white folds of her gown and quivered fantastically on the mass of fragrant blossoms over her bowed head.

* * * * * * *

The dance at the Ventor Country Club was in full swing. Lights were blazing; the sound of violins came through the open windows. Inside, the fifth dance was well under way, and a distracted, disheveled young man sought frantically for a tall, golden-haired girl in a thin, white gown.

Meanwhile the owner of the white gown and golden hair had slipped away—away from the lights and music and confusion—away from the vision of a stern, gray-haired man which had suddenly confronted her—and stood on the wide, moonlit porch outside, alone in the sweet-scented dusk.

"You are so silly to act like this," she argued with herself. "He isn't going to hurt you, is he? It doesn't help it any to stay out here and be a coward. Go back. You said you'd do it. Go back." Then she drew closer into the friendly shadows and laid her hot cheek against the cool leaves. "Richard, Richard, dear," she repeated softly.

Inside, the dance was ended. The music stopped with a crash; the dancers scattered in little groups, and the erstwhile distracted young man found evident consolation in the society of a plump little brunette, who showed no inclination to elude him.

Two persons who had been watching the dancers detached themselves from the crowd and came toward her along the moonlit porch; her mother, pretty, graceful, looking singularly young as the moonlight touched her flushed and—yes—laughing face. There was no doubt about John Channing's mirth; he was laughing heartily.

"He certainly said 'For Miss Page,'" "How could I know?" she heard her mother, smilingly, protest. And then, "He probably lost the card—my stupidity! Served me right for being

SURE SEAL,

Home canning of vegetables, meat and fruit made easy and certain by The Economy Jar

To give you an idea how easy it is to can fruits, soups, vegetables, meats, etc., in the Economy way—Note the wide mouth—how easy it is to put your hand in and thoroughly clean the jar. No rough seams inside or out to catch lint, chip into food or scratch you. After pouring the contents in hot and wiping rim of jar, clap on the gold-lacquered cap (acid-proof.) No screwing, twisting or prying. Just press the cap on gently. No bruises, burns, cuts or sprains when you use the Economy. Put clamp on top to hold cap in position while contents are cooling. The cooling forms a vacuum and holds cap on firmly. Jar is then absolutely airtight. Next day remove clamp, which lifts off lightly. If the food was cooked enough cap is held tight by vacuum, and contents cannot spoil, as no air can leak in. If cap loosens, contents were not cooked enough to sterilize, and can be heated again and saved. The Economy automatically informs you if contents are in proper condition to put away. When ready to use, puncture cap with can opener and pry off lightly. No sprained wrists, no unscrewing, no hands gashed by broken glass. No glass particles in food; no smelly top; contents fresh and sweet as the day you put them up. No separate rubber rings required. The Economy is the jar you will use with comfort and satisfaction year after year. There is absolutely no jar that looks like, works like, keeps like, seals like, or opens like the Economy. Using some other jar *cannot* give you any notion of what the Economy really is and what it really will do. Try the Economy for yourself. Ask your dealer for it. Send his name and we will send you, free, a booklet of recipes. Write direct to main office.

BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to

Hague Domestic Oil Burner Co, 810 So. Spring St., Los Angeles, Cal.

COLONIST RATES
TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00

Dallas, Houston and Fort Worth 25.00
Nearly all points in Kansas, Oklahoma and Indian Territory... 25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Santa Fe

afraid to speak," in John Channing's lower amused voice. As they neared the shadow in which Catherine stood, he turned and taking her mother's hand in his, lifted it to his lips. His stern face softened as she had not dreamed John Channing's face could soften, and there was a newly tender note in his voice. "As though," he said, "there could be any other woman in the world for me but you.'

Swiftly, noiselessly, Catherine turned and fled; around the club house, across the porch, down the steps, into the moonlit garden, conscious only of divine relief. Then as the absurdity of the thing came over her there came with it an uncontrollable desire to laugh. On and on she ran, struggling with subdued laughter, down the path, away from the lights and noise and people—and almost into the arms of a young man who turned sharply around a corner.

"I beg your pardon," he began politely, then stopped short, staring at the laughing face so near his own.

She held out her hands with a little cry of delight that gladdened his heart; to save her life she could not have spoken.

For a moment his eyes searched hers; then his face cleared as if by magic. He wasted no time in explanations, which could be deferred to a more appropriate season, but proceeded promptly to take the lovely, laughing vision in his arms.—Margaret Richards.

SOME SUGGESTIONS

Editor Cultivator:—You ask for suggestions to the Household department of the Cultivator. I will make a few which, while not wholly original with me, I think will interest some of your readers of this department:

It does not seem to be properly understood nowadays that the less babies are talked to and noticed during the first year or two of their lives the better. On the contrary, it appears fashionable to see how much the tiny infant can learn during its long-clothes stage. All success in training babies, indeed, depends on this calm, letting-alone principle. This leaves the nerves quiet and allows the little frame thus to become accustomed to the strain of acquaintance with this restless, big world of ours. When a child is quiet and amused never offer it another kind of amusement. There is also great wisdom, if one could only make people see it, in continuing this kind of neglect through youth. Nowadays people have an idea that their children will be backward and dull, if they are not excited to forwardness, but this is really not the case. Rest the poor brain while the child is small and it will mature properly.

Along this same line let me make a suggestion about criticising children. Pay just as little attention to their pecularities as is possible. Do not notice every little defect in their character, but keep a few principles in mind and try and insist on them, as for example, truthfulness, promptness and cleanliness. Good manners will be absorbed from parents without talking much about them for children are imitators and what older people do younger ones usually do also. Pay just as little attention to nervous children as you can, remember they are very apt to take on your own condition, and if you are strained to the point of breaking you send out just that electrical force which sensitive children take up. So it is far better to overlook the errors of childhood than to over-criticise and lead to others which may be worse.

We shall soon be getting the hot middle day hours. Here is a little receipt for keeping a room cool which I have tried and think it works well. The cheapest and simplest way to cool a room when the weather is oppressively hot is to wet a cloth of any size, the larger the better, and suspend it in the place you wish to cool. Let the room be well ventilated and the temperature will sink so much as twelve degrees in less than an hour.

Here is a suggestion about the use of cucumbers which will prove valuable I think also. People usually consider that cucumbers are not good for the digestion, and attribute to this really harmless vegetable ill effects which should be laid to salmon and other indigestible foods, with which it is usually eaten. Considering that cucumber consists almost entirely of water it cannot be anything but digestible. Provided that this vegetable is cut into very thin slices and masticated thoroughly, I do not think that the most delicate need to be afraid of it. Cucumber sandwiches made in the following way are very good: Cut the cucumber very thin and steep the slices for a while in oil and vinegar. Stamp out some rounds of thin bread and butter rounds and season with pepper and salt. Arrange in a circle in a dish and serve at once.

THE FOOT-PATH TO PEACE

To be glad of life because it gives you the chance to love and to work and play and to look up at the stars. To be satisfied with your possessions, but not contented with yourself until you have made the best of them. To despise nothing in the world except falsehood and meanness, and to fear nothing except cowardice. To be governed by your admirations rather than by your disgusts; to covet nothing that is your neighbor's except his kindness of heart and gentleness of manners. To think seldom of your enemies, often of your friends, and every day of Christ; and to spend as much time as you can, with body and with spirit, in God's out-of-doors. These are little guide-posts on the foot-path to peace.—Henry Van Dyke.

Hints for the Cook

CREAMED CABBAGE

To make a delicious dish of creamed cabbage take one head and chop fine. Boil until tender, then drain. Cook together one and one-half cupfuls of rich milk, two tablespoonfuls of butter, three tablespoonfuls of flour, pepper and salt. Pour over the hot cabbage and serve.

* * *

CHEESE SALAD.

Color neufchatel cheese slightly with green vegetable coloring and mould it into the forms of small eggs. Place lettuce leaves on individual plats to form small nests and put the moulded eggs in them. Sprinkle the eggs with pink sugar and serve with salad dressing.

* * *

BAKED ONIONS.

Select large, firm onions; wash clean and trim the ends, but do not peel; put into a saucepan, cover with slightly salted boiling water and boil rapidly for an hour, replenish with more boiling water if needed. Turn off the water and drain on a cloth, then wipe dry and wrap each in a piece of oiled paper or buttered tissue paper, arrange in a baking pan, place in a slow oven for one hour. Peel, put in a buttered ramekin, return to the oven and brown basting frequently with butter. Season with salt and pepper. Serve with drawn butter seasoned with a dash of nutmeg.

TRIBUTE TO PUMPKIN PIE.

An enthusiastic pie lover writes of the pumpkin pie: "Comely, brown and toothsome; in which are gathered the best and most seductive flavors of the season, the memories of summer in the fields, the rustling of corn, the fiddling of grasshoppers, and the scamper of squirrels between the furrows where the big globes lay ripening as the pomp of autumn passed and the Indian summer came and went. Each pumpkin's girth is filled with the zest of frosty nights under the hunter's moon, where it lay drawing the final and sweetest drops from earth's bosom. What an offense to kill these savors with overdoses of ginger, cloves and other unworthy spices! The pie may be 'faintly tinct with cinnamon,' and have a suspicion of nutmeg. And but a single crust, and that a lower one; for half the pleasure would be gone if the upper crust hid from view the pale yellow of the middle and the shading through the warm umbers to the ruddily browned edges."

From being a luxury a hot water bag has now become one of the necessaries of life.

Heat is so important a part of medication in almost all cases of sickness that this convenient method of applying it can be used at any time, and for any one, from infancy to old age. A little very hot water should be put into the bottle, so that the soft rubber can adapt itself to any part of the body, and not be a burdensome weight on the part affected. It may be wrapped in flannel or a soft towel if the touch of rubber to the skin is unpleasant.

Many of the sore throats and colds in the head come from a disordered stomach.

The remedy is, not only to use gargles to relieve the immediate distress, but to fast for from twelve to twenty-four hours. Take a laxative or cathartic which will clear out the system, when nature will resume regular work, as before she was abused, and the sore throat and cold will be a thing of the past.

Tools That "Count"

You can dig more ditch, hoe more corn, with a Keen Kutter shovel or hoe than with any other shovel or hoe made. No tools are so well adapted to their various uses as Keen Kutter tools.

Every stroke made with a Keen Kutter tool *counts*—there's no time lost from breakage or false motion. To accomplish the most—in the quickest way—at the least cost, use

KEEN KUTTER TOOLS

See this Keen Kutter Shovel—blade, socket and strap are rolled from a bar of best crucible steel, and oil tempered to give wear, resisting power and elasticity. This shovel has a perfect "hang" for easy handling and great working capacity.

San Francisco, Cal.

The Pomona Pump

The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

The Produce Markets

Los Angeles Markets.

Los Angeles, May 16, 1906.—The San Francisco disaster has resulted in the diversion of vast quantities of produce to this city, and the receipts are far in excess of a few weeks ago, or of a year ago this date. It has caused no great depression in prices, however, though some lines are slightly weakened.

Butter.

The produce Exchange lowered the price of butter—that is, of fancy coast—at its Wednesday session. It is assummed that the Butter Board of Trade may meet it at its meeting on Saturday, though it may not.

San Francisco Markets.

San Francisco, May 16, '06.

The local market is beginning to assume a normal condition, or at least more so than at any time since the disaster. Many small wooden structures have gone up in the market district and trading is becoming more regular.

The large number of men now emplayed in clearing away wreckage is increasing daily, which gives added demand to all food stuffs which the produce market is doing its best to supply.

Butter.

Dairy products have strengthened somewhat. The following are the ruling prices of the San Francisco Wholesale Dairy Produce Exchange:

BUTTER—Fresh California extras, 17c, steady; firsts, 16@16½c; seconds, 15c; packing stock, No. 2, 15½@16½c.

Cheese.

CHEESE—New California fancy, 11c; firsts, 10½c; Young American, fancy, 12c.

Eggs.

Eggs have increased a couple of cents in the past few days and are stronger in tone. Exchange quotations are:

EGGS—Fresh California selected, 17½c; firsts, 16@16½c; seconds, 15@15½c.

Poultry.

Poultry is too much of a luxury for the distressed city to think of as yet and no quotable prices are made.

Fresh Fruits.

Most of the leading fruits are now offered and find fairly ready sale at following quotations:

Strawberries, per chest, $4.50@6 for large varieties, and $6@8.50 for Longworths; apples, $1.50@2.25 per box; cherries, black varieties, 85@1.10 per drawer; white, 4@6c per pound; Gooseberries, 25@35c per drawer; oranges, navels, $2.25@3 per box, with a few second grade at $2 per box; lemons, $1.50@2.25 per box.

Vegetables.

Dealers are selling vegetables at the following prices: Asparagus, 75@$1.25 per box; green peas, 50@75c per sack; rhubarb, 50@60c per box for small and 70@85c for large; string beans, 5@7c per pound; tomatoes, 75@$1.25 per box; potatoes, new, 1@1¼c per pound; old, Rivers, 80@$1.10 per sack; Oregon, $1.10@1.30; Coos Bay, $1.30@1.40 per sack; onions, new, $1@1.25 per sack; boxes, 25@50c;

THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—*30 cents per foot and prepay the freight.*

Hay and Feed Stuffs

There arrived last week 2100 tons of hay. Part of this came by rail which was the first since the fire. The blockade of local freight will be soon cleared away and more normal conditions will prevail.

HAY—Per ton, choice wheat, $12 to $17.50; wheat and oat, $11 to $14.50; oat, $10 to $14; barley, $8.50 to $12; alfalfa, $11 to $12.50; stock, $7 to $7.50.

STRAW—Per bale, 40c to 60c.

BRAN—Per ton, $17.50 to $21.

MIDDLINGS—per ton, $25 to $28.

GROUND BARLEY—Per ton, $25 to $27.

Flour and Cereals.

FLOUR—Net cash: Family Extra, $4.70@5 per barrel; bakers extra, $4.40 @4.75 per barrel.

WHEAT—No. 1 Shipping, per cental, $1.27½@1.30; inferior grades, $1.18¾@1.25; white milling, good to choice, $1.32½@1.35; with fancy up to $1.40.

BARLEY—No. 1 feed, $1.20@1.23¾, with fancy up to $1.25; common to fair, $1.15@1.18¾; brewing, $1.23¾@1.26¼.

OATS—White, $1.50@1.75; red, $1.52½1.60; black, $1.30@1.40.

RYE—$1.47½@1.55 per cental.

CITRUS MARKETS

CITRUS MARKETS.

Los Angeles, May 16, '06.

The citrus market continues most satisfactory at all points. Auction fruit averages still cling around the $3 mark, though of course, some sales are for fancy prices.

Shipments aggregate about 100 cars per day from Southern California. Navels are nearly cleaned up, not much over 500 cars being left.

New York.

Offerings each auction day usually aggregate between twenty and thirty cars.

Friday's auction absorbed only eighteen cars. Weather favorable. Market firm. Some average quotations were:

NAVELS (Iced)—Red Globe, xc., Riv. Ex., $2.50; Our Pride, xf., Riv. Ex., $2.90; Sweetheart, fy., Riv. Ex., $3.55; Pointer, ch., A. C. G. Ex., $2.75; Floral, ch., S. B. Co. Fr. Ex., $2.80; Gabriella, fy., Indep. Fr. Co., $2.70; Partridge, xc., C.C.U., Ontario, $3.10; Peacock, xc., C.C.U., Pasadena, $2.35; Flower, fy., Upland District, $3.45; Quail, xc., O.-C. Ex., $3.20.

Sweets averaged 2.70 to 3.20; seedlings, 2.45 to 2.75; bloods, 2.60 to 3.35; grape fruit, 1.75 to 3.20.

Monday's auction took thirty-three cars. Market firm.

NAVELS (Iced).—Eagle, xc., Riv. Ex., $3.30; Quail, xc., O.-C. Ex., $3.30; Stag, xf., A.C.G. Ex., $3.30; Square, or., Riv. Ex., $3.35; Parrot, xc., San Antonio Ex., $3.05; Foothill, or., San Antonio Ex., $2.90; Squirrel, fy., A. H. F. Co., $2.85; Pet, xc., S. A. Ex., $2.80; Peacock, xc., C.C.U., Corona, $2.85; Oakmont, xc., C.C.U., Claremont, $2.85; Lion Head, xf., I. L. Lyon & Son, $3.25; Old Mission, ch., C. C. Chapman, $2.90.

Seedlings ranged from 1.60 to 2.70; grape fruit up to $3.25; lemons, 3.00; tangerines, halves, 1.20.

At Tuesday's auction twenty-five cars were sold.

NAVELS, (Iced)—Squirrel, fy., A. H. F. Co., $2.85; Holly, st., Cov. Ex., $2.90; Our Pride, xf., Riv. Ex., $3.00; Square, or., Riv. Ex., $3.40; Caballo, xc., S. A. Ex., $3.00; Quail, xc., O. C. Ex., $3.40; Gabriella, fy, Indep. F. Co., $2.70; Thistle, or, C. C. U. Pomona, $2.95; Lilac, ch, C. C. U. No. Pomona, $2.50; Partridge, xc., C. C. U., No. Pomona, $2.60.

Nineteen cars sold Tuesday.

NAVELS (Iced).—Hawk, ch., S. A. Ex., $2.20; Greyhound, ch., S. A. Ex., $2.65; Green Crown, st., A [illegible] Ex., $2.25; Red Shield, xc., A.C.G. Ex., $2.35; Jameson, fy., Q. C. Ex., $2.90; Ostrich, xf., S. B. Co. Fr. Ex., $2.85; Square, or., Riv. Ex., $3.15; Quail, xc., O.-C. Ex. $3.05; Partridge, xc., C. C. U., Ontario, $2.50; Peyton, st., Valentine Payton, $2.60; Producer, fy., Redl. Or. Prod., $2.90; Mispah, xf., Redl. Or. Prod., $3.00; Rose, xf., Redl. Or. Gro. Assn., $3.10.

Grape fruit, 1.95 to 4.15; bloods, 2.30 to 2.60; seedlings, 2.45 to 2.90; tangerines, halves, 1.10.

Boston.

Eighteen to twenty cars are sold daily at auction. On Friday eighteen cars were sold under favorable conditions.

NAVELS (Iced)—Jameson, ch., Queen Colony Ex., $2.50; Stork, xc., S. A. Ex., $2.75; Quail, xc., S. A. Ex., $2.75; Square, or., Riv. Ex., $3.00; Lochinvar, ch., R.-R. E., $3.20; Sunbeam, xf., Devine Frt. Co., $2.65; Victory, xc., C.C.U., Fullerton, $2.40; Peacock, xc., C.C.U., Corona, $2.65; Seal st., C.C.U., Corona, $2.55; Cosmos, xc., West Highl. Cit. A., $2.80; Clover, xc, R. O. G. Assn., $2.95; Rose, xf., R. O. G. Assn., $3.35; Tahoe, fy., R. G. O. A., $3.15; Iroquois, xc., R. G. O. A., $2.95.

Sweets sold at 1.35 to 2.80; Mikes at 2.65; bloods at 2.05 to 3.00.

Shipments of citrus fruits from California to May 15 amounted to 19,695 cars, of which 2045 were lemons.

Last year's shipments same date were 22,657, of which 1764 were lemons.

ORPHANS ECEIVED

South Pasadena, April 23, 1906.

The following named children have been admitted to the Boys and Girls' Aid Society of South Pasadena since last report:

Orphans—Charles Davis, Amer., 12 years of age, blue eyes and brown hair.

Half orphans—Albert Kujaneck, Ger., 13 years old, grey eyes, dark brown hair. Leroy Hunter, Amer., 7 years old, brown eyes, dark brown hair. Ida Marks, Port., 10 years old, brown eyes and brown hair. Marie Marks, Port., 8 years old, brown eyes and brown hair. Bently Stinhoff, Amer., 10 years old, blue eyes, light brown hair. Walter Higgins, Amer., 12 years old, blue eyes, light brown hair. Maud Hogan, Amer., 13 years old, blue eyes, brown hair. Geo. Mazet, Mex., 10 years old, black eyes, brown hair. Leonard Kujaneck, Ger., 12 years old, grey eyes, brown hair. Walter O'Brien, 7 years old, Amer., blue eyes, brown hair. Arthur O'Brien, 9 years old, Amer., blue eyes, brown hair. Joseph Gardner, Amer., 13 years old, blue eyes, black hair. Harry Gardner, Amer., 13 years old blue eyes, black hair Joseph Marks, Port., 5 years old, grey eyes, brown hair. Guy Frits, Amer., 8 years old, brown eyes, brown hair. Velma Frits, Amer., 6 years old, blue eyes, brown hair. Eva Dutra, Amer., 9 years old, brown eyes, black hair. Orris Mills, Amer., 7 years old, brown eyes, brown hair. Lucile Mills, Amer., 6 years old, blue eyes, golden hair. Frank Escamille, Mex., 6 years old, black eyes, black hair. Hazel Evans, Amer., 11 years old, blue eyes, brown hair. Leo. Rowan, Amer., 9 years old, black eyes, brown hair. Martin Friedell, Amer., 5 years old, blue eyes, brown hair. Sarah Carrillo, Mex., 12 years old, black eyes, black hair. Felisino Carrillo, Mex., 10 years old, black eyes, black hair. Marino Carrillo, Mex., 8 years old, black eyes, black hair. Tom Carrillo, Mex., 5 years old, black eyes, black hair. Ward Clarke, Amer., 8 years old, blue eyes, brown hair. Hartley Porter, Amer., 12 years old, blue eyes, brown hair.

OPIUM and Whiskey Habits cured at home without pain. Book of particulars sent FREE. B. M. Woolley, M.D., Atlanta, Ga., 103 N. Pryor St.

Ladies, send to Weinstock, Lubin & Co., Sacramento, for their free catalogue. It will cost nothing and you will have an opportunity of comparing prices with those you have been paying at local stores. The firm is one of the oldest, largest and most reliable on the Pacific Coast and they guarantee prompt and safe delivery as well as saving and satisfaction. Kindly mention you saw their announcement in the Cultivator.

Either for irrigation, drainage, or power, our readers will be interested in the distilate, oil and gasoline Giant Engines manufactured by Tarbox & McCutchan, Stockton, Calif. They are economic, light fuel consumers and repair bills merely nominal. The manufacturers wil be glad to furnish estimates on any kind of machines or works and a letter directed to them as per the above adress will bring a prompt reply. Their advertisement appears in this issue of the Cultivator.

The Western Gas Engine Company, Los Angeles, builders of engines and hoists, have opened branches in Oakland and San Francisco. Mr. J. F. Willard, formerly manager for Beck, Wakefield & Co., is in charge. They are located at Third and Washington streets, Oakland, and 547 Fulton street, San Francisco.

CERTIFICATE OF PARTNERSHIP.

State of California, County of Los Angeles, ss.

We, the undersigned, J. J. Steadman, H. A. Perkins and Frank Honeywell, do hereby certify that we are the persons transacting business in the State of California, at the City of Los Angeles, County of Los Angeles, under the firm name and style of the Cultivator Publishing Company; that the names in full of all the members of such copartnership are J. J. Steadman, H. A. Perkins and Frank Honeywell, and that the places of our respective residences are set opposite our respective names hereto subscribed.

Names.	Residences.
J. J. STEADMAN,	Hollywood, California.
H. A. PERKINS,	South Pasadena, California.
FRANK HONEYWELL,	1702 Hoover street, Los Angeles, California.

State of California, County of Los Angeles, ss:

On this 12th day of May, 1906, before me, H. E. Storrs, a notary public within and for said county and State, residing therein, duly commissioned and sworn, appeared J. J. Steadman and Frank Honeywell, known to me to be the persons described in and whose names are subscribed to the foregoing instrument, and each of them acknowledged to me that he executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal the day and year in this certificate first above written.

(Seal) H. E. STORRS,
Notary Public in and for said County of Los Angeles, State of California.

State of California, County of Los Angeles, ss:

On this 14th day of May, in the year of our Lord one thousand nine hundred and six, before me, H. E. Storrs, a Notary Public in and for said County of Los Angeles, State of California, residing therein, duly commissioned and sworn, personally appeared H. A. Perkins, known to me to be the person whose name is subscribed to the within and annexed instrument, and acknowledged to me that he executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal in said county, the day and year in this certificate first above written.

(Seal) H. E. STORRS,
Notary Public in and for Los Angeles County, State of California.

A Delightful Way to Go East

Is Via The

Scenic Salt Lake Route

Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City, thence ov r the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's

BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.

SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.

THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.

SALT LAKE ROUTE

THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.

DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.

EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.

EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:

May 25, 26 and 27—New Haven, Conn. Rate 92 10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50.
St. Paul and Minneapolis, $70 00. St. Louis, Memphis and New Orleans, $67.50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.

Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returning.

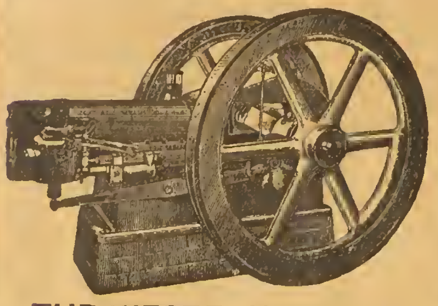
THE WESTERN GAS ENGINE

"From Factory Direct to User"



THE WESTERN ENGINE
Maximum Power at Minimum Cost

Designed and built by Western experts for Western use with Western fuel. In construction the Western embodies many original, yet practical ideas, which place it in advance of any other make on the market today. The simplest, strongest and best engine for

Irrigation, Power and Electric Plants.
Any Size from 5 to 500 H. P.

Burns cheapest fuel—gasoline, distillate or crude oil—with a saving of 20 to 40 per cent over any other style. **Send for Illustrated Catalogue** fully describing every detail of construction; tells **how** and **why** the Western excels all others; it gives the facts—the proof. Learn what Western engines are doing for others. Send your name today—ask for latest issue, A6.

U. S. Carbolic Insecticide

Trade Mark **TREE WASH** Registered

To grow fruit profitably must become a study with the grower, and to raise it successfully he must be constantly watching and guarding against the pests that attack both fruit trees and vines.

This insecticide requires no heating or boiling of water, but is used simply by diluting with cold water, assimilating perfectly, requiring no agitation, forms no sediment, no clogging of nozzles, and will not injure the hands in the least, but will, like carbolic acid, heal and cure sores if on them. It is cheaper than any other preparation or method, considering the results obtained.

The best fertilizer to the trees. The one that leaves them clean and healthy. The one that brings results and pleases. The easiest prepared for spraying.

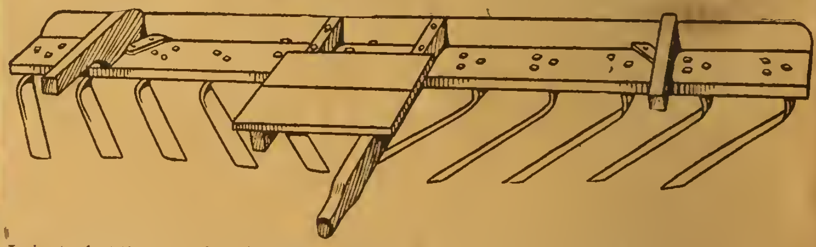
THE

Killefer Clean Cut Weeder



Is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. It does twice the work of any other tool with the same power. The knives overlap so it is impossible to miss any weed. Built in 6, 8, 10 and 12 foot sizes. The patented knives are so formed that they wear uniformly from heel to point, causing them to wear twice as long as any other blade for the same purpose. It is ***the*** tool for weed killing on any kind of cultivated land. Blades can be attached to cut in or out as desired.

LOS ANGELES MAY 25, 1906 SAN FRANCISCO

PERCHERON STALLION BARNUM 40139 (51951)

First prize stallion, three years old and under four, at the International Livestock Exposition, Chicago, 1904, and the Illinois State Fair, 1904. Imported and shown by Dunham Fletcher & Coleman, Wayne, Du Page County, Illinois.

The American farmer has undoubtedly a monopoly of raising draft horses. Only a few countries can produce them. We have imported the great bulk of the heavy draft stallions from England, Scotland, France and Belgium, and as we begin to mature our high-grade American draft horses we find the whole world eager to get them. America is the only country that can increase the supply for export to supply the world's markets, hence the prices must advance as the demand continues to increase beyond the supply of heavy draft horses.

CALIFORNIA GAME LAWS.

The penalty for shooting at, killing or having in possession any protected game during the closed season is $25 to $500 fine, and imprisonment.

Meadow larks, robins and all other species of song and non-game birds excepting only the linnet. English sparrow, the blue jay and the cooper, sharp-shinned and duck hawks) are protected at all times by State law, together with their nests and eggs.

There is no open season in California for swans, pheasants, bob-white and imported quail, female deer, fawn, antelope, elk or tree squirrels. It is a felony to kill an elk and the minimum fine for killing female deer, spotted fawns, antelope and mountain sheep is $50.

It is a misdemeanor to take or destroy the nest, eggs or young of any protected species of game or non-game bird.

It is a misdemeanor to trap or otherwise capture, or have in possession trapped or captured birds, without a permit first having been obtained from the State Fish and Game Commission.

It is a misdemeanor to buy, sell, give away or ship out of the State any quail, dove, robin, meadow lark or other wild bird, or the skin, nest or eggs of the same.

Watch the liner column in the Cultivator. Every line of business is represented from time to time and our readers will find it will pay them to look over it for articles they may wish to purchase and also it will pay them well to advertise therein anything they may wish to sell. If a ranch is for sale or rent, machinery not needed or to be replaced by larger plants, a fine cow or bull for sale, anything wanted or to be sold, can be advertised to good advantage and quickly disposed of. Try a liner ad.

HENS THAT HATCH FISH.

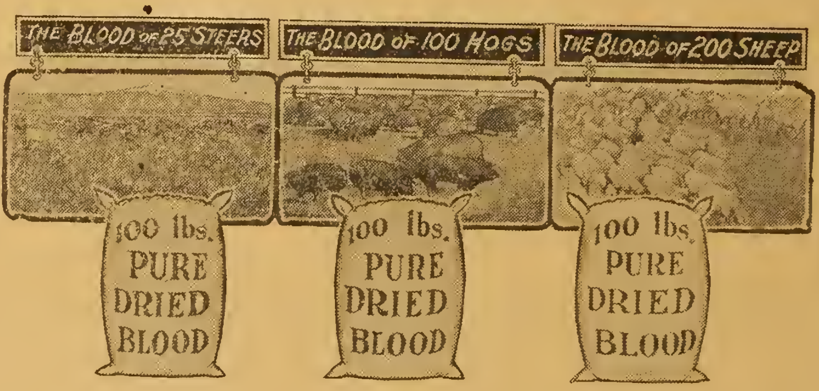
The Chinese are ahead of us in some phases of fish culture. They, for instance, can make hens hatch out fish. This is the way they do it: They take a hen's egg, withdraw its contents through a tiny hole, and substitute fish eggs. The opening in the shell is then closed and the egg is placed under a setting hen. The hen, suspecting nothing, welcomes the doctored egg, and in a few days the fish ova are so far advanced that the Chinese operator has only to break the shell in warm water and the little fish come to life at once. Some hens kick, hatching ducks, to see them take to the water. What must be the emotions of a Chinese hen when she hatches a lot of cold, wet fish?—Cincinnati Enquirer.

Real estate advertising appeals to home loving people and real estate agents are rapidly finding out that for country property either for sale or trade there is no medium better than the Cultivator. It reaches the special class who are interested in country homes as well as farms. Watch the liner column as well as the display announcements of large firms.

"Say!" demanded the ugly individual, suddenly appearing from a dark alley, "what time is it?"

"You're just about two minutes late," replied the Chicagoan. "That gentleman you see running away has my watch."—Catholic Standard and Times.

The Hearts and Blood of Half a Hundred Animals



THE BLOOD OF 25 STEERS
THE BLOOD OF 100 HOGS
THE BLOOD OF 200 SHEEP
100 lbs. PURE DRIED BLOOD
100 lbs. PURE DRIED BLOOD
100 lbs. PURE DRIED BLOOD

DID YOU KNOW?

It takes the blood of 20 steers, or the blood of 100 hogs, or of 200 sheep to make 100 pounds of pure dried Blood Meal. Therefore, pure dried Blood Meal is more valuable than people think it is. When you consider that it takes the blood from so many animals to make a single sack of dried Blood Meal, do you think you can buy pure, unadulterated Blood Meal for any such price as $3.00 per hundred pounds? Well, I guess not. If you get it for $4.25 per hundred pounds you are getting it cheap, and if you buy any grade of Blood Meal for a less price, you don't know what on earth you are getting.

THE BLOOD OF HALF HUNDRED ANIMALS

A pound of pure, dried Blood Meal is a more substantial food for flesh and egg making than any ten pounds of grain food, and yet, when you buy COULSON'S IMPROVED MASH EGG FOOD, you get a feed, a ton of which contains the cooked blood of HALF A HUNDRED ANIMALS, besides several hundred pounds of cooked Meat Meal, fresh ground Bone Meal, etc., all fine-ground into meal, and is so thoroughly mixed up by special mixing machinery with the richest grade of Middlings, Shorts, Cocoanut Meal, etc., so as to make a RICH, BALANCED RATION for making heavy egg-production.

NO WONDER THAT IT MAKES HENS LAY.

Is it any wonder that hens fed on this kind of feed will lay 200 eggs a year, or more? It's a mighty rich feed, and in order to assist the fowls to get the value from it, we mix a few ingredients with it, that will assist the digestion and assimilation of all the good things in the feed.

IGNORANT PEOPLE BUY CHEAP STUFF

Some poultrymen are using cheap Blood Meal that is adulterated with half tanbark (or other worthless material, of no use as food) which they could readily see if they only would know enough to LOOK at it.

And yet, they buy this cheap Blood Meal, and other fertilizer trash, and try to make Egg Food out of it, or mix up a feed of their own—and call themselves "SMART MEN." It's like a farmer trying to compete with a harvester, and who uses only a scythe and a rake.

When a poultryman buys COULSON'S IMPROVED MASH EGG FOOD, he gets a choice, rich feed, that contains GOOD, PURE, WHOLESOME INGREDIENTS that will do his hens good, and enable them to produce an abundance of eggs.

INTELLIGENT MEN, that's the kind that buy COULSON'S IMPROVED MASH EGG FOOD.

YOU LOSE MONEY ON UNHEALTHY HENS.

It pays to keep machinery in good order to prevent waste. It pays to keep your hens in order to prevent waste. Do you realize that a hen whose liver and working machinery is not in healthy condition, eats food which passes out of her without being half digested, just as whole grain would come through a dull mill, without being half ground?

GOOD FEED MAKES GOOD HENS.

It is on account of this waste that so many poultrymen remain poor; they do not realize that their fowls do not get two-thirds of the value of the feed. But when the hens are fed COULSON'S IMPROVED MASH EGG FOOD, they get ingredients mixed in the feed that put the hen's working organs in good condition, so that they can assimilate and digest the good materials that are in the feed, and make two eggs where they only made one before.

If anybody tells you that COULSON'S IMPROVED MASH EGG FOOD contains any trash, you can put it down, that either they have been MISINFORMED, or else, they are WILLFUL MISREPRESENTATIVES of the truth.

$300.00 FOR FEED—$900.00 WORTH OF EGGS.

During the past year (1905) Mr. J. Christensen, of San Luis Obispo, Cal., fed his flock of 300 laying hens on COULSON'S MASH EGG FOOD every day, and the total cost of all the feed used, during the year, was $300. He sold, during the year, $900.00 worth of eggs, making $600.00 profit.

5 WEEKS OLD CHICKS—3½ CENTS EACH.

Mr. Christensen hatched out 312 chicks, and fed them entirely on COULSON'S GROWING CHICK FOOD, dampened with a little milk.

He purchased 5 sacks of it, for which he paid $11.75. When the chicks were 5 weeks of age, he had 310 good, **strong, healthy chicks;** only two having died, and out of the 5 sacks of feed, he still had a bucketful left. So the cost of feeding them COULSON'S GROWING CHICK FOOD, up to 5 weeks of age, was about 3½ cents per chick, and raised 310 out of 312.

4 TO 4½ CENTS A MONTH TO FEED A HEN.

It costs 4½ cents a month to feed a hen COULSON'S IMPROVED MASH EGG FOOD, and it also costs 4½ cents a month to feed the cheaper feeds, as you have to feed so much more of them. By feeding COULSON'S IMPROVED MASH EGG FOOD, you will get the most eggs, not only now, but next July, and next October; and your hens produce for you, at least, $1.00 per year more profit than what they have ever done before.

ASK YOUR DEALER, or write to FACTORY.

1736 Berkeley Way,
Berkeley, Cal., April 3, 06.

Coulson Poultry & Stock Food Co.,
Petaluma, Cal.

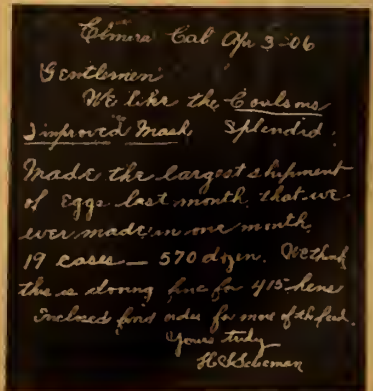
Gentlemen:—

I have been using your EGG FOOD for some two years, and will say that it has given me splendid results. My hens are in fine condition, and I can highly recommend the food.

Yours very truly,

(Signed) JOHN BARE.

P. S. We find the eggs from our hens are exceedingly fertile—from one lot of 200 eggs, I hatched 180 chicks.



Elmira Cal Apr 3-06

Gentlemen:

We like the Coulsons Improved Mash Splendid.

Made the largest shipment of Eggs last month that we ever made in one month, 19 cases — 570 dozen. We think that is doing fine for 415 hens

Enclosed find order for more of the feed.

Yours truly

H. S. Seleman

Grains Used for Cereal Breakfast Foods

By Charles D. Woods, D. Sc., Director Maine Agricultural Experiment Station, and Harry Snyder, B. S., Professor of Chemistry, College of Agriculture, University of Minnesota

There is no part of the world except the Arctic regions where cereals are not extensively cultivated. From the oats and rye of the north to the rice of the hot countries, grains of some kind are the staple foods.

An idea of the importance of cereal foods in the diet may be gathered from the following data, based upon the results obtained in dietary studies with a large number of American families. Vegetable foods, including flour, bread, and other cereal products, furnished 55 per cent of the total food, 39 per cent of the protein, 8 per cent of the fat, and 95 per cent of the carbohydrates of the diet. The amounts which cereal foods alone supplied were 22 per cent of the total food, 31 per cent of the protein, 7 per cent of the fat, and 55 per cent of the total carbohydrates—that is, about three-quarters of the vegetable protein, one-half of the carbohydrates, and seven-eighths of the vegetable fat were supplied by the cereals. Oat, rice, and wheat breakfast foods together furnished about 2 per cent of the total food and protein, 1 per cent of the total fat, and 4 per cent of the carbohydrates of the ordinary mixed diet, as shown by the statistics cited. These percentage values are not high in themselves, but it must be remembered that they represent large quantities when we consider the food consumed by a family in a year.

The reasons for such an extensive use of cereal foods are not hard to find. Besides being cheaply and easily grown, the grains contain unusually good proportions of the necessary food ingredients with a very small proportion of refuse. They are also readily prepared for the table and are palatable and digestible. Owing to their dryness they are compact and easily preserved without deterioration.

The grain as it grows on the stalk is surrounded by a hull or husk, which is so indigestible that it is removed before the seed is used for food. Each grain has an outer skin or bran layer, which may or may not be removed in milling. It is nearly always taken off from rice and buckwheat, sometimes from wheat, corn, and rye, and almost never from the other grains unless the outer sections are ground off as in pearled barley. Grains simply hulled or husked and slightly crushed are called groats or grits; more finely crushed they are termed meal, and when ground into a fine powder and sifted they are known as flour.

Grains in the raw state are not usually considered pleasant to the taste and are thought to be difficult of digestion, and therefore cereals are almost always cooked before eating. The simplest and doubtless the oldest way of cooking them was by parching. This was frequently all that was done to the oats which the Scotch Highlanders took as their only provision in their border forays, or to the corn the American Indians used for a similar purpose. But other ways of cooking make the grain more palatable, and it is usually mixed with water or other liquid and either baked as bread and cakes or boiled or steamed as pudding or porridge. It is the use of cereals as porridge that is of special interest, as cereal breakfast foods are most commonly used in America for porridge making or as a substitute for porridge. When used in this form they are perhaps not as convenient to eat as bread, do not keep so well, and require long cooking, but in spite of these disadvantages porridge is much used the world over, and grains have been thus cooked since earliest times. Many varieties of porridge are found. Sometimes the cereals are simply boiled in water, sometimes with milk, or with meat or kale, as in Scotch brose. Welsh budrum is made from oats which have been allowed to ferment and are then cooked, and the Arabs have a similar dish, kouskous, made from fermented wheat. In the old-fashioned bag pudding of England, of which Christmas plum puddings are the direct descendants, suet and fruit were mixed with wheat or barley and all steamed together in a bag. The simpler kinds of porridge are, however, the most common, and it is from them that modern breakfast foods have been developed.

Egyptian Corn, Growing in San Joaquin County.
Sometimes Used to Adulterate Cereal Breakfast Foods.

The number and variety of cereal breakfast foods at present on the market are large, but the majority of them fall readily into one of three groups. The first includes those which are prepared by simply grinding the grain, the second those which have been steamed or otherwise partially cooked and then ground or rolled, and the third those preparations which have been acted upon by malt, which induces a greater or less chemical change in the starch present.

No class of foods is more extensively or ingeniously advertised than the cereal breakfast foods. The claims sometimes made for them are astonishing. Some of them are said to contain several times as much nourishment as the same weight of beef; others are lauded as especially valuable as brain food or nerve tonics, and very many are claimed to be particularly well suited for persons of weak digestion. Many of these claims are obviously preposterous, others are doubtless true, and still others contain an ingenious mixture of fact and fancy. Realizing that accurate information in regard to breakfast foods was needed, investigators at several agricultural experiment stations have recently studied their composition and food value, and it is now possible to make a number of definite and reliable statements about them.

* * *

Grains Used.—The grains ordinarily used in the United States for this class of foods are corn, oats, rice, and wheat; less commonly, barley; and in some sections wild rice. In other parts of the world millet, rye, buckwheat, Kaffir corn, and other cereals are cooked into porridge, but with us they are too uncommon to warrant extended discussion.

Barley, which grows in almost any latitude, is more commonly eaten in Europe than in the United States, but less now than in former times. Its chief use in this country is for making malt, though pearled barley is frequently put into soups and a few barley breakfast foods are seen. Some of these last, however, are not made from barley alone, but from barley mixed with other grains.

Corn (maize) is a native American cereal, and although used extensively in Southern Europe and parts of the Orient, is still most widely used in this country. Since earliest times corn bread of various sorts, corn mush, and other corn dishes have been popular in the United States, the proportion of corn eaten being perhaps larger in the Southern States than in the North or West. There are many varieties of corn, differing in form, size, and color, but the average chemical composition in all cases is much the same. The germ of corn is relatively large and rich in fat, which tends to become rancid in keeping and is therefore sometimes removed in preparing the more popular meals. The names for the different corn products vary in different parts of the country. In some sections the whole kernels are called hominy and the partially crushed ones samp, while in others exactly the reverse is true. The old-fashioned hulled corn is sometimes called lye hominy. In making this the skin is loosened by steeping the kernels in a weak solution of lye, which gives a peculiar flavor to the product.

Oats are distinctively a cereal of northern regions, and wherever grown are an important porridge staple. In old-fashioned oatmeal much of the husk, which adheres closely to the grain, often remained in the meal. This seems now to have been largely remedied by improved methods of milling, though some tough particles of skin are still left in the finished product. Nevertheless, when thoroughly cooked, oats are a healthful food, the widespread use of which is well justified. The oat breakfast foods keep better than similar products made from wheat and corn.

Rice, as everyone knows, is a staple food in all tropical and sub-tropical regions and is much eaten elsewhere. The unhusked grain is usually called by the East Indian name of paddy. The husk and dark inner skin require special machinery to remove them. In the East new rice is considered inferior to old. All agree that it should not be eaten until three months after harvesting, and many consider it best after it is three years old.

Wheat is the most important breadstuff, and in the United States is also an important breakfast cereal. The old English dish, frumenty, made by boiling the husked grains with milk and spices, seems to be about the only one in which the grain is used

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

GIRDLING FRUIT TREES.

The Experiment Station Record relates how a number of eight year old apple trees were girdled as an experiment. The trees had never borne fruit and part of them were girdled and part left without the treatment. Both sets of trees bloomed full but soon after blossoming the ungirdled trees dropped their bloom and set little fruit. The reverse was true of the girdled trees. In one instance a girdled York tree produced nine and a half bushels of apples and an ungirdled tree alongside produced but one bushel. Attention is called to the necessity of observing carefully the healing process and see that the tree recovers properly. It is not stated how to overcome the difficulty in case the wound does not heal properly but we suppose that bridge grafting would have to be resorted to. This is done by taking new branches about the size of lead pencils, bevel both ends on the same side so that they will fit snugly down on the parts to be united by the bridge graft. Make a cross incision above and below the girdle so that the ends of the scion may be inserted and the ends of it run under the bark at each end at least three fourths of an inch. This may be done by bowing the scion in the center when inserting it. Bind the parts with waxed cloth. We give these instructions for the benefit of those who may wish to try the experiment, and over do it. Our advice would be to experiment on some trees of little value, some poor varieties, before trying trees that give promise of being choice. The removal of a ring not wider than one sixteenth of an inch and from that to one-fourth of an inch might be a good series of experiments. The behavior of the trees would give some key for future work. We would suggest that simply cutting around some branches without removing the bark would be a good experiment that would neither scar or permanently injure the tree. This might be repeated a number of times till the fruit is set, should the process have any such effect.

The article states that the fruit was much more highly colored on the girdled trees than on the others. Nothing is said about the quality of the fruit. It may prove to be of doubtful advantage as it is very likely that the quality of the apples would be impaired. We found this to be the case with an experiment with a peach tree on which we girdled a branch. The peaches on that branch ripened fully a week earlier than they did on the balance of the tree, were just as large, much finer in color but much inferior in quality. They lacked acid and were very insipid.

* * *

HIGH OR LOW PRUNED APPLE TREES.

An apple bulletin published by the Oregon station states that it has been discovered that in western Oregon, low pruned apple trees produce fruit of poor color while high pruned trees produce fruit of fair to high color. Here is an idea that may be of value to California growers. Has any one in the apple growing sections of this State noticed any such thing?

PHOSPHORIC ACID AND GRAPES.

The Experiment Station Record prints the result of an experiment made in France where certain amounts of superphosphoric acid were applied to wine grapes with the result that where 270 pounds of superphosphate were applied to a certain area, the wine made from the grapes contained ten times as much phosphoric acid as wine made from the same kind of grapes grown without any superphosphate. The experiment is valuable in showing that we might expect phosphoric acid to have a decided effect on fruit itself. This has been claimed for that element but unfortunately few conclusive demonstrations have been made to growers. This example is a very striking one.

ROOT PRUNING.

Editor Cultivator: In your "Queries Column" of May 4th on Orchard Pruning, you say that root pruning promotes the growth of fruit bearing wood. How should root pruning be done and at what time of the year?

I have quite a number of Bellefleur apple trees, twelve years old, the pictures of health, and every spring they seem to take on such a speedy growth that they throw off the fruit and grow wood and from all I can learn, these trees need root pruning. The gophers have never had a free run in my orchard and strange to say, one of the worst gopher infested orchards that I know of, invariably has a big crop of apples. I am inclined to give the gophers a clean run, only I haven't much faith in their knowledge of where to cut, so when would you cut the roots and how?—J. M. C., Lompoc.

While your trees are surely old enough to begin business, they are evidently laying a good foundation for heavy future crops, provided they were propagated from prolific stock. If such is the case they will no doubt make up for lost time. In the meantime, though, root pruning may be of value to you. In another column is an account of some experiments made with girdling apple branches which resulted in heavy crops. We think these experiments should be made on a small scale as no two sections can be counted on as giving parallel results. It may be that girdled tree or branches will produce prematurely ripened fruit which would be disastrous to winter varieties of apples, though desirable for summer sorts.

Root pruning should be done during winter time or in the spring when the plowing is done, and before pruning. Plow deeper than usual but not close enough to the trees to sever large roots. If you cannot reach a reasonable number of roots with the plow, run a subsoiler through the space distant between the trees, deep enough to cut a good many roots. Of course you understand that such operations are mostly guess work unless considerable digging is done, but results will finally give you a reliable guide. Try a couple of rows with the subsoiler crosswise. This will root prune that many trees on all four sides. We would like to have you report to us on the results obtained if you carry out this suggestion.

Fruit buyers are offering 9 cents for dried apricots around Hanford

DECIDUOUS FRUIT HIGHER THIS YEAR.

The rains which have occurred so plentifully during the past month have done a good deal of damage to fruit and the prices should be very much higher this year than last. In all the apricot growing section of the State north of the Tehachapi the trees had put forth green leaves prior to the first of March with no sign of bloom, although of course the bloom usually precedes the leaves. The apricot crop will not exceed one-fourth of a usual crop and reports are that prices of extra standard grades have advanced 20 cents a dozen as a result of the poor prospects for this year's crop. The weather in California last month has been an almost exact repetition of that in March, 1904, and it will be remembered that in that year the great Sacramento valley, where most of the peaches are grown, produced but one-tenth of a crop.

The pear blight will of course make a much shorter crop than that of last year for as yet no remedy for it or any agency for checking it has been discovered. In view of those facts the outlook for California canned goods the coming season, in my opinion, is discouraging, and it is too bad, for elsewhere in the country poor crops are promised. There will be no peach crop in Texas, and few if any peaches in Arkansas, Missouri and Kansas.

Jobbers throughout the middle west are carrying lighter stocks of California canned goods than for years, and stocks on the coast were never so closely cleaned up as at present. The entire country West of Pittsburg is buying more or less of spot fruits particularly apricots and peaches and the country was never in better shape to take hold of California canned fruits than it is now.—D., San Francisco.

FIGHTING CATERPILLARS.

A correspondent writing to the Pajaronian, describes his successful fight against caterpillars as follows:

"I procured ten gallons of crude oil, into a part of which I put about twenty, out of 300 pieces of burlap or barley sacking, cut about eight inches or so wide by about three feet in length, which, after lightly squeezing the superflous oil out of them, one by one, I put into an empty barley sack, for ease in carrying from tree to tree. (apricots.) I folded the pieces of sack in strips about three or four inches wide and tied them around the trunks of the trees. I watched the vain attempts of the pests to cross these bands of saturated cloth; watched them come in contact with the oil at the lower edge of the cloth; watched them raise their heads and bodies, tainted with oil, writhing back and forth, finally turning a complete somersault backward, falling to the ground either to perish or retreat. Thusly I saved all of my fruit at a very slight expense and at a great profit."

PROSPECTS FOR CROPS.

The prospects are good for large fruit shipments to the East during the season which has just opened. Fully 7000 cars of green fruit and grapes will be sent east of the Rocky Mountains before the season closes next fall. This volume of business will mean between $10,000,000 and $12,000,000 to the California orchardists.

The cherry crop throughout the State is splendid and shipments are now going forward rapidly. The peach pear, and apple crops promise large yield, particularly of apples and pears. Grapes give promise of a big yield. Apricots and plums do not promise well. What is lost by these will be more than made up, it is said, on pears, apples and grapes.

Bishop Joseph Wilmer of Louisiana and Bishop Richard Wilmer of Alabama, are cousins and intimate friends. In their travels in Italy one summer, the Bishop of Alabama was pointing out with enthusiasm certain architectural beauties. The Bishop of Louisiana was bored. He said: "It's all very fine, Cousin Dick, but, nevertheless, a rich field, fragrant with the odor of new-mown hay, would please me better." And the Bishop of Alabama replied: "Cousin Joe, there's not a donkey in all Italy that would not agree with you."

Dried Fruit Producers

CALIFORNIA AN IDEAL SECTION FOR QUEEN BREEDING

I am glad to see from an adverisement in the Cultivator, that we ave queen breeders in California. I ee no reason why California should ot be an ideal locality for such work. We have such an equable climate that here will be few or no shocks to weaken the bees, so we ought to get he very best results in our efforts to breed the best. It would also be posible to secure very early queens. The bees often get much honey from the orange bloom which opens in midwinter. Thus at this early season, the beekeepers could arrange not only to start his queens but to breed them. There is, and always will be, a demand for early queens. Thus California stands away in the lead as a most desirable section for queen breeding. It ought not to be difficult to find a section, possibly in the Imperial or Coachella valleys, where one could have entire control of all the bees, and so be able to regulate mating or selection of drones as well as queens.

* * *

MORE THOROUGH CULTURE

From what I have learned since I left California last summer I believe there has been far more cover crops grown in the orchards the past winter than ever before. In young orchards where water is plenty, this important work need not cease with the winter. I am sure that this practice will be attended with most satisfactory results. I hope that every one of our readers who is caring for a citrus orchard, will adopt the practice of deep cultivation at least on a small area and also of deepening the furrows in his irrigation so that the top soil is not made wet. I believe a little practice of this kind would soon convince any orchardist, and very likely through him, his neighbors, of the desirability of this better culture.

* * *

CITRUS FRUIT IN EUROPE

Citrus fruit, like honey, is not only very inferior as sold in the markets of Europe when judged by the California standard, but is sold at a high figure. I have just heard from letters received from home that there is more of the spirit of co-operation and combination among our California citrus growers than ever before. I hope this will be carried so far as to make a successful effort to market our fruits over the seas. I believe this is possible. California should sell immense quantities of fruit on this side of the big pond.

A FEW POINTS FOR BEGINNERS.

One without experience should not start in apiculture with more than five colonies of bees and the hives and implements necessary to handle them.

Buy your bees as close home as possible, providing you get them cheap enough.

Select colonies strong in bees, housed in a well constructed hive of standard size, the hive that is used largely by bee keepers in Europe and America is the Langstroth hive. It is recognized as a standard size and is used by nine-tenths of the bee keepers all over the world.

Make sure the combs are straight (crooked combs depreciate the value of a colony greatly.) See that they have sufficient honey to last until new honey is coming in.

They should have a good, vigorous queen and if they are blacks or hybrids it will pay you to get a good strain of Italians from a queen breeder.

The best time to buy bees is in the spring, about the time of fruit bloom, as then the colonies being light in weight are more readily moved.

Moving Bees.—After you have bought bees, the next important thing is to get them safely home. Bees may be moved any time of the year. During the fall or spring, when the days are cool, they can be moved with the least expense and trouble. It is always better to go about this carefully and correctly, as follows: Take off the hive cover; tack a wire cloth over the entire top of hive, and if the day is cool, stop up the entrance entirely, but if the day is warm, cover the entrance with wire cloth, close the entrance after dark so as to be sure the bees are in the hive. Next use an easy riding vehicle for hauling the bees, and drive so as to avoid any jerks or drops as a quick, hard jar is bad for the bee comb at any time or place.

After you get your bees home, put them into the place, which you should have prepared beforehand, and open the hive entrance at once, but provide yourself with a bee veil and blow a little smoke into the hive entrance. Do not have any horses or live stock near, as they are liable to get stung.

Location of Apiary.—Any place where there is an abundance of honey bearing plants, and which is not over stocked already, is suitable for the location of an apiary. A locality sheltered from high winds should be given the preference and if shade from a few fruit trees can be had, so much the better.

Face the bees to the south or southeast, if the surroundings allow it. Arrange a solid place for each hive to stand on, four or five inches from the ground. I use bricks for this purpose, but stakes driven into the ground and sawed off square, will do just as well, you can get especially constructed hive stands, but they are expensive.

Make sure each hive is level sideways, and a little lower in front to keep out water.

Keep grass and weeds down in front of hives.—M. D. Whitcher.

REMARKABLE HONEY CURE.

We find reported in the Schweizeische Bienenzeitung a case showing the efficacy and medicinal value of honey. A young woman was suffering from a very severe form of anaemia, and the eminent Dr. K—— at last told her that nothing more could be done for her, and that she could not live long, but without holding out much hope for her recovery, he recommended her to try honey and milk. She was to take this several times a day, and take walks in the woods, so long as she was strong enough to do so. She carried out his advice and in a few months became perfectly well and strong again. This is an example where honey has been the means of rescuing a life from the grave and should be an incentive to the more liberal use of honey as an article of food.

OBSERVATION HIVE.

A contemporary says: The queen bee is carefully watched, guarded and fed by a small band of workers, who are ever ready to administer to her wants. Another band of bees, called waxworkers, hang for hours in a long string, so to speak, while thus engaged. Still another band of bees shape and make cells, from the bright kinds of pollen brought in by the field workers. Other bees work with the honey, changing it about until it is in condition to cap over, ready for market. Other bees watch the temperature of the hive, guard and protect the entrance to the hive from the robber bees.

THE SWARMING SEASON.

Perhaps the most interesting season of the year for the bee keeper is the swarming season. Every wideawake bee keeper is anxious to increase his stock of bees by natural swarming. All beekeepers delight in the pleasing excitement of natural swarming—it is a most beautiful sight to witness a swarm of Italian bees as they emerge from the hive—their bright golden wings glistening in the rays of the noonday sun, making a picture never to be forgotten.

FASCINATING WORK.

To my mind, says a writer in an exchange, there is no occupation so interesting and enjoyable as that of bee keeping. Every school boy or girl should have a colony of bees to work with. In a few years they would not only become expert beekeepers, but make more than enough money to buy all their clothing. Parents should give the boy and girl a chance to earn their own living in this way. They would soon be on familiar terms with the bees and learn to handle them as easily and as safely as a pet canary bird.

She had been for a drive with a young man friend, and when she returned she was glowing with excitement.

"Oh, dear, mother," she cried. "Tom and I had the very narrowest escape from an awful accident! The horse very nearly bolted. We were going through Swan lane, when all of a sudden a pheasant got up from the hedge and frightened the horse, and if Tom hadn't made a dash for the reins"—

"Eh?" said her youngest brother, suddenly. "How's that? Why wasn't he holding them?"

And it took at least five minutes to explain.—London Tit-Bits.

As a rule the man who lives slowly lives long.

Citrus Fruit Transportation

Report of Investigations by C. Harold Powell

Riverside, Cal., May 17, 1906.

A summary of the principal points of the investigation of the causes of decay in oranges in shipment in 1906, by the Bureau of Plant Industry, U. S. Department of Agriculture.

The loss from decay in oranges in 1905 amounted to $1,000,000 or more. The decay is caused by a common mold which usually enters the fruit through an abrasion in the skin or else enters an orange that has had its resisting power weakened in some other manner. More than half the decay in the eastern markets can be readily traced to mechanical injuries in the skin of the fruit. Moist warm air provides ideal conditions for the growth of the decay. Cold air or dry air may prevent the germination of the mold spores and retard the growth of the disease if it has already started. It is unusual for decay to appear in a clean, sound orange even under adverse conditions.

The investigation in 1906 has covered the following field:

1. The mechanical injury in picking the fruit and the damage done by handling it in packing house.
2. The decay in sound unbrushed, brushed and washed fruit, and in fruit all of which has been injured by the clippers in picking, by stems puncturing other oranges or by abrasions of other kinds.
3. The decay in sound unbrushed, brushed and washed fruit in the coast, mid-valley and upper San Bernardino valley regions.
4. The decay in New York in sound unbrushed, brushed, washed, and in mechanically injured fruit shipped under ventilation, under icing, and under precooling. In the last method the fruit is cooled to 35 to 40 degrees Fahr., in a cold storage warehouse before shipping, and is then forwarded under icing.
5. The decay in New York in sound unbrushed, brushed, washed, and mechanically injured fruit delayed from one to seven days after packing in the packing house.
6. The distribution of decay in the car in unbrushed, brushed, washed, and in imperfect fruit when shipped to New York.

* * *

Clipper Cutting.—The average injury from cutting the orange with the clippers or shears in severing it from the tree has been about 5 to 8 per cent in 1906. In 1905 it averaged 15 to 20 per cent. The injury seems to be reduced to a minimum when the picking is done by trained gangs of men under the control of the packing house, or when the packing house employs an inspector to guard the different growers against this type of injury. The injury appears to be more common when the fruit is picked by the box and when the pickers are not under careful supervision. The oranges delivered to a packing house by different growers may vary from 1 to 40 per cent in the amount of clipper injury, and a similar variation is common in the fruit picked by different men in the same grove. In several of the largest interests in California this type of injury has averaged not over 2 per cent in 1906.

* * *

Stem Puncturing.—The average injury from stem puncturing has probably not been greatly reduced in 1906. This type of injury is the result of leaving the stem of the orange too long. It has averaged not over 2 to 3 per cent in large interests which have handled the fruit (with great care, but it often runs as high as 20 to 30 per cent. There is usually from 2 to 4 times as much stem puncturing in washed as in dry brushed fruit. Stem puncturing is caused most commonly in the grove in dropping the fruit into the picking bag, and in pouring it into the boxes. In the packing house it is increased by steep gravity runs, by the oranges dropping into the bins, by washing the fruit and by other forms of rough handling. It is most severe in packing houses with overhead, complicated machinery, and in all houses in which the machinery is run at a high rate of speed. There are other common forms of mechanical injury such as gravel punctures in the oranges in the bottom of the picking boxes, finger nail cuts and punctures and abrasions caused by incidental disorders in the packing house machinery.

* * *

Decay in Unbrushed, Brushed, Washed and Imperfect Fruit.—An average of a large number of tests made in all parts of the orange district with oranges held two weeks in warm, moist rooms, or under the most favorable conditions for decay, gives the following approximate results:

Unbrushed fruit apparently free from mechanical injuries, 1.5 per cent decay.

Brushed fruit apparently free from mechanical injuries, 4 per cent decay.

Washed fruit apparently free from mechanical injuries, 12 per cent decay.

Mechanically injured fruit (clipper cuts, punctures, etc.), 36 per cent decay.

The unbrushed fruit from the coast to the upper San Bernardino valley has averaged from 1 to 2 per cent decay in all places; the brushed fruit from 3.5 to 4.5 per cent, and the washed fruit from 11 to 12.5 per cent. Similar treatment in handling has produced similar results in all sections.

Shipping Tests. Ventilation—When shipped quickly after packing under ventilation to New York the decay in twenty cars of fruit forwarded from the last of February to the middle of April was as follows:

Unbrushed fruit apparently free from mechanical injuries, 1.5 per cent.

Brushed fruit apparently free from mechanical injuries, 1.5 per cent.

Washed fruit apparently free from mechanical injuries, 4.5 per cent.

Mechanically injured, 17 per cent.

Icing—When shipped quickly after packing under icing to New York (forwarded from March to May) the decay in about 35 cars of fruit has been as follows:

Unbrushed, apparently free from mechanical injuries, 0.1 per cent.

Brushed, apparently free from mechanical injuries, 0.5 per cent.

Washed, apparently free from mechanical injuries, 2.7 per cent.

Mechanically injured, 6 per cent.

Precooling—When shipped quickly after packing at a temperature of 35 to 40 degrees Fahr. and iced regularly in transit the oranges of all grades have arrived in New York practically sound. The decay in the imperfect and washed fruit has only been retarded under this method of shipment. The mold spores have not been killed. The fruit that would have rotted under ventilation or under icing is likely to decay as soon as it warms up. There is a double advantage in having clean, sound, unwashed fruit to ship. First, it carries well under all systems of shipping, and second, it is more likely to remain sound on arrival in the distant market.

* * *

Delayed Shipments—When brushed, washed and mechanically injured fruit has been held in the packing house, one, three, five and seven days after packing, and then shipped under icing to New York, the decay in all grades in ten cars was as follows:

Shipped the day of packing, 2 per cent.

Shipped three days after packing, 5 per cent.

Shipped five days after packing, 10.5 per cent.

Shipped seven days after packing, 11 per cent.

The delay in shipping affects the brushed, sound fruit least, and the mechanically injured fruit most, as may be seen from the following data taken from fruit shipped, under icing, from the same house in April:

Time of delay before shipping, 1 day: Brushed, 0 per cent; washed, 3.1 per cent; injured, 3.2 per cent; total, 6.3 per cent.

Time of delay before shipping, 3 days: Brushed, 2 per cent; washed, 3.3 per cent; injured, 4.3 per cent; total, 9.6 per cent.

Time of delay before shipping, 5 days: Brushed, 2.5 per cent; washed, 7 per cent; injured, 19 per cent; total, 28.5 per cent.

Time of delay before shipping, 7 days: Brushed, 5.4 per cent; washed, 7 per cent; injured, 19 per cent; total, 31.4 per cent.

In an iced car the decay is more serious in the fruit in the top tier of boxes, as the fruit cools more slowly than the oranges in the bottom tier of boxes. Sound brushed or unbrushed oranges appear to carry nearly equally well on both tiers. There may be two to four times as much decay in the top tier in washed fruit, and a still greater difference in oranges that are mechanically injured.

In precooled fruit the temperature of the car is more uniform from the top to the bottom. There is little difference in decay in the fruit in the two tiers of boxes. There is usually, though not always, a little more decay in the fruit in the top tier of boxes in cars shipped under ventilation as the air is warmer on the average in the top of the car.

These results, as far as they go, appear to indicate that the fundamental requirements for the successful shipment of the orange are that the fruit should be delivered to the packing house free from scale and free from mechanical injury, it should be handled in a packing house with enough care to prevent mechanical injury, and it should be shipped quickly after picking at the coolest practicable temperature. As conditions vary from these fundamentals the probability of loss from decay increases.

With the Citrus Growers

BY J. W. MILLS

ORANGE GROWERS ENEMIES

The troubles that have beset the orange growers of California since the industry has become of commercial importance, would have knocked the last vestage of life out of it had they all or even half of them come at one time. The contemplation of them is enough to make a small grower dizzy. Every once in a while some long fought foe seems to be on the decline but usually it keeps up its tantalizing efforts. The black scale that has caused so much expense seemed doomed at one or two periods but he has come out ahead in the struggle so far and how much longer he is going to keep it up is a matter of conjecture. It was with fond hopes that we looked upon the scutellista but he has proven a wise manager and always leaves enough scale running around to insure him a bountiful supply of good fat scales for the future seasons. At least that has been his record in the largest orange growing districts of California. The scutellista has been strongly intrenched in our scale infested orchards for two or three years, but as long as we have to fight the scale to keep our fruit clean, what good is he anyway? If he would only leave the scale alone, no doubt there would be some colonies of scale that would become so dense that an epidemic would break out and give us a new disease to inject into the rest of them. As it is, Mr. Scutellista keeps the scale thinned out and scattered just enough to keep them big and healthy.

We noticed last fall that fully 95 per cent of the black scale on some of the worst infested trees that we ever saw, had holes in the backs, made by the scutellista and still there were plenty of young scales scattered over the trees. We recently asked an entomologist of note, why this was so. He said that the scales are too healthy for the scutellista and produce more eggs than the larva can eat. So it seems that we have not yet solved the problem of cheap eradication of the black scale.

Now comes the question of which is the best, spraying or fumigation. This we cannot answer now but hope [illegible] a census on this at no distant time. Of course we will keep an eye open for some parasite that will get in and clean up after the scutellista or do the work without his help.

ABOUT BUDS.

We unfortunately did not get our copy in in time for the issue of the Cultivator for May 20th and the editor was compelled to use other matter which had one time been prepared by another writer on the subject of budding over old orange trees. This writer advocated using active buds from suckers where the bark on the trees to be budded is thick and heavy. Now I do not agree with this. In the first place a bud that grows on a well rounded fruit bearing branch has as much vitality as any bud. It may not start to grow as quick as a sucker bud that is just ready to burst open, but it will fill its place. The most important point though is that a bud from a fruit bearing branch is more desirable than one from a vegetative branch. The sucker that comes from an orange tree is more liable to produce sports than shoots coming from branches that are producing an established style of fruit. The reason perhaps is that the forced growth of the sucker offers a better chance for the accentuation of strong tendencies. Aside from any and all theories, it is better to propagate from what we have strong evidence as being good than to take from that which is uncertain to a greater degree.

* * *

NEW ORANGE PROBLEM.

Men who have been in the business of growing oranges almost from the beginning of the industry in this section, state that the growth this year, after the fruit colored in the fall, has been greater than ever before. Therefore it is probable that so marked an increase in the size of the fruit will not occur again in a number of years. But it is likely to occur, and it is pretty certain to prevail in some degree with increasing frequency.

This, then, has brought a new problem into the business. The early shipments of fruit have run too much to small sizes to command the highest prices. And, because of the very great growth this year after coloring, the late shipments have run too much to excessively large sizes to bring the best returns. This has led to a study of the problem with a view of overcoming this difficulty, if possible, and there seems to be but one practical way of doing it. This is by taking care in the early packing to remove only the largest fruit, leaving the smaller ones until later. The tendency has been with many who have shipped early to gather all the fruit as soon as it was sufficiently colored—if indeed they waited for it to color well—stripping the trees of the whole crop. If the fruit is to increase at all in size after coloring it would be far better to have the smaller sizes left for this enlarging process, thus avoiding off sizes at both ends of the season.—Redlands Facts.

FARMER AND NURSERYMAN.

The farmer is the nurseryman's best customer. Doubtless farming communities appropriate ninety per cent. of all the products of tree nurseries. Seventy-five per cent. at least, of this amount is literally wasted. Take the patronage of the farmers of our land off the list of customers, and our commercial nurseries could not long survive.

For this and other reasons the nurseryman should be especially interested in the farmer's attempts to make a profitable use of the trees and plants that have been placed in his care. When we take into account the immense amount of trees and plants that are annually dealt out to the farmers of our country by the commercial nurseries through their agents, and then we pass over and through our great State and note the absence of orchards of any comparative value, while many farms are totally destitute of what ought to be considered a necessity in the matter of fruit supplies for the family, such conditions not only call forth astonishment but also excite regret and pity in behalf of the planter and his family in the loss sustained and in the disappointment arising out of misdirected effort, as well as from the results of wanton negligence.

Smooth, Thin-Skinned, Solid, Juicy

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

oranges can be raised as easily as coarse, puffy fruit. The first step is the judicious selection of fertilizers.

The Goods Behind The Shield

enable you to avoid the necessity of experimenting with fertilizers. Their reliability has been demonstrated, both in the laboratory and the orchard.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

LIPPIA REPENS.

If you want something that will carpet the ground quickly, that will make a thick matting very pleasant to walk and roll upon, that will keep green winter and summer, and that will need very little watering to keep in good shape, plant Lippia repens. It is a trailing perennial, which does not die in patches, like some of the ice plants used on terraces do, but grows thicker and thicker, as it becomes older. It will not become a pest, like the Bermuda grass because it has no underground runners, but runs only on the surface of the ground; the rootlets that start from every joint go down perpendicularly, but have no reproductive buds themselves; consequently a spade inserted a few inches under the surface of the ground will take up the whole mass, if needed. It will do very well without mowing, as it will never grow over six inches high; but, if it is not much walked over, and if you want a very even surface, mowing and rolling will improve its looks.

A FINE TREE.

Mr. Geo. H. Rogers of Riverside sends us some kodak views, showing a symmetrical and very handsome pink crape myrtle, a beautiful shrub and extensively grown in Southern California. He says: "The symmettrical shape is obtained by trimming back in the winter months when dormant and it can be done severely if desired without any fear of injury, as it never dies back."

We have often recommended the more extensive use of this small tree, not only upon our residence grounds but to complete the street planting of palms and their fitting accompaniments. The tree is quite hardy and is grown in many eastern states, being a success everywhere.

SODDING TERRACES.

Upon terraces and banks where grass cannot be readily established from seed or by planting, with any success, the sod or turf is usually removed from some area where suitable grass is well established and used to cover the entire surface of the bank or terrace. A common method employed in this work is to cut the sod into pieces a foot square and about 2 or 2½ inches thick. This answer well upon small areas if the sod is cut to a uniform thickness and the surface of the ground is made very smooth; otherwise there is more or less difficulty in getting the squares of sod adjusted evenly so as to produce a smooth surface. Considerable ramming or pounding is necessary in order to establish the desired smoothness, unless great care is exercised in cutting the turf to a uniform thickness [illegible] viding a smooth surface [illegible] upon. After the strips of turf have been cut they are rolled into rolls of convenient size for handling and the sodding is accomplished by unrolling the turf over the area to be grassed. After placing the sod in position it is thoroughly rammed down with a heavy wooden maul or pressed down with a lawn roller in order to produce a uniform and smooth surface.

In arranging your garden, try to have it so there will be a succession of bloom.

THE WHISTLING TREE.

A species of acacia which grows very abundantly in Nubia and the Soudan is called the "whistling tree" by the natives. Its shoots are frequently distorted in shape by the agency of larvae of insects and so swollen into a globular bladder from one to two inches in diameter. After the insect has emerged from a circular hole in the side of this swelling the opening played upon by the wind becomes a musical instrument nearly equal in sound to a sweet-toned flute. The whistling tree is also found in the West Indian islands. In Barbadoes there is a valley filled with these trees, and when the trade winds blow across the island a constant, moaning, deep-toned whistle is heard from them, which in the still hours of the night has a very weird and unpleasant effect.

VITALITY OF TREES.

An illustration of the wonderful vitality and reproductiveness of the redwood is reported from Ukiah as existing in the forests of Mendocino county. It consists of the trunk of a red wood tree felled for the manufacture of shingles, which after lying on the ground undisturbed for several months sprouted a number of young trees, whose roots had developed in its own body.

Travelers through the coast forests have frequently observed the phenomenon of rows of well developed trees growing out of the bodies of those that have lain long enough on the earth to perish and decay. Some years ago a newspaper correspondent reported the strange phenomenon of new redwood growth on a bridge built of redwood logs across a Humboldt county stream.

The sides of this bridge consisted of two large redwoods which had been felled so that the ends rested in the soil on each bank. All along the upper side of each log a row of sturdy redwood saplings developed shortly after the bridge had been finished.

COOLNESS OF TREES.

It is not shade alone that makes it cooler under a tree in summer. The coolness of the tree itself helps, for its temperature is about forty-five degrees Fahrenheit at all times, as that of the human body is a fraction more than ninety eight degrees. So a clump of trees cools the air as a piece of ice cools the water in a pitcher. That is why the legislature has authorized the park authorities of New York City to plant trees in the tenement districts If the air can be made cooler and purer by the trees, fewer children will die of heat ailments.

THE COCOANUT.

The cocoanut tree is the most useful of all plants in the tropical region. Its seed furnishes food and an intoxicating drink. The shell gives drinking cups and vessels and a hard material capable of a high polish, from which personal ornaments may be manufactured. The trunk furnishes wood for dwellings and boats. The leaves make clothing, cordage, and ropes. The fibres of the bark and of the nut afford matting and carpets. The buds furnish a succulent vegetable, and from the trunk a palatable liquor is drawn by making an incision.

INDIA RUBBER TREE FRUIT.

The fruit of the India rubber tree is somewhat similar to that of the Ricinus communis, the castor oil plant, though somewhat larger. The seeds have a not disagreeable taste and yield a purplish oil. It is a fairly good substitute for linseed oil, though it dries less rapidly. Mixed with copal blue and turpentine, it makes a good varnish. The oil may be also used in the manufacture of soaps and lithographic inks. The seeds are somewhat like tiny chestnuts, although darker in color. The Indian girls are fond of wearing bracelets and necklets made of them.

THE CALIBAR BEAN.

The famous Calibar bean is said to be worse than strychnine. The natives use it for an ordeal. If a person is accused of a crime he is made to eat one, being adjudged to be guilty in case of death which is almost inevitable. Another seed employed for a like purpose is that of the ordeal tree of Madagascar, said to be the most deadly of vegetable products. One of these seeds about the size of an almond will kill twenty men.

HARDY ANNUALS.

Hardy annuals can be sown at any time and it will be a good plan to ask the seedsman when buying, as to the best varieties to sow at present. Sweet peas should be sown during the winter months, as they bloom much better and with larger flowers and better foliage, than if sown too late.

COMMON NAMES FOR PLANTS.

To many the names of some plants seem cumbersome and unpronounceable, and the question is frequently asked: What is the common name? A difficult question to answer in all cases, as the common name in the localities where they grow is sometimes more difficult to remember than most people imagine. Besides many plants are too rare to have received common English names.

OUR BEST CLIMBER.

Bougainvillea spectabilis var lateritia, known in plant circles simply as B. lateritia, is a great improvement in color over all other species and varieties yet introduced. The old well-known kinds are all some shade of magenta, while B. lateritia is an orange red and therefore matches almost any color of house paint, an effect almost impossible with magenta.

PEPPERMINT.

The preparation of peppermint is especially an American industry. The peppermint is cut when in bloom, like hay, dried, placed in close wooden vats and steamed. The oil cells burst and the oil passes upward with the steam, which is condensed and conducted into a receiver, where the oil rises and is piped off. It takes about 350 pounds of dry peppermint to produce one pound of oil. An acre of land yields from six to ten pounds of oil, often more, even as high as fifty pounds.

HONEYSUCKLE FOR BANKS.

Upon steep banks which are of a sandy nature, and under conditions where it is difficult to use sod, a pleasing appearance can be produced by the use of Japanese honeysuckle (Lonicera japonica). This plant is capable of establishing and maintaining itseslf under adverse conditions, and it makes a good soil binder and has the advantage of being evergreen.

HIS "CHARACTER."

There is story told of a Scotch gentleman who had to dismiss his gardener for dishonesty. For the sake of the man's wife and family, however, he gave him a "character," and framed it in this way: "I hereby certify that A. B. has been my gardener for over two years, and that during that time he got more out of the garden than any other man I ever employed."

"Spake full well in language quaint and olden,
One who dwelleth by the castled Rhine,
When he called the flowers so blue and golden
Stars which in earth's firmament do shine."

By measurement it has been proved that the flower stem of a century plant grows from six to twelve inches per day, according to soil, climate, etc.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—30 cents per foot and prepay the freight.

Wagner's Nursery Phones: Home, 1291; Sunset, 1297 Pasadena, Cal.

In the Vegetable Garden

BY ERNEST BRAUNTON

VALUE OF BEANS AND PEAS.

Fresh string beans, sugar peas, and shelled peas, like other fresh, succulent vegetables, contain considerable water, which, with the materials dissolved in it, forms the plant juice. They somewhat resemble cabbage in percentage composition. Fresh shelled beans, peas and cowpeas contain a fairly large amount of protein or nitrogenous material, the nutrient which serves to build and repair body tissue as well as to furnish energy. They also contain considerable carbohydrates and small amounts of fat, both these classes of nutrients serving to supply the body with energy. The amount of ash or mineral matter in the legumes varies in amount. It doubtless serves the same purpose in the body as mineral matter found in other food materials. The canned legumes, which are simply cooked foods sterilized and kept in such a way that they can not ferment, resemble in composition the same materials uncooked. The dried legumes contain some water, though to the eye they seem to be perfectly dry. They contain a high percentage of protein, in this respect surpassing the other seeds commonly used as food, such as wheat. They approach animal food as regards protein and total nutritive value, most of the legumes containing carbohydrates in place of the fat found in animal foods. Fats and carbohydrate, however, serve the same purpose in the body, although the fats yield two and one-forth times as much energy per pound as carbohydrates.

DIGESTIBILITY OF PEANUTS.

The peanut is remarkable among the legumes for its large proportion of fat (50 per cent) and its resemblance in taste and use to the true nuts. Long as the peanut has been cultivated in the South, it has never to any extent taken the place of a food, but remains a food accessory for occasional use only. No laboratory experiments seem to have been made on human beings as to the extent to which peanuts are digested, but according to general experience, the peanut eaten in any quantity is indigestible in the sense of bringing on pain and distress. This is probably on acount of their rich, concentrated character. It is to be noted that when they are eaten in connection with other food, as bread, the ill effects are less marked.

MUSHROOMS.

In cities and in the larger towns there is a growing number of persons who are able to recognize, with a fair degree of certainty, the plant which is usually understood to bear the name of "the mushroom," and which appears chiefly in pastures, and similar open places in fields.

This plant sometimes occurs in great abundance, and the eagerness with which it is sought by those who know its value as a food or relish, testifies to its importance as an article of diet.

If the worth of mushrooms as food was properly appreciated, even by the inhabitants of small villages and of the country, the ability to recognize several of the common species would not be difficult to acquire by those who would give an amount of attention to the subject equal to that which they bestow upon some other natural objects.

EGG PLANT.

Many people in California have never tasted this vegetable, let alone growing it. The egg plant is easily grown and a few plants, if in rich soil, will produce enough eggs for a family. They must not be started too early, as they are natives of the tropics, and therefore require rather warm weather. The fruit is fit for use from the time it is the size of a pear until it is fully grown. It is not as good when it indicates an appearance of ripening. The New York Improved Large Purple and the Black Pekin are two of the best varieties, and are offered by most seedsmen.

CHINESE WHITE CABBAGE

The Pe-Tsai (or "white cabbage") of the Chinese, is properly an annual plant, which has much the habit of a Giant Cos lettuce. It needs a moist and cool soil for its best development. If the plants are left too long in a seed-bed they tend to run to seed, and they do the same if set upon a hot and dry soil. The plant is nearly as hardy as the ordinary cabbage, and takes advantage of the cool weather of September to make its best leaf growth.

CHINESE BEAN.

This is a pole bean with few-seeded pods of great length and which are eaten after the manner of the pods of string beans. The same species, but commonly a shorter-podded variety, is sold by our seedsmen as French Yard-Long Bean. This bean is native to South America, and is widely cultivated in warm countries. It requires a long season, but we have little difficulty in securing pods twenty inches long. These pods are very slender, and somewhat flattened and ridged, and the beans are often placed two inches apart. The beans are like those of the French Yard-Long,—small and oblong (½ inch or less long), cinnamon-brown, with a white black-bordered eye.

VALUE OF BEAN AND PEAS

The green or immature pea and bean are among our most valuable green vegetables and fully deserve the place they now hold on our bill of fare. The value of the dried pea, bean, and lentil is such that one or more representatives are found in every country as a staple food, and they have been thus used from the earliest times. They are especially rich in protein, the nitrogenous constituent which forms the chief nutrient of meat, and are thus fitted to take the place of part of the meat in any dietary. Since in comparison with their value their price is low, they must be considered among vegetable foods as next in importance to bread.

As compared with the cereals the legumes are (1) less completely digested if eaten in considerable quantities; (2) it is improbable that they can be made into any form of palatable bread, and (3) their flavor is less generally liked, and on that account will not be made a regular daily food except by people who are forced to it by necessity. In view of their low cost and high nutritive value, however, they may profitably be used even to a greater extent than they are at present.

SEED SOWING.

Unless certain of the germinating power of seed, they should be tested before planted. It is very provoking and expensive to make elaborate preparation, and after careful planting find that they do not germinate when it is too late to secure another supply and plant again. If 100 seeds are counted and planted in a shallow box and kept in the proper temperature it is no difficult matter to ascertain to what extent they may be depended upon.

It is of the greatest importance to the gardener that the proper preparation of the soil be made for the reception of the seed. Manuring, plowing and harrowing should be through with before planting time. More failures result from improper planting than from inferior seed. The seed should be put in the ground when it is neither too dry nor too wet. An important operation in connection with seed sowing, and one often neglected, is the rolling or firming of the soil after the seed have been covered. The best implement for this purpose is a good hand roller, though the back of either a spade or hoe may be used, or it may be done with the foot. Seed thus firmed will often vegetate or appear above the ground two or four days earlier in very loose soil than those left loosely covered. Garden seeds sown in drills will almost invariably give better results than those sown broadcast, if properly thinned and cultivated. A good seed drill will save both seed and labor, and should be used when seed are to be sown in quantity. Drills may be procured that open, sow, cover and roll, and no market gardener can afford to be without one. The depth to which seed should be covered varies with the different classes of seed, the character of the soil, the quantity of moisture present, and the season of the year. In light sandy soils, seed require deeper covering than in stiff, heavy or clayey soils. The dryer the soil, the deeper they should be put in. They should be planted deeper in warm than in cool weather. The size of the seed to a great extent controls the depth of planting. If the soil is in perfect condition, the covering should be two or three times greater than the thickness of the seed, but deeper if in very light soil, and not so deep if in heavy.

THE TOAD.

Its great value to the pomologist and gardener has been fully established, on account of its destroying insects, especially those injurious to vegetation. We should, therefore, cultivate its friendship and assistance in the garden as well as that of birds. Every tidy housewife detests the cockroach and other vermin. Two or three domesticated toads will keep the coast clear of these. The toad is possessed of a timid or retiring nature, loving dark and shady places, but under kind treatment becomes quite tame. Many instances are cited of pet toads remaining several years in families and doing valuable service. All that is necessary to secure their co-operation indoor or out, is to provide them cool and safe retreats by day, convenient access to water, and they will go forth to the performances of their nocturnal duties without money and without price. In Europe toads are carried to the cities to market and are purchased by the horticulturists, who by their aid are enabled to keep in check the multiplication of the insect tribes which prey upon their fruits, etc. Nowhere will they prove more beneficial than in the vegetable garden.

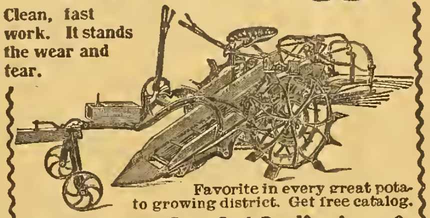
EARLY TOMATOES.

Plants grown from seeds from the first ripe fruit upon a given plant give poorer yields and no earlier fruits than other plants grown from a fruit from the same parent which ripens three months later, and it is probably safe to say that no gain is secured by selecting seeds from early or first ripe fruits without giving any attention to the character or habit of the plant as a whole.

The world deals good-naturedly with good-natured people.

Well DRILLING & PROSPECTING MACHINES.
Fastest drillers known. Great money earners!
LOOMIS MACHINE CO., TIFFIN, OHIO.

THE Hoover Digger
Clean, fast work. It stands the wear and tear.



Favorite in every great potato growing district. Get free catalog.
The Hoover-Prout Co., Lock Box 19, Avery, O.

Alfalfa and Fruit Land

To the Homeseeker. It will pay you to investigate our land in the Gridley Colonies, Butte, Co., California. We offer irrigated land as good as any in California at $50. to $100. per acre with a fully paid water right. Water costs only One Dollar per acre a year. We build the ditch to your land.

Anything that will grow in California can be produced on our land. Soil is a sedimentary loam. very deep and free from alkali. This is the land that grows the Big Oaks. No better land anywhere.

Alfalfa and Dairying, peaches, grapes, English Walnuts and figs pay the best Big fruit cannery, also a fruit drying plant at Gridley. New Electric Railway now building.

Good schools, churches, etc; good roads. A prosperous community, with a bright future.

Write for free printed matter.

Chas. F. O'Brien, Gen. Mgr.
30 Montgomery Street
San Francisco, Cal.

Malthoid is finished when laid and will last many years, resisting fire, overcoming the ravages of the elements and serving as a thoroughly water and weather proof roofing, Booklets free.

The Farmer's Occupation—All too many children born and reared upon the farm have instilled in them at an early age the idea that farm life is one to be sneered at, to escape from if possible, and that it is a ceaseless round of the meanest toil and drudgery without reasonable compensation. This is entirely the fault of the parents. Why not take the advice of James Whitcomb Riley and "sing a song o' cheer" instead of keeping up a continuous grumbling about the long hours, hard work, poor crops, distances from market and other drawbacks to rural life. Be the optimist. See the bright side of all things rather than the dark. "Sing a song o' cheer."

Such doleful utterances cannot fail to have a detrimental, depressing effect upon the receptive mind of the child. They quickly gather the idea that rural life is undesirable and distasteful, a something dreaded by all and borne only by those who cannot escape it. Many persons insist in seeing only the dark side of any life, but it really seems that this is more true of the rural population. It is a wonder that some farm boys and girls ever amount to anything so continually is it drummed into their ears that farm life is inferior to all others.

It is high time for country people to stop this nonsense and teach their own and other children to be proud of their comfortable rural homes, away from the noise, dirt, and turmoil of city life, away from the foul air and soot laden atmosphere, from street brawls and vice on every hand. Teach your boy that if he is honorable and upright, and knows how to farm and farm well, he is the equal of any man, and superior to most of them. Teach your girl that home life upon the farm can be made the sweetest and purest of all. Teach them both a reverence and love of nature in all her various departments and that only in the country may you live close to her, and with her, and above all, teach them the life above outlined by living it yourself.

* * *

Soil Destruction.—Our farmers are rapidly awakening to the importance of cover crops or green manuring, having become convinced that in past years they have been practicing soil destruction on a most extensive and ruinous scale. In the orchard sections particularly, both citrus and deciduous, this impoverishment has until recently known no abatement.

Orchards have been scratched and ploughed over with great destruction to the humic contents, and with little thought that herein lay the greatest source of danger. The small amount of commercial fertilizer and stable manure worked into the soil has in no single instance been sufficient to overcome the drain of crops and continuous cultivation.

Leguminous cover crops, aside from returning to the soil the most necessary and most expensive fertilizing element—nitrogen—improve the heavy soils in texture by becoming intermixed and mingled with the finer particles, thus gaining in tilth, aeration, etc., as well as in powers of reception and retention of moisture. More than this it prevents our soils, especially upon the hill-tops, from becoming "washed out." In too many orchards the crop productive powers of the soil have been transformed from the upper to the lower levels by this "washing out" process through failure to plow deeply to increase its storage capacity and also by keeping the land stirred during winter instead of planting a cover crop to hold the soil. The pursuance of such a suicidal policy will in time reduce our foothill orchards to a problem of how best to till the subsoil. There is no question but the preservation of the fertility of some of our best land lies in the intelligent, continuous use of cover crops.

* * *

Agricultural Education.—Sentimentalists are fond of echoing the cry of "back to the country" or of "harking back to nature," but what we should strive to overcome is the "harking" away from the country and nature. Our farm boys are educated away from the farm. How many fathers can say, as did a Riverside rancher of means, last week, "I point with pride to my son as one who, having received a splendid education, has not been lured from the soil by the glitter of city life."

The right kind of education will not wean them from a love of and interest in farm life. Too much stress cannot be laid on the importance of farmers giving their boys a good education along agricultural lines. A proper system of instruction will cause our farm boys to "hark" back to the old home as soon as their education is complete. They will be fitted to get, with one half the labor, double the results from the old place, as compared with those obtained by their fathers. An education is one gift you can give your boy that he can neither lose nor squander.

* * *

The Hepburn Rate Bill.—At the present time it looks extremely doubtful if we are to receive any benefit from the present congress in the matter of fixing transportation rates for agricultural products.

The principal feature of the original bill is to allow the Interstate Commerce Commission to fix rates of transportation. It directs said commission to investigate complaints and unreasonable charges by railroad companies in the transportation of persons or property, and to inquire as to whether the rates or practices "unjustly discriminate or are preferential or prejudicial, in violation of the act." They are further directed to prescribe what is just and reasonable, as a maximum rate, and in the practice of the corporations in dealing with the people.

As it came from the House, an order or finding of the commission could not be suspended, but remained in force pending litigation. This provision took away all inducement for the carriers to invoke the law's delays, and made it rather to their interests, if they had just cause for complaint against an order of the commission, to hasten the court's decision rather than to delay them. This brief statement shows what it was, and intended to be, when it received the unofficial approval of President Roosevelt.

The Allison amendment virtually defeats the original purposes of the measure if the latter should become a law. The amendment provides that any United States Circuit Court where the cases are heard may "enjoin, set aside, annul or suspend" the order of the Interstate Commerce Commission, pending the litigation which may be brought to vacate the order of the commission. Under this amendment the railroads would have it within their power to defeat the very objects for which the Interstate Commerce Commission was established. The commission can specify a rate, but cannot put it into operation, for the carriers, by appeal to any Circuit Court of competent jurisdiction, can have the new rate suspended until it shall have run its course through the courts. The Allison amendment provides for court review first. This leaves the shippers practically where they now stand.

The bill will now go back to the House. That body, as a matter of course, will refuse to accept the confusing and emasculating amendments of the Senate, and the result will be a conference, through committees appointed by both Houses respectively and undoubtedly there will be a determined struggle in conference. The Senate and the House conferees will doubtless find themselves far apart. If they reach an agreement, through mutual concessions, each house of Congress will have to ratify the agreement in order to make it binding, and the President's signature will be necessary to complete its enactment into law.

With all this weakening by "ten pages of amendments" there is still some good left in the bill if it passes as at present constituted. One amendment which is most commendable, makes pipe lines common carriers and amenable to the provisions of the bill. The imprisonment clause and the anti-pass amendment are further wholesome provisions, and for these we should feel thankful, but in all that California farmer is deeply interested, the bill is practically emasculated by the Allison amendment. When the matter is sifted to the bottom it looks as though an Interstate Commerce Commission was a superfluity. The United States Senate has, of late years, been considered so unrepresentative of the people, that little was expected of it in relation to relief from exhorbitant rates of transportation and therefore our disappointment is not great. It is sincerely to be hoped that joint conferences will result in weeding out many of the most vicious and unjust amendments, and that in the end the people will receive a decided and much needed reduction in rates.

* * *

Our Seed Industry.—The past few years have demonstrated, beyond a doubt, that California is destined to be the largest seed growing section in the world. At one time it was thought that in the Santa Clara valley alone could be grown certain seeds superior to those from any part of the world and while this favored section still leads, there are many portions of Central and Southern California that have made an enviable reputation in this respect.

For several years past nearly all the seed farming has been confined to the Santa Clara, Sacramento and San Joaquin valleys. Nearly 4000 acres are grown in Santa Clara county alone. Abundance of water, level land, good soil and climatic conditions, with low priced acreage has built up for this county this now world-renowned industry. The same is largely true of the two other valleys mentioned. However, there are some crops of seed of such remarkable value that price of land is of little importance, in fact, no other crop in the world will bring larger returns per acre than certain rare flower seeds, and many growers of these are situated south of the Tehachepi. Every year sees an increase in the acreage devoted to seed growing in all parts of the state, so that in time this industry is destined to become one of paramount importance to our whole people. Already the reputation of California-grown seeds is world-wide and our seed fields have reached vast proportions, giving steady employment to nearly 5000 persons. A long dry summer and an almost continuous season are the peculiar conditions which have placed our state well in the lead. Just at present a trip through the principal seed growing sections by rail presents a gorgeous and ever changing panorama of color, while all about the air is laden with the most bewitching perfume.

* * *

Roads In Oregon.—In 1904 there were 34,258 miles of public roads in the State of Oregon, of which 2,235 miles were surfaced with gravel, 209 miles with stone, and 145 miles with plank, making a total of 2,589 miles of improved road. It will be seen from these figures that about 7½ per cent of the roads have been improved. By comparing the total road mileage with the area of the State, it appears that there was about thirty-six hundredths of a mile of public road per square mile of area. A comparison of mileage with population shows that there was 1 mile of road to every 12 inhabitants, but only 1 mile of improved road to every 159 inhabitants.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE

Portersville is getting ready for its citrus fair.

Pomona is to have a new marmalade factory.

Ontario reports about 200 cars of oranges yet to be shipped.

Corona has under way definite plans for extensive street tree planting.

Brawley has been shipping new onions by the carload for several days.

Sonoma county expects an unusually large crop of apples and cherries.

The "June drop" of peaches is reported as very bad in San Joaquin county.

The grain around Escondido is reported as looking well, but some smut is making its appearance on the oats.

Highlands is to have an orange cider plant that will be extensive enough to care for thousands of boxes of cull oranges.

Owing to the unusually wet winter, some almond trees in Central California have perished from an excess of water.

The recent rain around Marysville is said by orchardists to have done little or no damage to cherries or other fruits.

The Mountain View Fruit Exchange will rebuild their packing house, which was made by the earthquake simply a pile of bricks.

The San Pasqual apricot growers have sold their entire crop for the coming season to northern buyers for eight cents per pound dried.

Grapes will be grapes in California for some time to come. Practically all the wine that was stored in San Francisco has been destroyed.

Every fruit packing house in San Diego county is running to its full capacity, and the quality of fruit being handled has never been better.

The first shipment of Valencia oranges was made from Lindsay last Wednesday when the Lindsay Fruit Association sent out three cars.

All fruit trees around Ukiah except peaches are loaded. The Bartlett pear crop will be the largest in five years unless something unusual happens.

The apple growers of the mountain sections of San Diego county are feeling good over the bright prospects for a record breaking crop this year.

It is estimated that California will this season ship to other states 7000 carloads of fresh fruits, and that they will bring from ten to twelve million dollars.

The hill lands of the Bixby ranch near Los Angeles are to be converted into extensive forests of eucalyptus for the purpose of raising timber for posts and lumber.

Solano County reports grape outlook "splendid," cherries from half to full crop, peaches 60 to 75 per cent, plums 40 to 75 per cent, prunes 60 per cent and pears as full as last year.

The walnut trees come out in leaf better this year, in Orange County, than for several seasons past, and the nuts seem to be setting well for an average crop. Apricots will be a light crop.

The Fresno Home Packing Company have purchased the Balfour-Guthrie warehouse in Dinuba and will equip it for a raisin and dred fruit packing house in season to handle the crop of 1906.

It seems to be the general opinion around Campbell that the coming prune crop will not be over a half of the average crop. Apricots are extremely scarce, cherries light, but peaches are a good crop.

P. W. Morse, Watsonville, has just received a beautiful gold medal, containing about $75 in gold, the same having been won by his firm at the World's Fair at St. Louis two year ago for the best display of apples.

Fruit shipments in carload lots for 1906 commenced from Vacaville Thursday, May 17th. A peculiar feature in this connection is the fact that this is the same date on which the first carload left by freight last year.

The fruit crop promises well in the Santa Clara Valley with the exception of apricots. Prunes will yield about twice that of last year: peaches are fairly full, cherries generally are a little light, but not so much so as last year. Apples and pears promise well.

The announcement is given out by the California Northwest Railway that Sunday, May 20th, will be "Wild Flower Day," and a bouquet of wild flowers will be handed to every passenger on the south bound trains. "Poppy" and "Rose" days will be observed later on.

Packers estimate that a normal crop of prunes in the Santa Clara valley is 110,000,000 pounds. Last year the crop was only 35,000,000 pounds, and the year before that 70,000,000. For that reason the price this season should be good. We have had two short crops and the market is cleaned out.

With the exception of a few cars of Valencias, sweets and seedlings, the orange season for the year 1905-1906 in the Redlands region, is ended and shipment of cars from the district including Highland, East Highlands, West Highlands and Del Rosa, is 1254 cars, as against 1800 for last season.

AGRICULTURE.

Corona now has a healthy farmers' club.

The overflow from Tulare lake has destroyed a vast acreage of crops.

Arrivals of hay at San Francisco during last week were 2100 tons.

Brawley expects to ship 200 cars of canteloupes during the present season.

Nine and one-half cents is the best price offered for hops around Santa Rosa.

This season promises to be a good one for potatoes throughout Ventura County.

All sections south of the Tehachepi report a splendid outlook for general farm crops.

The Anchor cheese factory at Compton is turning out about a ton of cheese daily.

Orosi reports promise of a large yield of both wheat and barley, and the hay crop is heavy.

Beekeepers about Lompoc say present conditions warrant expectation of a poor harvest of honey.

The freight shipments from Escondido last week were, three cars of hay, two cars of lemons, and one of grain.

The beet acreage around Chino has geen somewhat enlarged since our last report, and the crop is looking well.

Many parts of California are jubilant over the late rains, which in many places has been of great benefit to crops.

It is reported that one of the Ukiah growers has engaged his hops for 9½ cents for two years and 10 cents for the third.

All along the central coast portion and the San Joaquin and Sacramento valleys grain and hay crops will both be excellent.

California farmers are making a united effort to secure grain sacks from China, as our own supply is extremely short.

Hop growers around Ukiah report the vines are well up and an even stand. Prospects so far are good for the largest crop in years.

Alfalfa cuttings around Cornng have run as high as three tons to the acre for this season's first cutting. How's that for non-irrigated land?

Farmers of the Imperial Valley are complaining that they cannot procure enough help to harvest the immense crops now demanding attention.

The cantaloupe growers of the Imperial Valley claim they will need one thousand men for several months in order to care for the crop, which will be large.

The rain in Mendocino County Monday was a great help to everything, especially the second crop of alfalfa, and did not damage what hay was down.

Newton B. Pierce, United States government pathologist for the Pacific coast, has received notice from Washington, D. C., ordering the station at Santa Ana to be closed.

The heavy rainfall of the present season, with rains down to the past week have insured unusual crops in some sections and caused but very slight damage to anything.

An abundance of rain has fallen in the Monterey section this season and good crops are assured. Farmers report that they will have the best grain crops they have had in years.

The farmers around Compton are busy harvesting a large crop of hay. Worms are doing considerable damage to alfalfa. Hot weather is earnestly wished for to put an end to these pests.

The express shipments from Escondido for last week were 4,590 dozen eggs, 2,238 pounds chickens, 3.030 pounds cream, 2,265 pounds of butter, 3.240 pounds of vegetables, and 1.485 pounds of meat.

The total rainfall at Healdsburg for this season is 46.36 inches. At the corresponding date last year the record was 51.37 inches. Frost was reported on Tuesday though no damage was done to crops.

One of the hardest rain storms of the season struck Lindsa-- last Friday afternoon. The water came down in torrents and in half an hour the streets were flooded, but farmers say no harm will result to crops.

The gratifying intelligence has come that the famous Stanford Ranch at Vina may soon be offered for sale in small tracts in order that Stanford Unversity may repair the damage wrought by the recent earth tremblors.

Farmers throughout the Santa Maria section are jubilant over excellent prospects for large crops of grain and hay. Neighboring valleys will have large yields and it appears that those crops will be among the heaviest ever harvested in this State.

LIVE STOCK.

The creamery at Watsonville is shipping butter to Los Angeles for the first time.

About 1200 bales of the spring clip of wool were sold at Red Bluff at prices ranging from 21 to 24 cents a pound.

Thirty cowboys are rounding up the cattle about Redding preparatory to driving them to the mountains for the summer.

On May 19 Fish and Game Warden C. A. Reed with a force of assistants began the distribution of 1,250,000 trout in the streams of Santa Cruz County.

The Wool Growers' Association in session at Marysville, cut its spring sale short at noon May 8th by issuing a statement that the sale would be continued on June 8th.

More than twenty thousand head of sheep and lambs have been shipped from Tehama County during the past fortnight and the total for the season runs away up into the thousands.

The Marysville Wool Growers' Association closed its spring sale last Saturday without disposing of much spring clip. Prices ruled about 22 cents, and growers wanted 25 or better.

The San Luis Rey Creamery reports a supply of 987,881 pounds of milk for the year from 260 cows, from which $14,971.66 was received. This produces a gross income of $57.50 per cow.

E. A. McDonald, Dairy Inspector, U. S. Department of Agriculture, whose headquarters are at Seattle, was rummaging the southern end of the state during the past week for statistics for a bulletin to be entitled "Dairying on the Pacific Coast."

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

FOR SALE—A FEW THOUSAND BLUE Gums, cheap to close out, Address L. Z. Huntington, Anaheim, Cal.

WANTED—WILD TURKEYS EGGS AT $100 00 per setting. Address only The Grace Glory Grounds, Brawley, Calififoruia. Wilds of wild Turkeys (acclimated).

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

FRUIT CANNING MACHINERY FOR THE Ranch or Factory, 6sizes, $10 to $225. All appliances, highest award by U. S. Trades Report. Address, W. S. Ritchie, Pacific Coast General Agent, Corona, Cal.

FOR SALE—OR EXCHANGE FOR TOWN or rauch near Los Angeles or north inland from coast, poultry and fruit ranch of 33 acres, shipping canning and drying fruits. All nnder cultivation and good improvements. Two hours' ride from San Francisco by cars, one mile from town. Address Box 64, Sonoma, Cal.

FOR SALE—WHITE MINORCAS EGGS $1.50 sitting from one of the nicest pens of Wh. Minorcas in Southern California. Lay the most eggs and the largest-whitest eggs of any breed. Call and see them at 547 W 54 St., or address 1004 E. 9th St. Also incubator chicks for sale.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

INTELLIGENT FEEDING.

The error most common in the San Joaquin Valley is mixing up the breeds, for instance, I am constantly in receipt of letters asking for a good bull to use on a good Jersey or Durham herd. I always reply, "don't mix your breeds if you are thoroughly satisfied that some other breed is better adapted to your conditions begin again, with common cows, or exchange or sell your grades, and buy grades of the breed you wish, but do not think that you can take either a Durham or Holstein grade for large milk production and by using a Jersey sire make their milk five or six per cent. butter fat, or take the little Jerseys and use a Holstein sire, and make them give you six, seven or eight gallons of milk. It is useless to try this, as to think that a Chinaman will make a good American citizen. Intelligent feeding and gentle handling are necessary to make cows do their best at the milk pail.

If a cow weighs 1000 pounds she needs, to keep her alive without giving milk or carrying a calf, 25 pounds of hay. Now calculate; if the cow lives on say 25 pounds of hay, increase this to 35 pounds and she must put extra fat enough into the pail to pay for the first twenty-five pounds, as well as the labor and the last ten pounds. Now, the thing is to find at what point to stop increasing the quantity and turn to increase the quality of the ration, for the nutriment can be doubled within a given quantity of milk. The fine point of feeding cows for record is to give this food palability and vary it so as not to clog the appetite.

The balanced ration of the cow stable has lately been considered by some people to be a delusion, but, until they can suggest some good explanation of the result attained by its use over a long extended term, we must abide by it, rather than feed haphazard.

In deciding how much to feed a cow, her live weight, loss by excessive exercise, amount of milk produced and the changes of temperature, must be considered.

The balanced rat[illegible]s for 28 pounds of dry matter for every 1000 pounds of live weight. This ration should contain 2.5 pounds of protein, to form casein in the milk and the lean meat of the body; 12 pounds of carbohydrates (this is the digestible starch and sugar); half a pound of fat. This gives a ration of 1.5 which means the proportion of protein to carbohydrates and fats. This is a balanced ration. Any excess of protein makes it narrow, while any excess of carbohydrates makes it wide. The ration for dairy cows is narrow, while that of beef cattle is wide. Protein has an effect, that we cannot understand, in that a dairy cow can be fed on a too narrow diet, and will often give more fat in her milk than she receives in her food. This is, however, reaching a danger point and the calves will show it and the next generation be weakened.

The watering of cows in California is many times neglected. There should be abundance and it should be convenient, for cows ought not to climb up and down steep banks; indeed, often they will go thirsty rather than do so. Any decrease in the milk flow from lack of feed or water is not made up in an increase per cent. of butter fat, and lack of water in fresh cows often produces congestion of the udder. The elimination of the wastes of the system must be carried on by water in the secretions.

Bran is almost a universal feeding in California, yet we believe, except for sick cows or at calving time, it is a too expensive feed when alfalfa is grown for the hay and can be chopped and added to the rations. If the alfalfa chop is wet over night and then mixed with the grain feed the cows like it. The difference between alfalfa hay and bran is in the carbohydrates and these can be added cheaply from corn. One hundred lbs. of alfalfa hay has 36.6 per cent. carbohydrates, and 1. 1-2 pounds of fat and 11 pounds of protein, while bran has to the hundred pounds, 11.2 lbs. protein, 42.2-10 lbs. of carbohydrates and 2.5-10 lbs. of fat.

Rice bran we found the cows do not like so well so that settled that feed. Cocoanut cake is liked and does very well when not fed to exceed four pounds a day. Salt should always be kept before the cows, but we do not believe in salting their food for them, though Prof. Cook does. We would not like anyone to salt our food for us so we would be thirsty all the day. When the pastures are fresh and good the cows will require little grain food except extremely heavy milkers. These should be fed for it is cruel, as well as wasteful to allow a cow to grow thin under heavy milking. A heavy milking cow may not be able to obtain enough nutriment from the grasses, as the bulk required may be more than she can digest; then she becomes weak and thin. A little grain will help her out. Malt sprout and distillers grains are hardly fit to feed if furnished wet as they sour quickly, and are really swill before they reach the cows. In the east they are dried and then make a fair cow feed. Linseed meal is used as a condiment more than as a food, in interior parts of the State. While the quality of the milk a cow gives is largely fixed by nature, we can find our gain increasing the quantity. This may be done by feeding the narrow ration. While we have fed a variety of food to cows, including raisins and dried fruits, still our standard rations have been as follows:

The following was used while wheat was very low: Four pounds of bran; 4 pounds of chopped alfalfa hay; 4 cocoanut cake; 1 pound of oil cake meal. This second one is a favorite: Thirty-five pounds of corn silage; 4 pounds of chopped alfalfa hay; 4 pounds of rolled barley; 2 pounds of cocoanut cake. The third ration is merely a variation: Thirty-five pounds of alfalfa silage; 6 pounds of Egyptian corn; 2 pounds of rolled corn and 2 pounds of cocoanut cake.

Ten pounds of alfalfa hay is allowed with these rations. Often a cow was given a larger amount. In the feeding alley at the back of each cow's manger, we used colored chalk to indicate the feed, a cow [illegible]g out of milk has a white cross that means to decrease the grain ration, a fresh cow has a blue cross, that means increase slowly until she has her full can; a yellow cross means full ration; while a red cross means give her all she can eat. Now to balance this so no cows will have too little the silage is fed out in the yards and put out at the rate of 35 five to the cow, but should there be more than the usual amount of dry animals this is increased until there is enough left in the mangers to feed to the calves, usually about one extra cow's ration. It never pays to under feed.

Where the family of small children do the milking and are receiving their training in usefulness, a cheap ration and less profitable cows can be used with good results financially, as the outlay of thirty dollars a month and board is saved for each milker. Some of our neighbors use the following with good results: Thirteen pounds of alfalfa hay; 13 pounds of good barley hay. This lacks succulency and the cows require to run out to pick up a little green stuff. Again some feed 25 to 30 pounds of alfalfa hay and fill up other racks with wheat straw. The pie melons, watermelons and pumpkins are added to this with fairly good results.

To be useful in dairy management, we must not only feed our cows intelligently, but by the use of modern means of handling the milk make it pay. This is first, in sanitary cleanliness; whitewash every building that the cows go under for cover, keep things sweet and free from bacterial taints. Then our calves must be fed in the best way to make them profitable, we believe we will in a few years, see the large separator at the creamery not at work, but that every farm will have its own machine. The creamery men are blaming the poor quality of the butter this winter, on the farm separator, and it may be true, but then it only argues that the butter makers will have to use the acid on each lot of cream that comes in, and not do as many do at present, dump it all into one vat and let it

stand until they are ready to churn. The cream will then have to be churned when it is ready or be held in a cold storage room. The farm separator was never placed on a farm where stock was raised, to be abandoned. The time alone wasted in standing around a creamery waiting until the milk runs through the separator will soon pay for a small separator. We lost a large and valuable bunch of calves by feeding milk from a creamery. Today we would rather feed the calves on hay tea than chance the risk of feeding the stale skim milk sent out as pasteurized, to the farmers. We believe it is not so much the dirt or disease as it is the changing temperature that the milk undergoes that taints it for feeding.

DAMAGED WHEAT AS FEED

The Department of Agriculture sends out the following on damaged wheat as a feed: It will apply to California conditions in the Northern part of the State where more or less damaged wheat is raised every year. Not long since a subscriber in Inyo county, asked the question whether rust in wheat damaged it as feed and we answered , yes. But these authorities would seem to hold that there is no danger in damaged wheat as feed.

Every year more or less of the wheat crop is damaged by excessive moisture, freezing, rust or other diseases, etc., and is for that reason of poor milling quality and unmarketable. In particularly good seasons the amount of wheat of poor quality produced may be so small as to be of little importance, but in unfavorable seasons the proportion of inferior wheat is often so large as to make its profitable utilization a very serious and important problem.

Several years ago D. N. Harper, of the Minnesota Station, made a very thorough study of a large number of other agencies, and showed that while such wheats were in most cases of poor quality for milling and for seeding, they contained on the average somewhat higher percentages of protein than normal grain, thus indicating "that they would be good for feeding purposes." His results and conclusions have been confirmed by more recent analysis by H. Snyder, of the same station, of samples of rusted wheats, which showed such wheat as a rule, to contain higher percentage of protein, fiber and ash, but less carbohydrates than fully matured grain from rust-free plants grown under the same conditions. One of the samples of rusted wheat examined by Snyder contained as high as 19.3 per cent. of protein, while normal wheat contains on the average only about 12 per cent.

E. T. Shutt, of the Canadian Experimental Farms, found that the grain of rusted wheat is "small, immature, rich in protein, and deficient in starch."

M. E. Jaffa, of the California Station reports analyses showing that shrunken wheat contains 17.1 per cent. of protein and 66.78 per cent. of carbohydrates, as against 11.7 per cent. of protein and 72.65 per cent. of carbohydrates in plump wheat.

These investigations all indicate that any unfavorable condition which interferes with growth and hastens maturity generally results in the production of grain which is higher in protein and lower in carbohydrates than normal grain. And while such grain may be of inferior quality for milling, it may from the standpoint of composition be of somewhat increased value for feeding purposes.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

As L. Foster points out in a press bulletin of the Wyoming Station, a number of experiment stations, notably those of Kansas, Maine, Michigan, Ohio, Utah, Wyoming, and Canada, have made experiments which show that when properly fed wheat gives results with all kinds of stock practically equal to those produced by corn.

In composition and digestibility it is superior to corn, but it differs from corn in the fact that when fed alone stock will not eat it as well and do not seem to have the same relish for it, because it is too sticky when ground, adhering to the teeth and gums. There is greater danger, too, of overfeeding than with corn, but when fed in connection with other grains, or particularly with bran, there is little danger of getting the animals off feed, and all kinds of stock then seem to like it fully as well as corn and make equally as good gains on it.

There is good ground, therefore, for the belief that when for any reason a considerable amount of wheat is produced which cannot be marketed to advantage it can be profitably utilized as feed.

In Canada and other northerly regions frozen wheat is probably the most common form of damaged wheat, and has therefore been more extensively experimented with than other kinds. The analyses which have been made of frozen wheat indicate that it is likely to be slightly poorer in food constituents, especially protein, than normal wheat, probably owing to the fact that it has been arrested in the process of maturing and not hastened to maturity, as in case of rusted wheat for example.

In experiments made in Canada, frozen wheat gave a return of about 60 cents per bushel when fed to steers, and from 45 to 75 cents per bushel to pigs, depending upon the way it was fed. The best results were obtained when the grain was ground or soaked for twenty-four hours before feeding. Both the beef and the pork produced was of superior quality. In experiments at the Utah Station frozen wheat was compared with good wheat and wheat screenings as a feed for sheep. The animals made profitable gains on all three feeds, the screenings (containing alfalfa and clover seed, cracked and shrunken wheat, etc.) giving somewhat better results than either frozen wheat or good wheat.

According to J. W. Wilson of the South Dakota Station, a considerable amount of wheat in the northwestern part of the United States was damaged by rust in 1904 and its value lessened for milling purposes. In comparative tests of the feeding value for pigs of two lots of such damaged wheat weighing 57 and 44 pounds per bushel, he found that rating pork at 4 cents a pound the heavier wheat gave a return of 63 cents, the lighter 57, per bushel. The heavier wheat contained 13.21 per cent of protein and the lighter 12.01 per cent., and practically the same amount of carbohydrates, 72 per cent. The heavier wheat was not only a richer feed, but was apparently more digestible than the lighter.

FOR SALE
RUSSETT DUCHESS, 160014
ADVANCED REGISTER, CLASS A, A. J. C. C.

This cow has recently completed a Yearly Authenticated Fat Estimate, giving milk, 8445 lbs., 15 oz.; butter-fat. 411 lbs., 15 2-5 oz. She is a daughter of Vela Hastings, Advanced Register, Class A, with a similar record, of milk, 7486 lbs., 3 oz.; butter-fat, 450 lbs.

Due to calve May 30, to Sargent Fox. For price address

C. W. LEFFINGWELL, JR., WHITTIER, CAL.

the subject are recorded, the indications are that many of the damaged wheats are, as a rule, somewhat less digestible than normal wheat on account of their poor physical condition, which prevents thorough mastication. In order, therefore, to get the full benefit of such feeds they should be ground or thoroughly soaked, or both ground and soaked before use. The Canadian experiments indicate that unground or cracked grain should be soaked forty-two hours, and that ground grain is improved by soaking at least twelve hours. As already indicated, the wheat should not be fed alone, but gives the best results when fed in connection with other grain feeds or mill products, such as bran, or with succulent root crops. At the Canadian Experimental Farms pigs were fed as much frozen wheat as they would eat up clean, in connection with as much skim milk as they would drink, with excellent results both as regards rate and profitableness of gain and quality of pork produced.

KEEPS UP THE HERD.

Editor Cultivator:—We do not raise Jersey cattle for sale, they are for our own use and for butter purposes. When we commenced some six years ago, we fixed a standard which we have reached, which is 365 lbs. butter a year for every cow in the herd. For 1905 we did somewhat better. Every cow which does not do that goes to the butcher and is killed. We have a herd now of 75 milking and 52 young heifers, have four bulls of the best type we can get, will have no other. We do not register the cows as they are for our own use only.

E. Booth, Cosumnes.

CALF CHOLERA.

There can be no question, says Dr. Alexander, that calf cholera is due to a germ or microbe and that this microbe may be present in the calf at birth or get on to it as it passes through the vagina, or infects its raw navel cord when birth takes place in an infected stable or the calf is put into a pen previously occupied by a scouring calf.

In view of these facts, every breeder should make it a practice to seek the prevention of scours and navel infection by antiseptic measures. The calf should come in a clean, disinfected, freely bedded and whitewashed box stall. The vagina of the cow should be immediately flushed out with a gallon of 1-1000 solution of chloride of zinc and the injection should be repeated before and after the afterbirth comes away. The belly and navel of the calf should be instantly washed with a 2 per cent. solution of coal tar disinfectant and then wetted with a 1-500 solution of corrosive sublimate, this latter application to be repeated twice daily until the navel cord (umbellicus) shrivels up, drops off, and leave no raw spot behind. Such treatment will not only prevent scours in many instances, but is a sure preventive of navel and joint disease in calves, foals, and other young animals, all of which should have similar treatment of the navel.

In addition to treatment of the vagina of the cow and navel of the calf, the udder of the cow should be washed with a 2 per cent. solution of disinfectant before the calf is allowed to suck, and such attention to the udder should be persisted in until the cow has cleaned and all discharges from the vagina have ceased. For the latter reason the vagina should be flushed out once daily until the tenth day, as this will not only prevent infection of the calf but cleanse the cow in a manner likely to destroy germs of contagious abortion possibly present in her discharges. It may be mentioned that every newly calved cow has what is called the "lochial discharge" about the ninth day after calving and until this comes away and the cow has been cleansed by injection one cannot consider her safe to go among other cows or to be served by the herd bull.

Even where the calf is not allowed to suck the disinfection of the cow should be carried out on general principles, and when every breeder treats his cows and calves in the cleanly manner we have outlined abortion, scours, and navel infection will be little heard of.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

HOG PASTURE.

The hog is a pasture-loving animal. With pasture he thrives, keeps healthy and pays a premium for the grain which he consumes, while without it he degenerates, gets out of condition, and becomes an easy mark for disease. It is the men who raise hogs without pasture that usually tell all manner of hard-luck stories. Their brood sows have small litters, the pigs are weak, the sows eat the young, and cholera often gets into the herd. Feeding hogs without pasture means selling corn at a poor market.

For those who can grow it, there is nothing better than alfalfa for a hog pasture. It is an ideal frame builder and a great bone and muscle maker. One acre of good alfalfa will pasture from ten to a dozen hogs without their eating it too closely. It stands pasturing better than red clover and makes a better feed. Hogs on alfalfa pasture without grain in Kansas and Nebraska make about one hundred pounds' growth during the summer and develop a frame that will stand up under heavy corn feeding during the autumn.

Next to alfalfa for this purpose stands red clover. The principal difficulty with clover is that it is not a permanent pasture plant, and is not apt to hold its own for more than one year. If red clover is to be used, two pastures are necessary, one to seed down while the other is being pastured, and so on, back and forth, from year to year.

For a short-order hog pasture, a heavy seeding of a mixture of rape seed, barley and oats is a good combination of seeds to sow. This is not as much relished as is alfalfa or red clover, and is not as nutritious, neither is a pasture on fresh spring plowing as free from dust during a dry season. It is nevertheless an indispensable requisite to profitable hog raising where the better pastures are not to be had.

Experiments made at the Nebraska, Wisconsin, Illinois, Canada and other experiment stations indicate that from sixty to eighty pounds of grain go farther when fed to hogs on pasture than one hundred pounds of grain without pasture.

There was once a profit in the pen-fed hog, but those days are past. The hog raisers have found a better way. They can be grown so much cheaper on pasture that there is no money in the hog that is fed all summer from the pail or basket.—Colman's Rural World.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

DIFFICULTIES.

This year there seems to be in some sections of the country more than usual difficulty in hatching. There seems to be so much moisture in the air in many places, especially near the ocean, that the eggs do not dry out properly and the big, fully developed chicks die in the shell, smothered or drowned; not having room enough to turn in and kick out of the shell.

Occasionally, but rarely, I find a poor hatch from eggs drying out too much, the air space being too large. This occurs from too much ventilation and has happened twice to my knowledge in one or two of the best incubators on the market. The lower felt in two instances I found had either shrunk or did not cover the bottom and there was therefore too much circulation of air; in one case the incubator had been moved and the felt had slipped to one side leaving nearly half the bottom open. The lady owning this machine did not know where the trouble was; she only knew she was having very poor luck. "Perhaps you do not air your eggs enough," I suggested. "I am sure I do not know," was the sorrowful reply, "but a hatch came off yesterday and I will show you the eggs that did not hatch." I visited the incubator room; a nice, dry, well ventilated, plastered room, an ideal place for an incubator. I broke open an egg, half the egg was airspace and at the small end the chick lay dried up. "You have aired the eggs too much," said I, "not too little, see they are all dried out too much." "But I never aired them at all, except when I turned the eggs!" I remembered the felt and said, "Is the felt all right at the bottom of the incubator under the burlap bottom." "I suppose it is!" was the doubtful answer. I took the egg tray out, removed the bottom and there found the felt, slipped to one side so that nearly one-third of the bottom was entirely open and the circulation of air had been too rapid. In two instances the felt was about four inches too small. I do not know if it had shrunk or had been cut too small.

I sometimes receive letters from folks having poor hatches asking "Why are chicks dead in the shell?" Some people even forget to tell me what machine they are using and give me no clue to the enigma, so I can only reply usually—"from insufficient ventilation," sometimes, but rarely, "from too much circulation of air in the incubator," sometimes "from weak germs in the egg," or "the parents being wrongly fed, not having green food or animal food enough in the rations."

I can only give these suggestions which may help some, and would say again, follow very closely the directions of the makers of the incubators, it is to their interest for you to have good hatches and if your eggs are

Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you NOW have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line

not drying out, air them more frequently, keep the ventilators open more than usual each operator must judge for himself or herself and experience is the best teacher.

There are so many letters this week in our question box, (this talk on "difficulties" is in reply to one from J. F. B.), that I will ask our readers to consider the questions and answers as part of our weekly talk. I have often noticed that when one person is in difficulty several will be in similar trouble, so I hope my replies this week will come in opportunely to other readers.

* * *

EDITOR'S QUESTION BOX.

Turkeys and Ducks (E. M., Escondido): In reading your paper this week I see you have quite a little about ticks and mites, and I thought that I would tell you of a little experience we had.

We have small hen coops that we can lift around, they got covered with mites before we knew it, we tried several remedies but all failed, so last fall when my husband fumigated the fruit trees he tried the cyanide and acid on the hen coops and it worked fine. He put the big tent over the coops, put the cyanide and acid inside the coops and left it there for two or three hours, then aired them well.

1. Will you please tell me in your paper the best way to run an incubator to hatch turkey and duck eggs, are they to be treated the same as chicks?

2. Where can I get pure Indian Runner duck eggs or ducks?

Ans:—I am glad the cyanide process has proved so successful with the mites, and I hope other readers may benefit by your experience.

1. Turkey and duck eggs require twenty-eight days to hatch. Duck eggs need more air than chicken eggs and often are benefited by being moistened with a little warm water. Turkey eggs should be treated exactly the same as chicken eggs. If you have not many turkey eggs it is best to set them under hens or turkeys.

2. You can get pure Indian Runner duck eggs from any of our advertisers.

* * *

Trap-nests (W. E. L., Santa Barbara): I would like to receive a copy of the Cultivator, I don't know the date, but there is an article in it on trap nests for poultry and I am interested. I read the article in a copy of your paper that was lent to me, and I am disposed to think that the idea is a good one. I can hardly believe that the person who wrote the article also furnished the illustrations. The writer of the article says the box is thirteen inches square inside, but the box in the illustration is a long ways from being square. The writer when describing a door that fits into this opening, which is thirteen inches square, states that the door is ten inches deep and that there is an opening of 2½ inches under the door and 1½ above the door. It is difficult to see how all this is to go into a thirteen inch space.

If the nest is capable of developing a hen that will lay three eggs in one day, it certainly is worthy of more accurate description and plans.

Ans:—The length of the nest as given in the paper was 27 inches. The nest proper, that is the box in which the hen lays, is thirteen inches, the space above the door is 1½ inches and below the door 1½ inches. If you cannot understand by the descriptions and plans given, you had better send and buy one of these nests already made. Henry Albers Co., Los Angeles, keep these nests ready made.

* * *

Chicken Lore (D. L. E.). Can you tell the readers of the Cultivator if fowls can ever be sold for pure blood, whose mothers of three generations back were with a male of another breed for a time. Also if pullets are mated to the same bird that produced them, will their eggs hatch strong chickens?

In the article you speak of "hooking together" the panels for a chicken yard. How hook them together, do you put on hooks, or do you twist ends of the cut wire?

Your article on "dry feed" in hoppers was just what I wanted to know.

Answer:—First: Fowls whose mothers three generations back were with another male can be perfectly sold as pure breds.

Second: Like produces like, if the parents are vigorous and healthy the off-spring will be also. Should the parents be sickly their offspring will have a tendency to have the same disease, at the same time of year as their parents.

Third: The panels can be hooked together by a small hook and eye at the corners, or, can be tied together by string or wire.

I am glad the article on "dry food" was useful to you.

* * *

Feeding Indian Runners. (Mrs. E. B. M., Hanford, Cal.): Thanking you for your previous information I come to you once more. Will you please tell me what to feed Indian Runner ducks, young ones.

Is it advisable to let them go into the water a day or so after hatching?

Will the lice bother them like they do chickens?

Answer:—The rule for feeding little ducks is: Two parts bran, one part corn meal, one tenth meat meal or beef scraps and always a little sand (about a teaspoonful at a meal, for ten).

Do not let them swim in water until they are eight weeks old, or they will get cramps and very likely die.

When the ducks are very young they sometimes get the big grey head lice from the hen mother. I usually take the hen away from them, if the weather is pleasant, when they are a week old.

* * *

The Moisture Question. (F. X. D., Fullerton): Will you please let me know through the columns of your paper how much moisture is necessary to hatch duck eggs in an incubator and how to apply it. I find many of the ducklings fully developed in the eggs, but only about 10 per cent get out. I kept the moisture trays filled with water after the 15th day. Also at what temperature should the eggs be kept, and how long should they be allowed to cool when turning.

Answer:—It is impossible to answer you fully, as you do not mention the kind of incubator, not even the name. You had better write to the maker of your incubator for full directions for hatching duck eggs.

Duck eggs usually require more airing or cooling off (and also some moisture with warm water) than hen's eggs.

The directions on your incubator will tell you at what temperature you should operate it.

I should "guess" that the reason your ducks do not get out of the shell is that the air space is not large enough, but not knowing your machine it is a mere guess.

* * *

Sanguineous Eggs. (M. C. S., Santa Monica): Found a fresh laid egg yesterday which, on breaking, contained dark blood clot about size of a pea in the white of the egg, and the whole white looked bloody, but the yolk appeared normal. Have never seen anything of this kind before, and am puzzled as to the cause.

Have Barred Rock, Orpington and Leghorns. Feed them rolled barley mainly, with a change to wheat and Kaffir corn in litter for the grain feed, and dry mixture of 2 parts bran, 2 parts alfalfa meal, 1 part feed meal and 1 part meat meal or beef scraps which I keep before them all the time in a hopper, and besides this green food in the shape of weeds, grass and alfalfa.

Would appreciate an answer in your valued department as to the cause of the trouble.

Answer:—Dr. Salmon in his "Diseases of Poultry" says: Occasionally small bloodclots are found in eggs, usually in the albumen. These result from a slight hemorrhage which has generally occurred in the upper two-thirds of the oviduct. Such hemorrhages are the result of great functional activity and congestion of the blood vessels of the reproductive organs. They are excited by any of the causes which lead to congestion and inflammation, and are to be counteracted by green feed, less animal food, and suppression of condiments. They result from use of too much pepper, stimulants or so called "egg foods."

THE FEATHERLEY FARM ORPINGTONS

Over 30 prizes, specials and cups in **Buff, Black and White Orpingtons** on 27 entries this year at San Francisco, San Diego and Los Angeles. JUDICIOUS BREEDING

"This subject has frequently been agitated in poultry publications in its application to poultry breeding for the last twenty years, it being an important question to those who seek to fix any particular type or characteristic in their stock; and although the subject is an old one, which has been worked over and over again, from every possible standpoint, still, the question is often asked: "How far is it desirable to breed fowls in and in."

"It has been abundantly proved," says a writer in Fanciers' Gazette, "that by continuing this practice too long a time, or if done carelessly, without selection and discrimination it results in constitutional weakness, decay, reduction in size and loss of fecundity. On the other hand, it has been generally well proved that it is not prejudicial, but advantageous in standard breeding if intelligently practiced, and results in great satisfaction.

"Inbreeding in dogs, cattle or other animals, we leave to those who have studied that branch of reproduction, and confine our remarks to poultry only. It is asserted that in animals, where it is desirable to develop the nervous temperament and mental qualities, crossing is preferable; but in fowls there is nothing gained by great development of brain, and it is a question whether or not this assumption is well founded when the selection of the animals for inbreeding is intelligently made. Then again the extent to which inbreeding can be pursued without injury has been studied, and found to be much slower in injurious results than it has been generally understood to be, where the same has been intelligently practiced, so much so that many are led to believe that it can be carried on indefinitely. The great object of inbreeding is to improve the stock in certain things, as for instance, a peculiar comb, a certain shape, or, fine color or markings. A male, of good form and size, may show remarkably fine coloring throughout, or perhaps may have phenomenally fine markings in some section, something, in fact, far superior to that of the flock in general, or even that found in the best of the breed, and there is a desire to produce it in the flock, which can be attained by carefully mating him with a female, the best one to be had, both in form and color. The next season mate the best of the pullets from this mating, which should show good style and constitution to their sire. The pullets from this mating will be in blood three-fourths of the sire and one fourth of the blood of the first dam, and if the sire is strong in imparting his own characteristics, some of this second generation of females will show his straits strongly, and can be used with hopes of reproducing them generally. Perhaps this is as far as it may be safe to inbreed, but if the old sire still maintains his form and vigor and the last generation shows no signs of degeneracy, then we would again mate him with females carefully selected from the second generation and thus establish in the stock seven-eights of his blood. As a general rule this direct inbreeding should stop here."

"For fresh blood for the foregoing stock, we would procure a female of another family of the breed remote in relationship but possessing the characteristics sought as far as possible, and mate her with a fine male of first generation, which should show the desired straits; and from the males from this mating one can be selected to mate with the females of the third generation and every year thereafter, by introducing fresh blood through an unrelated female, mated with a fine male from the generation last preceding. Keep up the work of improvement, at the same time preserving the constitution and vigor of the flock."

"By breeding two families of the same stock, as herein directed the question of deterioration from inbreeding would be almost wholly obviated, while the uniformity and advancement in quality of stock would be largely under the control of the breeder."

One writer, in the Dakota Farmer, describes his poultry houses as one large room, ample enough to hold his flock. His roosts are constructed so as to pull up out of the way in the day time so the poultry can have the whole house as a scratching shed. His fowls cannot get on the roosts in the day time, for they are out of their reach. In the evening the roosts are lowered and the same apartment is converted into a roosting room. He likes it reasonably warm, but not too warm. In the provision for a scratching pen one must use judgment. In this climate where there are few days that chickens will not be out of doors a double purpose hen house would not be necessary, but still the hen house so arranged as to make a scratching pen in the day time would be all right. and useful provided there is not natural shade for the chickens to go and scratch under.

The eggs for hatching should be only those from well-developed, full-grown pullets or from vigorous hens.

CLEANING THE BROODER.

When I first began to use brooders I tried many ways of bedding them, so they could be cleaned easily, and quickly, as well as thoroughly. I used sand, but that got damp and "balled" on the toes of the baby chicks. Then I tried chaff, oats-chaff collected where the separator stood when the oats were threshed. That did pretty well, but the floor where the chaff was scratched away, would get very much soiled. Then I tried carpeting the brooder with grain sacking, cut the sacks open, then fit them to the floor of the brooder, tacking them snugly to place, (don't drive the tacks in too far, so they will be hard to pull out again,) as you would a carpet in a dwelling.

Over this scatter whatever you have for scratching material. Here I use alfalfa chaff, in Illinois I used that from the oats. Put it in rather lightly at first when the wee biddies are somewhat uncertain on their feet, though be sure to put in enough to cover well. This catches the droppings, and you will be surprised how clean the sacking will remain. Every morning I take dust-pan and a whisk broom, and brush up the litter, taking it out of the brooder on the pan. Any thing that may cling to the sacking may be scratched loose with a chip or trowel, (I have an old masons trowel,) and a brisk brushing with the whisk broom will make it look fresh and clean. When this is done, I put in fresh litter, and my brooders are sweet and pure, with no foul odors, and the work has only taken five or six minutes times to each brooder. They will not need fresh "carpet" more than once in two or three weeks, when the brooder should then be washed free of all stains and dirt, sunned and dried carefully. Another advantage of the cloth over the floor is giving the newly hatched chicks a firm footing, and thus preventing them slipping till some are cripples from over-stretched muscles. You have all seen—I am sure—little chicks sprawling about, unable to draw their feet together and stand firm upon them. Any hard surface upon which they stand, or run, is apt to make them slip, and they cannot regain their footing quickly.

The greatest factor in the health of brooder chicks is cleanliness, and the busy woman will hail with joy, any plan to secure that, with the least work. And "busy woman" spells the name of every poultry woman, for the next three months, and if she is also housewife, friend and neighbor, I think it would be "busiest woman." But even if you are the last named, don't, please don't, forget to keep a record of the number of chicks you take off this year, and send it to the editor this fall. The "ranch mistress" adds no small amount to the annual income, by her sale of eggs and fowls, to say nothing of the saving on the meat bills, by the eggs and chickens served on the home table.

I have been having a good deal of trouble lately trying to keep track of my turkeys. They are White Hollands and not very "prone to wander," still they do like to slip away into secluded places to make a nest.

There came to my notice the device of one woman to tell the whereabouts of her turkeys, that I consider most excellent. 'Tis nothing else than a small bell attached to each turkey hen, thereby to track her, and also to frighten away any animal that seeks to disturb her on her nest, or with her young poults. I am going to try it when my turkey hens set, later on. Just now their eggs are being tucked under quiet, broody Brahmas, but after a while I will let each turkey hen incubate her own eggs, though I think I will give them to a Brahma to raise. They perform the task for me much better than does the turkey hen.—Mrs. W. B. Chandler in N. W. Horticulturist.

TREATMENT OF ROUP

Wallace's Farmer says the one symptom of roup which is unmistakable is the peculiar sickish smell which accompanies it. Once recognized it is impossible to mistake it, and the wise breeder at the first whiff of a roupy smell in his hen houses looks over his flock, clears out all suspicious subjects, disinfects the house with carbolic acid or any other convenient disinfectant, provides fresh litter, and gives a tonic to the flock. We have found onions or a feed of grain soaked in kerosene as good tonics as expensive drugs, and more convenient.

Aside from the smell the symptoms of roup are one or all of the following: Cancerous running sores break out on the head, in the mouth and throat, with a watery discharge which becomes firmer in character and more offensive in odor. The diseased secretions finally kill the bird by suffocation. The treatment is to remove the ulcers, apply powdered borax or pyrozone (peroxide of hydrogen), and mix a teaspoonful of powdered sulphur in the food. Repeat twice a day. Give nourishing food.

GREAT INDUSTRY.

It is no insult to be called a chicken crank or poultryman. Those who have allied themselves with the little hen have joined forces with an industry that makes gold mining sink into insignificance.

The poultry and egg business in the United States amounts to $280,000,000 a year while the hog can only root up the sum of $186,529,035. Yet the hog is known as the mortgage lifter of the country—and he is that. It is not to belittle the hog but to help you appreciate the hen that we make this comparison. But the poultry business is nothing in comparison with what it can easily be made, in the next ten years if the experiment stations and farmers' institutes would show the hen up at her true value. Nearly all stations are reporting on hogs, cattle and sheep, and only two or three actually trying to find out what can be done with the hen. Every farmers' institute program discusses hogs, cows, corn and crops, while few ever give one hour to the discussion of the poultry interests. For the amount of care and food given what on the farm makes such a showing in profits as the insignificant, much-neglected hen? Give her better attention for she merits it.—Successful Farming.

General Agriculture

LEGUMES AS FERTILIZERS.

The formation of nitrogen by bacteria in the nodules on the roots of leguminous plants is such a well known and accepted fact that any assertion to the contrary is rather alarming.

Mr. Thomas Jamison ,Director of Research for Aberdeenshire, Scotland, has dropped a bomb-shell on the tubercle and nitrogen theory we have hitherto accepted as gospel. His annual report is just published and the Cultivator, always desirous of presenting the latest intelligence in the agricultural world, gives the following brief resume of his conclusions and leaves its readers to digest the statements made. These statements are considerably at variance with the conclusions of our own government experts:

1. "The legume tubercle theory is untenable.

2. "Nitrogen of the air is directly utilized by the plants."

In support of the first he says:

"In the first place there is the accepted fact that vigorous legumes may be grown without bearing tubercles, a fact, which as legumes always acquire nitrogen, goes far to show that the tubercles have nothing to do with the fixation of nitrogen.

"There is the other fact that the tubercles contain a fungus, which is sufficient to account for all the features shown by the tubercle, and as the weight of evidence in regard to fungi goes to show that fungi do not absorb nitrogen, it may be accepted that the fungus has nothing to do with the large fixation of nitrogen by legumes.

"Further we have seen that there is nothing exceptional in legumes having tubercles, for fungi cause similar tubercles on many plants. Even the large number and frequency of these tubercles on legumes need cause no surprise—it is the natural result on a nitrogenous plant of a nitrogen-seeking fungus, just as turnips are ruinously attacked by a fungus that causes club-root disease.

"The absence of bacteria in the tubercles being practically proved, or at least, the assumed evidence of their presence being reduced to nothing, the idea that bacteria fix the nitrogen comes to naught.

"It follows that the idea of symbiotic (mutual help) action has also to be set aside."

In support of the second conclusion he says that by chemical reagents he has found that the hairs, glands, and leaves with thin skins are the great agents in fixing nitrogen, and his experiments, with the illustrations published, would seem to prove the truth of his assertions.

Mr. Jamison has not produced sufficient proof to support his assumption that the legume theory is wholly untenable. There has no doubt been a great amount of rubbish published about the nitrogen fixing property of bacteria and much money has been spent in buying bacterial material to aid in the production of larger crops. Much of the material sold has for various reasons proven utterly worthless, and those interested may with profit consult the latest U. S. Agricultural reports anent this particular point.

It is nevertheless true that leguminous plants do render fertile, soils robbed of their nitrogen by other crops. The habit of planting beans for this purpose is probably almost as old as agriculture itself. The writer has seen printed references to this habit as early as 1665 and the manner of reference would indicate that it was no new custom. In the old world beans used for this purpose are always reaped so that the nitrogen stored in the leaves are not applied to the soil. The nitrogen must then have been in some measure stored in the roots. Jamison makes no reference to the possible transference of all the nitrogen fixed by the leaves to the root, and the truth or otherwise of his assertions shall be found to depend on this point.

To the practical agriculturist and gardener his conclusions are very valuable. They show again that to reap the full benefit of the nitrogen stored by growing crops these crops ought to be ploughed under while in early growth and also that it is quite superfluous to apply nitrogenous manures to root crops as they can form their own nitrogen, but cereals and grasses require much nitrogen. Rape, he suggests, will prove as valuable as leguminous crops for fertilizing purposes.

GROUND AND CUT ALFALFA.

The Colorado Experiment Station has completed an experiment in which a comparison between alfalfa cut in lengths of half an inch and alfalfa ground was made in the fattening of pigs. It required 4.77 pounds of corn and alfalfa, mixed at the rate of three pounds of corn to one of alfalfa to produce one pound of gain, while 4.81 pounds of corn and ground alfalfa, mixed in the proportion of three parts of corn to one of alfalfa were eaten for one pound of gain, not counting labor. With cut alfalfa costing $8 a ton and ground alfalfa $16 a ton, the cost producing 100 pounds of gain with the former was $2.62 and with the ground alfalfa $3.12. With corn and cut alfalfa fed in equal parts by weight, the cost of producing 100 pounds of gain was $2.72. With corn and ground alfalfa fed in equal parts by weight, the cost was $3.69. These results go to show, says the report of the experiment, that at the prices quoted cut alfalfa is more economical to feed than ground alfalfa, and that a ration consisting of three-fourths corn and one-fourth alfalfa is cheaper than one consisting of half corn and half cut alfalfa for fattening pigs. Grinding alfalfa is an expensive process, and it is doubtful if machinery can be improvised which will grind it as cheaply as it can be ground by animals.

FARMERS' HORSE COMPANIES NOT A SUCCESS OUT WEST.

Writing in the Rural New Yorker, a farmer says: "I have been in a French Coach Company, $30,000 horse, 15 stockholders. We paid half too much in the first place; same horse could have been bought for cash for one half the money by dispensing with the organizer, who had to be paid to do the work. But farmers, with us at least, will subscribe $3000 to a stranger's proposition quicker than to raise $1000 and send a good man or two of their neighbors to buy what they want. The keep of a company horse is greater than of one privately owned, as it does not take all of the man's time to take care of a horse, and he can do some of his own work besides. They are generally kept by men who own or are interested in other stallions, and some of the high-priced company horse's business is knocked down by keepers in favor of some cheaper horse, but just as good. The service fee is not paid nor collected as promptly as where one man has it all his way. The colts do not pan out; the Coach is not as prepotent as either the Percheron trotter, running horse or Morgan. Colts take too much after mares in size, shape and color, thus dissatisfying breeders who quit after a trial of horse. Interest and insurance still going on with keep soon makes it a losing proposition. The three or four good men in the company have eventually to pay the delinquent's share of which there are always some in those companies. In Kansas they had the same experience and you can never get a man that has been in one of those companies to join another, unless it be the keeper.—A. D.

FOREST PLANTING STATIONS.

Seven different States now have eight forest experiment stations, established during the past year, for co-operation between the Forest Service and State forest commissions and agricultural colleges. These stations are designed to meet the growing demand for detailed information on the propagation of forest trees in various regions.

As a result of regional studies and special investigations, the Forest Service is already in possession of very complete data on tree growing for protection and timber supply, and this information is gladly supplied upon request. There are many questions, however, regarding new species, nursery methods, mixtures, spacing, and cultivation which can not be satisfactorily settled by studies of existing plantations. These matters will be investigated by a long series of systematic experiments, now under way at the new stations.

The co-operating institutions in most cases contribute the necessary land, and share all expenses for material and labor equally with the Forest Service. The Service passes upon all plans and directs the general operations. The results are the joint property of the co-operating parties.

The outcome will be to determine the regional adaptability of new species and the influence of soil and location on the selection of species, and to secure silvicultural data on methods of planting and cultivation. At Berea, Ky., particular attention will be given to the propagation of hickory, a wood for which no satisfactory substitute is known and for which the demand is destined soon to outstrip the supply. On the plains and prairies the trees will be tried which promise to be the most useful to the farmer under the local conditions. Experimental blocks will be planted annually, but many years will undoubtedly be required before completely satisfactory final results will have been attained.—Press Bulletin No. 125, Forest Service.

A man entered a restaurant, took a seat, and, after a little deliberation, asked the waiter for "a plate of fly-specks." The waiter reported the uncomplimentary request to the proprietor, whereupon the latter approached the customer and informed him that they did not serve "fly-specks." "Then," was the reply, "why don't you take them off the bill of fare?"

GENUINE OLD HICKORY
FOR SUMMER COMFORT ON THE PORCH OR LAWN

The warm weather of the summer months will soon be with us and we will all improve every opportunity to adjourn to a shaded porch or lawn to enjoy the summer breezes and the comforts of an easy chair or rocker.
The old Hickory furniture is the most suitable for out-of-door use. It is strong, durable and comfortable. We are now showing a large line of exceptionally well made pieces of the genuine old hickory, which we would like you to see.

Queries and Replies

MUSTARD SEEDS.

W. W. G., Santa Maria, wishes to know market and price for mustard seed. Who can tell him?

RUSTY TOOLS.

Editor Cultivator: I have some "rusty" bits, which I use quite often for boring. They have frequently been left exposed to the weather and consequently have become rusty. They are sharp, but owing to the rust they do not do good work as the rust causes too much friction. What method would you suggest to adopt in removing the rust. I am afraid to tackle them for fear of ruining them. Please advise me in this matter and oblige. A. B. G., Ukiah.

One of the most experienced cutlers on the coast states that only acids which will eat the steel will clean off the rust. Better oil them to prevent further rust, and in future take better care of them.

TO FRUIT GROWERS.

Professor Wickson of the State University has sent out letters to the farmers of the State asking their advice as to the requirements desired in the new varieties of fruit in California. Professor Wickson has been asked to speak at the annual convention of the Association of American Nurserymen soon to be held in Texas. It is his purpose to gather data for the subject of his speech. The letter sent to the farmers of California follows:

Dear Sir: I have accepted an invitation to prepare a paper for the annual convention of the Association of American Nurserymen which will soon be held in Texas, and have chosen this subject: "Specific Requirements of New Varieties in California Fruit Growing." My idea is to present to this great society the fact that California fruit growers, shippers and preservers do not need new varieties which are simply novelties which might please amateurs, but there is a demand for new varieties which will remedy some defects in the present standard varieties and for new varieties which will lengthen the season or fill in gaps in ripening between varieties now grown largely. It seems to me this will attract the attention of plant breeders and help them to produce something which could be profitably added to reduce the present disposition of new planters to plant too many varieties and to plant many novelties instead of concentrating upon those varieties which the great commercial handlers of fruit need in their industries. Will you kindly assist me in this undertaking you are interested in, which you will find to be by naming the varieties of each fruit worth the most money, and what points a new variety of any particular fruit should have to be valuable? The sheet I send herewith gives places for observance of this kind. I do not desire to ask too much; please report upon few or many fruits as you find convenient. A report even upon a single fruit which you are most interested in would be very valuable.

Very respectfully,
E. J. WICKSON.

The attached sheet referred to in the letter is a blank which the agricultural expert wishes the farmers to fill out. It contains a list of all the well known varieties of fruit. The producer is asked to name the best of the old varieties of fruit and what points are desired in new varieties.

DURUM WHEAT.

Desiring to learn the results of experiments made by the farmers of the State who have planted "Durum wheat", the State Agricultural Society asks all growers of this particular variety to forward information. Any farmer who has experimented with this wheat is requested to write J. A. Filcher, secretary of the State Board at Sacramento. It is claimed for this particular variety that it is less liable to rust, produces a larger yield, makes more flour to the bushel and better bread than the best of other known varieties. If true, this information should be widely disseminated for the benefit of wheat growers generally and thereby induce wider cultivation.

THE HIGHWAY COMMISSION.

Editor Cultivator:—Within the last six weeks the milestones have been placed on the Whittier road and on the San Diego road and sometime previously on the San Fernando road and the Los Angeles and San Bernardino road via El Monte. Already reports come to the Commission of malicious destruction of the stones by ill disposed persons who use the stones for targets for their rifles. At the last meeting of the Commission action was taken to request the Supervisrs to take measures to protect the milestones and road signs by enforcing the law. The president and Mr. Hille were appointed a committee to call the attention of the board and of the District Attorney to this wanton destruction. The District Attorney informed the committee that the statutes provide that such destruction constitutes a misdemeanor which is punishable by a fine not exceeding $500, or imprisonment not exceeding six months.

The Highway Commission desires to call attention of all concerned to this provision of law and it will use all means in its power to enforce the law.

The officers of the commission will be very thankful for any information that will lead to the arrest and conviction of any person shooting at or otherwise injuring or destroying any milestone or roadsign erected by it.

ALFRED P. GRIFFITH,
President.
C. L. LOWMAN,
Secretary.

In this issue appears the advertisement of A. W. Oliver as a real estate dealer at Long Beach. Mr. Oliver will be remembered by many Cultivator subscribers, he having been one of our representatives for two years. In real estate, as well as in other business, Mr. Oliver will give every man an absolutely square deal.

CRAINS USED IN CEREAL FOODS.

Continued from first page.

whole. The slightly crushed grains with the bran left on are called cracked wheat or wheat grits. Wheat is also rolled or flaked, and is shredded by a special process. The majority of our wheat breakfast foods seem to contain at least a part of the middlings, farina and gluten preparations being the main exceptions.

Wild rice (Zizania aquatica), also called Indian and Canada rice and water oats, is a handsome reed-like water grass native in North America, found as far south as Texas and north into Canada, being especially common in the north-central United States and south-central Canada. The Indians have long used its seeds for food, gathering the crop and parching it to improve the keeping qualities and flavor. Their white neighbors, and especially sportsmen, have more and more followed their example until wild rice has become a well-known food in the regions where it is abundant and has found its way to many clubs and homes and is now seen on the menus of some fashionable hotels, where it is served not only with game but also as a special cereal dish. It gets its name from a very slight resemblance to real rice, the seeds being longer, thinner, and darker in color than the latter, and having a more pronounced flavor. It requires much longer cooking than ordinary rice.

Wanted, a man to take charge of a cattle ranch; a first class man. So runs an advertisement in this issue, headed, " a position as herdsman." The Cultivator has many subscribers, over ten thousand, many more who read the paper, probably four readers to every paper printed, over forty thousand, but among the number who can tell our advertiser where the right man can be found. In this as in all other lines of business, except in few cases, the first class man is working for himself. Occasionally exceptional circumstances prevail and the man can be found. Who wants the job?

EARLY LAYING PULLETS.

A Minnesota pullet began laying when she was four months and eleven days old. A pullet in Pennsylvania dropped her first egg when she had reached the age of three months and 26 days. Numerous reports of a similar nature have been reported from the poultry yards of the Pacific northwest. What is your experience in this line?

Griggs—Have you ever been through the Holy Land?

Briggs—I've been over the golf links—Boston Transcript.

SAN FRANCISCO FIRMS.

In addition to the business firms heretofore mentioned the following San Francisco houses are located (some temporarily) as below given. Most of them are old time advertisers in this paper, some are now represented and others will be as soon as they are ready for business:

Whittier, Coburn & Co, are now located at 2028 Jackson street.

The Joshua Hendy Machine Works have opened an office temporarily at Bay and Kearney streets.

Trumbull & Beebe, seed store, will be found at 416 Jackson street.

C. M. Wooster & Co., real estate, have opened offices at 1166 O'Farrell street.

The Falls Manufacturing Co. have opened offices in the Baker Block, Berkeley.

Cutter Analytic Laboratory, temporary address, Grayson and Sixth streets, Berkeley.

Chatfield & Vincent, real estate, Grove street and Van Ness avenue.

Heald's Business College, temporary address, 1451 Franklin street.

Woodin & Little are now located temporarily at 701 Scott street.

Beck, Wakefield & Co.'s address is now at 2323 Fillmore street, San Francisco, and also at 205 N. Los Angeles street, Los Angeles.

W. E. Draper, representing the Cypher's Incubator Co., formerly on Sansome street, is now located at Third and Linden, Oakland.

A BIG SALE OF DAIRY CATTLE

Messrs. Rhoades, Reed & Rhoades the Los Angeles auctioneers, will pull off a big sale of live stock next Tuesday at Watts, a few miles south of Los Angeles. This will be one of the biggest sales of dairy cows in Southern California and will doubtless draw a large number of buyers.

Messrs. Rhoades, Reed & Rhoades are favorite auctioneers with many stockmen and are known as thoroughly reliable people to whom it is safe to tie.

The sale begins at 10 o'clock next Tuesday morning and will continue till the 100 dairy cows and twenty work horses, driving horses and implements are sold.

See ad. in another column for particulars.

A big bunch of Petaluma Incubators went up in smoke in San Francisco, but before another season comes around the big Petaluma Company will be stocked up as big as ever. You can't down a good incubator and the Petaluma is it. Meantime fire nor earthquake can not jar the Petaluma ad. out of the Cultivator.

Household Department

THE FARMER SAT IN HIS EASY CHAIR.

The farmer sat in his easy chair,
Smoking his pipe of clay,
While his hale old wife, with busy care,
Was clearing the dinner away;
A sweet little girl, with fine blue eyes,
On her grandfather's knee was catching flies.

The old man laid his hand on her head,
With a tear on his wrinkled face;
He thought how often her mother, dead,
Had sat in that self-same place.
As the tear stole down from his half-shut eye,
"Don't smoke!" said the child; "how it makes you cry!"

The house-dog lay stretched out on the floor,
Where the shade after noon used to steal;
The busy old wife, by the open door.
Was turning the spinning-wheel;
And the old brass clock on the mantel-tree
Had plodded along to almost three.

Still the farmer sat in his easy-chair,
While close to his heaving breast
The moistened brow and the cheek so fair
Of his sweet grandchild were pressed;
His head, bent down, on her soft hair lay;
Fast asleep were they both, that summer day!

Charles Gamage Eastman.

A COURTEOUS MOTHER.

During the whole of one of last summer's hottest days, I had the good fortune to be seated in a railway car near a mother and four children, whose relations with each other were so beautiful that the pleasure of watching them was quite enough to make one forget the discomforts of the journey. It was plain that they were poor; their clothes were coarse and old, and had been made by inexperienced hands. The mother's bonnet alone would have been enough to have condemned the whole party on any of the world's thoroughfares; but her face was one which gave you a sense of rest to look upon—it was so earnest, tender, true and strong. The children—two boys and two girls—were all under the age of twelve, and the youngest could not speak plainly.

They had had a rare treat. They had been visiting the mountains, and they were talking over all the wonders they had seen with a glow of enthusiastic delight which was to be envied. In the course of the day, there were many occasions when it was necessary for her to deny requests, and to ask services, especially from the oldest boy; but no young girl, anxious to please a lover, could have done either with a more tender courtesy. She had her reward, for no lover could have been more tender and manly than was this boy of twelve.

Their lunch was simple and scanty; but it had the graces of a royal banquet. At the last the mother produced three apples and an orange, of which the children had not known. All eyes fastened on the orange. It was evidently a great rarity. I watched to see if this test would bring out selfishness. There was a little silence—just the shade of a cloud. The mother said: "How shall I divide this? There is one for each of you, and I shall be best off of all, for I expect big tastes from each." "Oh, give Annie the orange; Annie loves oranges," spoke out the oldest boy, with the sudden air of a conquerer, at the same time taking the smallest and worst apple himself. "Oh, yes, let Annie have the orange," echoed the second boy, nine years old. "Yes, Annie may have the orange, because that is nicer than the apples, and she is a lady, and her brothers are gentlemen," said the mother, quietly.

Then there was a merry contest as to who should feed the mother with the largest and most frequent mouthfuls. Annie pretended to want apple, and exchanged thin, golden strips of orange for bites out of the cheeks of Baldwins. As I sat watching her intently, she sprang over to me, saying, "Don't you want a taste too?" The mother smiled understandingly, when I said: "No, I thank you, you dear, generous little girl; I don't care about oranges."

At noon, we had a tedious interval of waiting at a dreary station. We sat for two hours on a narrow platform, which the sun had scorched till it smelt of heat. The oldest boy held the youngest child, and talked to her, while the tired mother closed her eyes and rested. The two other children were toiling up and down the banks of the railroad track picking ox-eye daisies, buttercups and sorrel. They worked like beavers, and soon the bunches were almost too big for their little hands. Then they came running to give them to their mother. "Oh, dear," thought I, "how that poor, tired woman will hate to open her eyes! She never can take those great bunches of common, fading flowers, in addition to all her bundles and bags." I was mistaken. "Oh, thank you, my darlings! How kind you are! Poor, hot, tired little flowers—how thirsty they look! If they will only keep alive till we get home, we will make them very happy in some water, won't we? And you shall put one bunch by papa's plate and one by mine."

She took great trouble to get a string and tie up the flowers; and then the train came, and we were whirling again. Soon it grew dark, and little Annie's head nodded. Then I heard the mother say to the oldest boy: "Dear, are you too tired to let little Annie put her head on your shoulder and take a nap? We shall get her home in much better case to see papa, if we can manage to give her a little sleep." How many boys of twelve hear such words as these from tired, overburdened mothers? Soon came the city, the final station, with its bustle and noise. I lingered to watch my happy family, hoping to see the father. "Why, papa isn't here!" exclaimed one disappointed voice after another. "Never mind," said the mother, with a still deeper disappointment in her tone; "perhaps he had to go to see some poor body who is sick."

In the hurry of picking up all the parcels, the poor daisies and buttercups were left forgotten in a corner of the rack. I wondered if the mother had not intended this. May I be forgiven for the injustice! A few minutes after, I passed the little group, standing still, just outside the station, and heard the mother say: "Oh, my darlings, I have forgotten your pretty flowers. I am so sorry! I wonder if I could find them, if I went back. Will you all stand still and not stir

NECESSITY vs. LUXURY

The day has gone by when the farm telephone is considered a luxury—time was and not so long ago at that, when a telephone in a farm-house was looked upon as such. ***Today it is a necessity.***

THE WILLIAMS FARM TELEPHONE

has had a lot to do with bringing about this change, making it easy for the farmer to form his own telephone company at no great cost—keeping him ever in touch with his doctor, dealer, banker, freight-agent, and all others in a business way—to say nothing of the social side, putting him in communication with his neighbors at will. Think it over and write us for booklet "Over the Wire."

A Delightful Way to Go East

Is Via The

Scenic Salt Lake Route

Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City, thence ov r the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's

BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.

SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.

THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.

SALT LAKE ROUTE

THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.

DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.

EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.

EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:

May 25, 26 and 27—New Haven, Conn. Rate 92 10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50. St. Paul and Minneapolis, $70 00. St. Louis, Memphis and New Orleans, $67 50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.

Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returning.

T. C. PECK, A. G. P. A., Los Angeles, Cal.

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

from this spot, if I go?" "Oh, mamma, don't go, don't go. We will get you some more. Don't go," 'cried all the children. "Here are your flowers, madam," said I. "I saw that you had forgotten them, and I took them as mementos of you and your sweet children." She blushed and looked disconcerted. She was evidently unused to people, and shy with all but her children. However, she thanked me sweetly, and said: "I was very sorry about them. The children took such trouble to get them; and I think they will revive in water. They cannot be quite dead." "They will never die!" said I, with an emphasis which went from my heart to hers. Then all her shyness fled. She knew me; and we shook hands, and smiled into each other's eyes with the smile of kindred as we parted.

As I followed on, I heard the two children, who were walking behind, saying to each other: "Wouldn't that have been too bad? Mamma liked them so much, and we never could have got so many all at once again."

"Yes, we could ,too, next summer," said the boy sturdily. They are sure of their "next summers," I think, all six of those souls—children, and mother, and father. They may never again gather so many daisies and buttercups "all at once." Perhaps some of the little hands have already picked their last flowers. Nevertheless, their summers are certain. Heaven bless them all, wherever they are!

HELEN HUNT.

FOUNDING THE HOME

Having chosen a life companion and laid the foundation for a home, the aim of both husband and wife should be to make it a happy home.

This will require more or less of the giving up of self, of living self sacrifice, of yielding one to the other, of forbearing the hasty word of criticism or censure under trying circumstances. Yet, if the marriage relation was assumed as the result of true love, no sacrifice that one makes for the other will seem a hardship.

Self-sacrifice should not be carried so far as to become self-immolation—sacrifice does not mean effacement.

The founders of a home labor together for the good of the home, for the permanent comfort and happiness of the family. And if one is ready to bear all the burdens and all the privations, that one is doing both the greatest harm, and undermining the foundation of their happiness. Such a course will not only result in cultivating thoughtlessness and selfishness in the one who is too much shielded and favored, but also in the wrecked health and happiness of the one who is so unselfishly thoughtless of self as to thus jeopardize the interests of both and the home.

There should be a just and proper adjustment of the home work and responsibility. Because the husband works out-of-doors or away from home a certain portion of the day, should not free him from all duty indoors or when with his family. The average woman works in the home as hard as her husband does outside, and when he comes in has a right to expect him to share the indoor cares and responsibilities, especially the care of the children.

A husband and father who thus shares the care of the home and family ,always receives a warm welcome, enjoys the confidence of his children and goes to his work strengthened by the assurance of the love and appreciation of his efforts.

Compare the home of such a father with that of the man who takes upon himself none of the responsibilities of the home except that of its provider, where the wife is weary, overworked and discouraged, lacking his help, sympathy and encouragement, and the children indifferent save as they fear him, and say which yours shall be.

The rights of each as individuals must be respected if there is to be a continuance of mutual love and respect. The right to the person is a sacred right, and one that should never be invaded. And each has an equal right to the income, which, although it comes in direct response to the husband's efforts, is no less that of his wife; because by making her the keeper of his home and the mother of his children, he has taken away her earning capacity in the outside world, and she renders for him services that could not be secured in kind for any wage. It is, therefore, only right that she have an equal share of the income after providing for the needs of the family and home, to use as freely and independently as the husband his share. Where the wife thus shares the income she seldom cares to draw out her share if her husband is a careful manager, preferring to leave it as a common sum to be put by for a rainy day, or for a purpose in which both are interested. But it greatly increases her feeling of usefulness and her self respect to be considered her husband's partner in his business as well as in his home.

The management or mis-management of the children is the rock upon which many homes are ship-wrecked. Unless the parents are united in the course to be pursued in rearing and training the family, shipwreck is sure. If one is too lenient and the other too severe, the greatest harm results. The children run in terror and pain from one, for comfort to the other, and an entire lack of harmony and discipline results.

Neither parent should criticise the course of the other within the hearing of the children. If not agreed as to the course to be pursued, or if one feels that the other is unjust or unkind, it is better that the injustness and unkindness be borne rather than undermine the child's confidence and respect in either parent's judgment by criticism. Only sorrow can be expressed in such a case for the misconduct that required discipline.

In a quiet hour the parents should talk over the matter together and decide upon a future course in which each shall have the full confidence and co-operation of the other.

The best way to teach children to respect their parents is to let the children see by their daily example that the parents respect and defer to each other.—Farmer's Life.

"IS THE SHADE OF THE OLD APPLE TREE"

In the shade of the old apple tree, I've waited so long, love, for thee, that the voice I once heard, grows faint with each word, till it's barely a whisper to me. There is no more buzz left in the bee, the blossoms are withered, ah me!—and the tree that once grew where I waited for you, has changed to an old chestnut tree. In the shade of the old apple tree, where you hear the blamed buzz of the bee, with a big carving knife that I swiped from my wife, I am waiting and watching—by gee! Of daggers I have two or three and an ax and a cutlass, you see; and I'll stick all these things in the next guy who sings, "In the Shade of the Old Apple Tree."—Ex.

THE HOUSE CLEANING MICROBE.

This is the season of the year when the feminine members of the household are affected by a little microbe which now makes its semi-annual appearance. The disease is general and is usually worse in the spring than fall. This innocent little animal plays much havoc in all of our homes, it turns everything upside down and inside out. It causes the mighty lords of creation to groan in agony and long for the land where dust doth not corrupt or moths creep in and eat. The familiar name for this disturber of our domestic peace is the House-cleaner Microbe and since it is upon us it has seemed to me wise to suggest some ways and means for satisfying its insatiable appetite for cleanliness and change.

The house, for it is this material thing which gives lasting evidence of visitation of the Housecleaner, is of course thoroughly cleaned, windows, floors and every scrubbable thing within it scoured and scrubbed. This first demand of cleanliness being satisfied the second is that of decoration, the walls are tinted again or repapered. It is here that perhaps some practical advice may be given. Colors are often applied indiscriminately. If a few simple suggestions are kept in mind the results will be much more satisfactory. The window lighting and color of the wood work must largely govern the selection of color for the walls. A room which has north exposure should have a warm color on the walls for living or dining rooms, warm browns, terra cottas, yellow greens, or rich creams. If these rooms have east, south or west exposure, where there is much sun, cooler colors may be used, such as grays, cool greens and delft blue, the latter is a very attractive color for a dining room. The blue seems to give an added charm to all the china, especially is this true if any is displayed upon a plate rail.

For sleeping apartments these same suggestions regarding warm and cold colors hold true, but they should be in lighter tints, warm creams, yellows, greens and tans make very attractive colors for a bedroom. Light blue and pink are difficult colors to use for both are very cold in themselves but if placed on walls of south rooms the color of the sun largely counteracts the coldness of the color and they are attractive. Especially is this true if the woodwork is painted in white or cream. To have these attractive colors on the wall does not require much money or skill. Write to some large paint firm and ask for a color and for wall tints, they will also send you prices and if you ask they tell you the amount required for your rooms and furnish directions for using, then all you need besides the color is hot water and a brush, the latter costing about seventy-five cents or a dollar. These tints are powdered and are ready for use when hot water is added to them. They are put on as any calcimine and dry within an hour after being applied.

If the woodwork in the room is natural in color or stained darker, most any color will harmonize with it, but if painted great care should be taken to select a color which will be in perfect harmony. It is usually safer to select a tint or shade of the same color.—Mary Tanner Croswell.

An invitation is extended to our readers to contribute their experiences to this department. Inquiries answered.

WITH A SIEVERT OIL BURNER
You can burn 100,000 cubic feet of air with every 130 gallons of oil, this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

VULCANITE ROOFING

JUST THE THING ALL THE YEAR ROUND

Non-conductive of heat and cold. Does not buckle—lays perfectly smooth. A material which is at once light, strong, durable and cheap, and at the same time water-proof, wind-proof, acid and fume-proof. Also used for covering outside of buildings, floors of warehouses, offices, etc. Requires no paint; is permanent and inexpensive. Comes in various weights.

Samples and price list upon application.

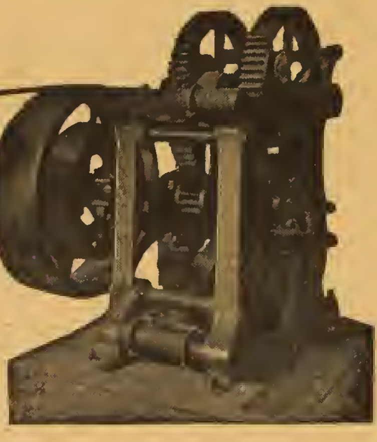
The Pomona Pump



☐ The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosph'r bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

L A. EXCHANGE NEWS.

The annual election of directors of the Los Angeles Produce Exchange held on Wednesday, May 23rd, resulted in the election of the following gentlemen: John T. H. Lewis, Louis M. Cole, L. J. Mathews, J. C. Richardson, John T. Allen, A. M. Klein, Lawrence Shorten .

A cow which had a good mother, and grandmother, is many times better than the poor one with a long pedigree. A pedigree attached to a poor cow is very poor property.

SOILS.

Syllabus of a lecture on modern scientific horticulture before staff of public library, May 2d, 1906. by C. J. K. Jones, A. M., Director of Study and Research.

SOIL—

I.—What is it?—(1) Derivation. (2) Nature of Rocks: (a) chemistry, (b) physical structure; i. e. in fineness; e. g. gravels, silt, etc.

II.—Functions of Soil—(1) Support of Plants. (2) Location of Food Supply. (3) Source of Water Supply. (4) Laboratory: (a) chemical, (b) biological.

III.—Treatment of Soils—(1) Cultivation: (a) tools, (b) season (c) crops. (2) Fertilization: (a) crops, (b) Fertilizers: 1. potash, 2.phosphoric acid, 3. nitrogen, 4. calcium. (c) Application: 1. surface, 2. sub-surface.

IV.—Irrigation—(a) Functions of Water: (1) soil solutions, (2) sap, (3) transpiration. (b) Root application. (c) Spraying. (d) Rotation to crops.

V.—Light and Shade—(a) Effect on General Health of Plant. (b) Effect on Fungi. (c) Effect on Insects. (d) Effect on Colors. (e) Effect on Fruit.

VI.—Heat and Cold—(a) Relation to Plant Geography. (b) Relation to Variety of Crops. (c) Relation to Production of Crops.

VII.—A Fertile Soil.

The Beck-Wakefield Co., agents for the justly celebrated Foos Gas Engine, were burned out in the San Francisco fire but have a large stock of engines at their warehouse and also a full line of their goods at their Los Angeles house. Prompt shipments can be made at any time. Write them for catalogue. Their advertisement in this paper refers only to the Foos Engine which for simplicity, reliability and economy is unexcelled by anything on the market.

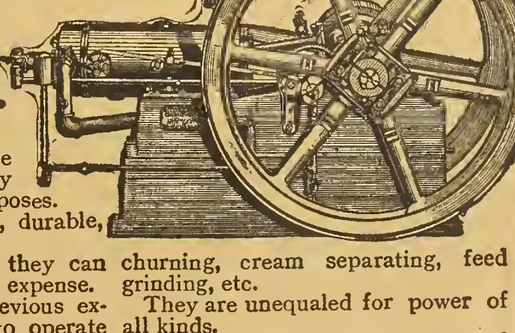
Gasoline Engines For Irrigating.



THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in **full, regular and long sustained power.**

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), **4, 6, 8, 10, 12 or 15 Horse Power.**

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

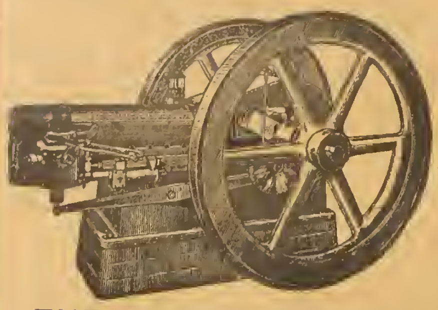
THE WESTERN GAS ENGINE



THE WESTERN ENGINE
Maximum Power at Minimum Cost

"From Factory Direct to User"

Designed and built by Western experts for Western use with Western fuel. In construction the Western embodies many original, yet practical ideas, which place it in advance of any other make on the market today. The simplest, strongest and best engine for

Irrigation, Power and Electric Plants.
Any Size from 5 to 500 H. P.

Burns cheapest fuel—gasoline, distillate or crude oil—with a saving of 20 to 40 per cent over any other style. **Send for Illustrated Catalogue** fully describing every detail of construction; tells **how** and **why** the Western excels all others; it gives the facts—the proof. Learn what Western engines are doing for others. Send your name today—ask for latest issue, A6.

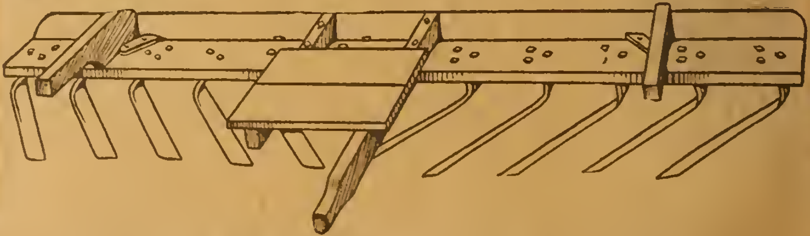
THE

Killefer Clean Cut Weeder



Is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. It does twice the work of any other tool with the same power. The knives overlap so it is impossible to miss any weed. Built in 6, 8, 10 and 12 foot sizes. The patented knives are so formed that they wear uniformly from heel to point, causing them to wear twice as long as any other blade for the same purpose. It is ***the*** tool for weed killing on any kind of cultivated land. Blades can be attached to cut in or out as desired.

LA GRANGE DAM

Source of water supply for Modesto and Turlock Irrigation Districts. Dimensions: Width at top, 327 feet; heighth, 127 feet; breadth at bottom, 83 feet; at top, 11 feet; 39,552½ cubic yards; 29,111 barrels of cement. Cost $543,164.-16.

While it must be admitted that scientific irrigation is yet in its infancy and is still new to America, this section has the best, the cheapest and the most reliable system known to the men of this continent.

The people, and not great corporations, own the water and the expense of irrigation is confined to the simple charge of keeping up the ditches, with their headgates, drops and flumes, in repair, and distributing the water.

FERTILE LANDS FOR SETTLERS.

Large tracts of land will be opened for settlement in the Yuma Indian reservation, according to information which has been received. J. B. Lippincott, supervising engineer of the reclamation service of the United States geological survey department of the interior, writes as follows: "Work is well under way at Yuma on the dams and the levees, and we expect to start construction of the canals in a few weeks. The time for the completion of the contract on the dam is July, 1907. The other work under the project will be timed so as to be finished simultaneously with the work on the dam. In the meantime, there will be no opportunity for obtaining water under government canals under the Yuma project, but there is a great deal of work to do both for laborers and mechanics in connection with this construction. We are also employing all the animals we can get in the country.

"On the California side all the land to be irrigated i. . the Yuma Indian reservation, which we propose ultimately opening, but the date for which has not been set. On the Arizona side most of the lands are either patented or claimed by various settlers. A great many of these claims, however, are of very doubtful validity.

"A water users' association has been organized at Yuma, the purpose of which is to contract with the secretary of the interior and also to handle the irrigation affairs of the community. There will be about 100,000 acres organized at Yuma. This land will be suited to the growth of all the different varieties of crops that are growing in tropical regions. The water supply is ample, soil very fertile and the climatic conditions permit of continuous growth of vegetation."

THE EGG PRODUCING HEN.

There is much controversy going on at present over the identical build of the hen that produces the greatest number of eggs during the year. Each poultry man has his own idea of what this form should be so that it is safe to say the argument is less important than we have been led to believe. The Standard, the guide book of breeders, prescribed a certain typical form and it is safe to be guided by this, at least to the extent of the size and weight of a bird at a given age. Beyond this it is seriously questioned if there is much in the idea that the hens producing the greatest number of eggs in a year are of a specified formation. We have worked on the plan of selecting our stock as nearly to the requirements of the Standard as was possible with fowls not bred for the show room. Then if any were plainly under size or showed any delicacy of constitution they were discarded. We have tried to breed so that the relation was not too close and from stock that had an ancestry noted for egg laying. We believe there is more in the question of proper size, proper vitality and proper ancestry than there is in shape.—G. C. Z.

Set the hens in a separate room from the laying stock where they will not be disturbed and where they will not hear much of the noise of the layers and they will do better work in hatching.

The roosts should be low, especially for large, heavy fowls, and should all be of the same height.

EGGS, 7c DOZEN

What Does It Cost You a Dozen for Your Eggs?

Wouldn't you like to buy a few thousand dozen of nice large fresh laid eggs for 7c a dozen?

And if you learn how to make eggs at a cost of 7c a dozen, it will be equally as good for you, won't it?

You know what the market price is for eggs today, and you know they will be higher after awhile—perhaps 30c, 40c, or even 50c a dozen. Well, if you can get good eggs at a cost of 7c or 8c a dozen, you can see a good chance to make some money this year—can't you?

The Lord helps those who help themselves—therefore, you must act, and do something for yourself when you read this. We'll show you how to make the eggs at a cost of about 7c a dozen, if you want them. How many laying hens have you got? How many eggs do they lay a week? What do you feed them? How much a day does it cost to feed them? Did you ever figure how much a dozen it costs you to produce eggs? Did you know that some feeds costing $40.00 a ton or more, will produce eggs at a less cost per dozen than the other feeds costing $18.00 to $20.00 a ton?

Every poultryman knows about how much a dozen he can sell eggs for, but how many poultrymen figure how much a dozen it costs them to produce these?

When you buy feed don't figure how many pounds or how many sacks you are going to get for so many dollars, but MAKE MONEY BY USING YOUR BRAINS—BUY THE FEED THAT **PRODUCES THE MOST EGGS.** The feed that makes the hens lay the most eggs with the smallest number of pounds of feed—figure how much a dozen you can produce eggs for.

INTELLIGENT MEN buy COULSON'S IMPROVED MASH EGG FOOD for their hens—and the other kind of men who haven't any brains, don't know enough to buy it, consequently, they are not making as much money as they might be making. You find them a slave in the world—have been ten or maybe twenty years struggling on and still a poor man. They have nobody but themselves to blame—they know it all; don't want to learn; never will learn—scoff at new ideas—and remain a poor slave.

* * * ** * *

You can produce eggs by feeding COULSON'S IMPROVED MASH EGG FOOD at a cost of 7c or 8c per dozen. For illustration:

Suppose a man has 1000 hens—a 90-pound sack of the IMPROVED MASH EGG FOOD will make the morning meal, as it is not necessary to add anything else to it. A sack of wheat, say 125 pounds, will make the evening meal. The IMPROVED MASH EGG FOOD will cost, say $2.00 and the sack of wheat about $2.00, making the feed for the day cost about $4.00. Now 1000 hens, fed on IMPROVED MASH EGG FOOD, ought to lay at least 600 eggs a day; that would be 50 dozen, so we say the cost would be 8c a dozen; in some cases, where they get 700 eggs per day the cost would only be 7c per dozen.

At the present time, with eggs selling at 17c and 19c per dozen, and as eggs go higher, you can see your profits of so much per dozen and you can see how much better it is to feed the BEST FEED; therefore it is **FAR CHEAPER** to feed the IMPROVED MASH EGG FOOD to your hens, where it only costs you from 7c to 8c to produce a dozen eggs; whereas it will cost you 10c, or 12c per dozen feeding other feeds. This saving of 3c per dozen on the cost to produce eggs inside of a year would mean a whole lot to you.

Eggs at 7c Dozen Earn $12.00 a Day

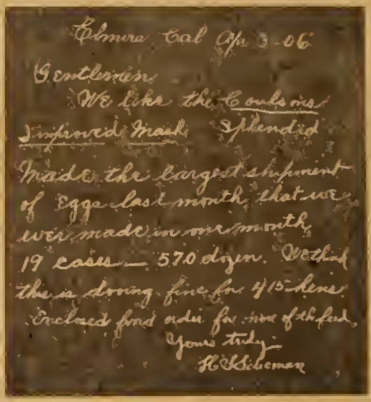
M. Sartori, near Tomales has nearly 2500 laying hens—he feeds them $2.25 worth of COULSON'S MASH EGG FOOD every morning, and about $5.00 worth of wheat in the evening. Total cost of feed, $7.25 per day.

These hens are now laying 105 dozen eggs per day, and sometimes more—by feeding them COULSON'S IMPROVED MASH EGG FOOD once a day, they produce eggs at 7c per dozen.

Mr. Sartori is now getting 19c per dozen, therefore he makes a profit of **OVER $12.00 a day** by feeding COULSON'S MASH EGG FOOD.

4 CENTS A MONTH to feed a hen Coulson's IMPROVED Mash Egg Food Every Day. Two eggs a month pays for the feed and when you get 18 to 20 eggs a month think of the money the hen earns for you.

Feed $40.10 —— —— Eggs $108.30



Elmira Cal Apr 3-06

Gentlemen

We like the Coulsons Improved Mash Splendid

Made the largest shipment of Eggs last month that we ever made in one month, 19 cases — 570 dozen. We think this is doing fine for 415 hens. Enclosed find order for more of the feed.

Yours truly

H. K. Schieman

325
Car Loads
of this feed, called COULSON'S EGG FOOD used in California during the year 1905

Don't you think it must be good? Used as a straight feed for the pullets and laying hens—for sale at Feed Stores.

Apple Growing in Northern California

By George N. Whitaker, Santa Rosa

As far back in history as the Garden of Eden, the apple and its fruit has ever been a source of praise. So much, in fact, has been said and written upon this subject that to enlarge upon it seems impossible. The heathen of the north believed that the apple possessed the power of conferring immortality. We, in our civilized times, know this to be an untruth.

To America, where the apple tree grows to perfection over a wider range than any other fruit, is due the greatest progress in its development. In the Northern, Middle, and portions of the Pacific Coast States, the apple is more perfectly naturalized than in any other section of the civilized world. During colonial times, the trees were principally seedlings, the fruit being used mostly for cider, which, being one of the principal drinks of the people, abounded on every table. As early as 1780 we have accounts of apple trees bearing as much as eighty bushels, which in our measure would be about sixty-five boxes. History speaks of apple trees measuring 16 feet in circumference and producing 120 bushels per year. I can remember a seedling apple tree at my old home in Iowa that was a strong, vigorous tree at seventy years of age and bore sweet apples. We have an account of apple trees in Pennslyvania which were 20 feet in girth and 58 feet in height, having a spread of top of 76 feet.

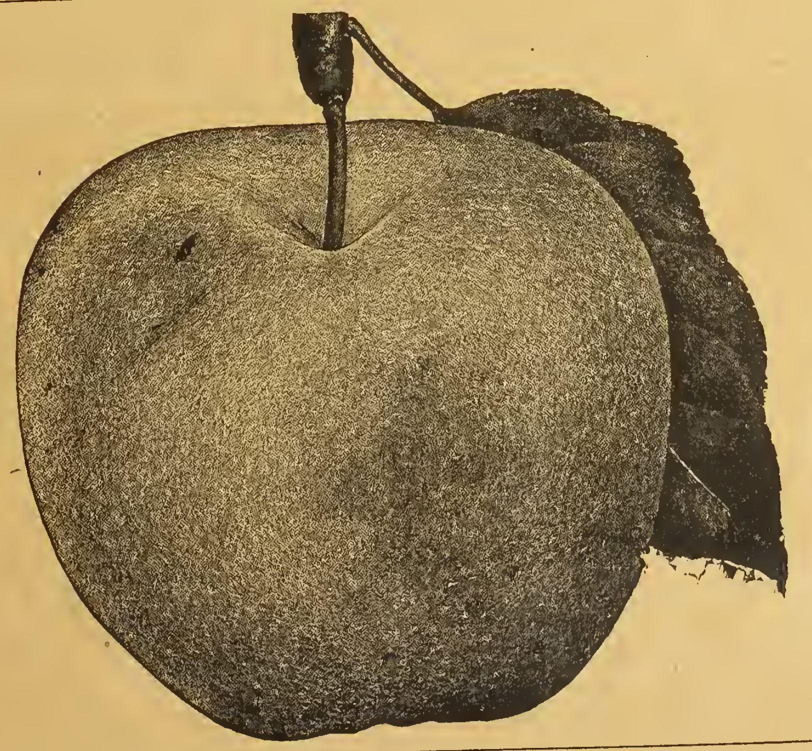
The export of apples from the United States in both the green and dried state is getting to be immense. The United Kingdom consumes over 5,000,000 barrels of green apples per year, over 75 per cent coming from America. In 1903, the United States exported to all countries over $5,000,000 worth of dried fruit. Every 14 pounds of dried apples represent 100 pounds of green fruit, so it can readily be seen what immense quantities in both green and dried state are exported.

Just what percentage of the export comes from California I can not say, but it is no small amount, I can assure you. I have seen in the London daily papers quotations of Baldwin apples which were shipped from California selling as high as $4.10 per barrel. I have also seen American Newton Pippins quoted at $5.30 per barrel.

At present Oregon and California are the principal exporters of green and dried apples on the Pacific Coast, and as soon as the Isthmian Canal is completed the Pacific Coast States will have an equal chance with the Atlantic States in the exportation of green and dried apples.

There are many sections in Northwest California, particularly Sonoma County, that produce as fine a quality of apples as any other part of the Union, and I venture the assertion that the farmers in Northern California having soil and location suitable to apple-growing will not make a mistake by planting good varieties of apples both for shipping and drying purposes. The climate and soil of Sonoma County are so varied that it would be hard for me to determine where a perfect apple could not be produced.

The qualities now in demand for an ideal apple may be summed up as follows: Bright color, good shape, uniform size, good shipping and drying qualities, and good keeping and good cooking qualities. With the present demand of the market a bright red apple sells the best. All things considered, the globular or round form is the best, as such apples pack closer and are less subject to bruises. Just how large the ideal apple should be, I can not readily determine. For general purposes, a medium-sized apple is the most desirable. Whether the size is expressed in weight or not, it is important that the size be uniform.



The richness of an apple consists principally in the proper proportions of acid and sugar. The average amount of sugar in our standard apple is about 8 per cent, and of acid is about 1-1300 per cent. Should an apple be deficient in either of these qualities we have an insipid apple; should acid prevail then we have a sour apple, and should sugar prevail, a sweet apple. For the average taste, the Bellefleur, Wagner, Rhode Island Greening, and Gravenstein have about the proper proportions of sugar and acid.

Flavor is a quality due to sugar and acid. Flavor and odor appear to be closely connected, and are said to be due to volatile oils and ether. Some varieties of apples possess a marked and agreeable flavor and add much to their value as a dessert fruit.

For drying purposes the skin of the apple should be thin, while at the same time it should be thick enough to stand ordinary handling and not break or bruise.

A crisp and tender-fleshed apple is always favored, although this tenderness should not be connected with sponginess. For all purposes the core should be small and well closed.

I do not know exactly what the cooking qualities of an apple should be, however, although I think it ought to contain an acid juiciness and an abundance of the substance which produces jelly when boiled. Sweet, juicy apples are, as a rule, the best bakers.

An ideal apple should have the quality of long keeping. This essential makes it the world-renowned fruit of the temperate climate of the United States. Apples vary in a wide degree in regard to their keeping qualities. It does not depend entirely on their firmness, but, as a rule, firm apples keep the best. The keeping qualities vary, however, according to soil, location, and climate. This marked difference will often be found in the same variety of apples.

The qualities noted above belong to the apple-separated from the tree. When united with the tree, there are two essentials that should not be overlooked. One is an eveness in ripening. For a good shipping apple, this is an important quality. The other essential is a firm adherence to the tree. It is a marked defect of some varieties to fall too early from the tree. These are the weaker points of some of our fall apples. Often some of our firmest adherents to the tree are so weakened by insects or fungoid growth that they fall before ripening. We often speak of such as wind-falls. But the true cause should entitle them to be termed worm-falls. When we have produced an apple that shall contain in the highest degree all the qualities which I have briefly noted we will not fall far from producing our ideal apple.

The apple, like all other productions of human skill and abor, is constantly advancing. Each step points to higher and better productions within our power of achievement. There are two scientific questions connected with the production of a perfect apple: First, the scion and stock should be as near as possible of the same growth and texture of wood, so as to be congenial to their growth; second, the soil and climate should be suitable to the healthy growth of the tree. The soil should contain certain minerals requisite to produce a well-formed and perfectly developed apple. An apple tree may grow and produce fairly good fruit, yet if it were on a stock more congenial to the scion it will produce better developed apples; the tree would be more vigorous, more profitable, would live to a greater age, and produce better keeping apples. I believe that this will be the next step in the advancement of the production of a more perfect apple than is grown at the present time. Apple trees become sickly owing to the scion and stock not being adapted to each other. Such trees are subject to all kinds of fungous growth and are liable to infect healthy trees and fruit.

To Sonoma County belongs the credit of growing the first apples in Northwest California. The Russians planted an apple orchard at Fort Ross about the year 1814. I visited that orchard in 1874. The trees were then over fiftv years old, and well loaded with apples which were rather under the average size. The trees were large and healthy. None of the present orchard pests had reached that lone orchard, but no doubt they are there now. Sonoma County in 1814 comprised all the territory west of the Sacramento River and north of San Francisco to the Oregon line. To Sonoma County, also, is due the credit of growing the first vines. At the time of founding the old Sonoma Mission the mission fathers planted the vine. But credit is due the early pioneers for the demonstration that the apple could be grown here in its most perfect state. In those days the ideal apple could be produced with but little labor. An apple tree in the pioneer days of Northern California, if on soil well adapted to its growth, was worth more than one acre of good wheat land. And at the present day apple-growing is the most profitable of all our horticultural industries. But it must be on soil best adapted to its growth. When the above rules are followed with proper care and attention the apple tree will respond with its delicious fruits as in the pioneer days of Northwest Caifornia.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

APPLES.

The United States Department of Agriculture has made extensive experiments with stored apples, determining the changes that take place chemically. Examination was made by microscope also. Nine leading varieties were tested. The results showed that there was very little difference between the changes of the composition between those apples kept in cold storage and those kept in common storage except that the latter changed in composition more rapidly. This is in accordance with experiments carried on by Prof. G. H. Powell in his shipping tests, that is the cold storage apples ripened much more slowly than apples not stored.

It was also shown that the less mature the fruit is when gathered the more rapid the changes tending to maturity after picking. It was found that mealy apples may contain as much juice as those which are not mealy. The difference being due to the separation of the cells of the flesh of the apple during the last stage of ripening.

* * *

EFFECTS OF RINGING.

A French scientist has experimented on the effect of ringing certain kinds of fruit trees, a practice sometimes put into use to promote bearing, pear and quince trees being used. The trees were three and four years old and part were ringed early in February before vegetation started and another set of trees was ringed three months later. Every two months after that part of the roots and branches were analyzed. With the pears, it was found that the roots of trees ringed in February contained more reserve material than did the roots of trees not ringed, while the stems contained less. After April it was found that the roots of the ringed trees were much poorer in reserve material than those of the normal trees. It is thought that the experiment shows that toward the end of winter and the commencement of spring the reserve material goes from the roots to the stem. From May to October the current of elaborated material is from the stem to the roots.

* * *

PRESERVING SMALL FRUIT.

The Station Record gives an account of the co-operative growers of New Zealand preserving their small fruits with an addition of an improved method. The fruit is placed in casks which hold from about three tons, the whole mass being stirred with beaters and at the same time sulphur-dioxide is forced in at the bottom and the gas is disseminated through the whole mass. The fruit thus treated is chiefly black currants and raspberries. It gives the fruit a bleached appearance but when it is boiled, the sulphur evolves "and the fruit reverts to a bright natural appearance." In making this jam, the fruit is boiled about twenty minutes before the sugar is added so as to drive off the sulphur.

Sulphur dioxide is made by adding strong sulphuric acid to copper and the result is copper sulphate (bluestone) sulphur dioxide and water. Sulphur dioxide has a strong affinity for water and is rapidly absorbed by it. This substance is harmless as it is composed of two parts oxygen and one part sulphur. It is a heavy gas and rapidly collects in the bottom of a vessel. The heat generated by the cooking drives the sulphur off and leaves the product pure but with a bright fresh color. The effect seems to be to prevent the oxidation of the fruit, which is the process that darkens preserved fruit.

* * *

PEAR BLIGHT.

Deane B. Swingle of the Department of Agriculture has spent the last month in traveling over the Sacramento Valley inspecting orchards and advising orchardists, and made the following statement regarding the present pear blight situation:

"In general it is too early to predict results for the entire season, but in comparison with the conditions of this time last year the amount of blight in the principal pear districts, as shown by blossom infections, has been greatly reduced where the last winter's campaign was thoroughly carried out. In orchards where the work was not well done the outbreak is, as we expected, very severe. It has not been our purpose to keep on the summer campaign, but as the growers are determined to remove those cases which have appeared, and as they are in some cases failing in some important details, it is necessary to warn them against expecting good results where these precautions are not strictly observed. Inexperienced men can never succeed in doing the summer work, and unless skilled labor of the highest class is obtainable the cutting should not be done, as it will do more harm than good. Three mistakes are being made by many who are undertaking summer cutting.

"**First**, cutting too closely to the blight. In the summer when the sap is flowing and the trees are active the germs are always working some distance below where they are visible to the eye, but some will not believe this until they have learned it to their sorrow. Every cut should be made from one to three feet below any visible portion of the blight. If this involves the removal of a large branch because of a blighted spur this should be done by all means, as the branch is surely doomed. It is folly to risk the life of a tree to save a few pears that will be lost in the end.

"**Second**, failure to disinfect. It is even more important to use the disinfectants in summer than in winter. Neglect in this respect will surely result in failure. Corrosive sublimate, four small tablets to a pint of water. It should be used on the shears after every cut and on all large wounds.

"**Third**, leaving cuttings in the orchard. These cuttings should be burned the same day that they are cut out.

"These details are absolutely essential, and to neglect any one of them is to fail. Those who do not observe them strictly are not following the Waite method of eradication.

"Skillful summer cutting and the observance of all precautions is saving many orchards all over the State; but the neglect of a single one of these precautions will be disastrous."

The opening of a portion of the Shoshone reservation in Wyoming, which is scheduled for some time this summer, promises to inaugurate a stampede of prospectors as well as settlers into that region.

PRUNING AND THINNING.

There is a prevalent idea that late pruning is injurious to fruit trees. All pruning is more or less an attack at the life of the tree, but if the limbs pruned are not too large late spring pruning does no injury. Some peach growers have lately put into practice the method of late pruning, to reduce the cost of raising a crop, for by the one operation both the pruning and thinning is done, and the result has bee quite satisfactory. A second thinning may be required in some cases but the work is greatly reduced through the first operation. On account of rushing work in spring the heavy pruning might be done earlier, at leisure; but trimming the small branches after the fruit has set gives an excellent opportunity for the proper thinning. An experiment was made at the California Station some years ago, comparing the regular hand thinning with the pruning and thinning combined. At harvest there was no difference in the size or quality of the fruit thinned in the two different ways, though by the late spring pruning method the fruit is necessarily grown more in clusters. Another advantage in this combination method is that a tree with a bushy top may have a better fruit set when there are slight frosts and when the time comes to do the spring pruning and thinning, the work can be so modified as to leave the most fruit should a short crop be threatened. Whether or not this plan is advisable will depend upon the individual case. Other spring work and the kind of fruit grown need be considered, but in many places it is practicable and reduces the cost of producing a fruit crop.

RUSSET OF APPLES.

No doubt many are aware of the cause of the drawback of the Yellow Newtown Pippin, viz., the amount of rust which seems to have increased from year to year at the stem end.

The U. S. Department of Agriculture, Bulletin 93, particularly speaks of the russeting on the said apple and according to their experiments they say, that it is advisable to use less bluestone and a greater quantity of lime in the preparation of Bordeaux mixture for application to the very young fruit.

The following is an extract from the above mentioned Bulletin which may be interesting:

"Russeting: The fruit on all of the trees that received the three early applications of the bitter-rot experiment on the Yellow Newtown apples developed russet spots or blotches due to the action of the copper. These blotches sometimes covered half of the apple, dwarfing the affected side. Usually, however, the spots were small and very irregular in shape, detracting little from the appearance of the apple.

"Fruits that did not receive these early sprayings were not affected, and the trouble seems to have resulted entirely from the two applications made to the young fruit on May 1st and 9th. About 50 per cent of the fruit sprayed on these dates showed some russet spots, but the disfiguration was apparently not sufficient to affect its market value materially. When russeting is feared it might be advisable to use less bluestone and a greater quantity of lime in the preparation of Bordeaux mixture for application to the very young fruit. The mixture used in spraying stone fruit (three pounds of bluestone and nine pounds of lime to 50 gallons of water) is suggested."

THE PRICE OF PRUNES.

A mass meeting of prune-growers in the Santa Clara Valley has voted, 75 to 6, to hold the price of the coming crop of prunes at the "basis price" of 3½ cents per pound. The six apparently desired to hold for 4 cents. The vote may be taken as an expression of judgment of well-informed growers as to what constitutes a fair price for prunes in view of the general outlook. It is a price which is fairly remunerative, one year with another, for orchards on good land, but would not, if contracts at that price could be made for a long series of years, justify the planting of orchards on land not of high grade. Considering the outlook 3½ cents is a fair price.

Dried Fruit Producers
Will save good money and much anxiety, by getting a
Pitting Machine
from **Briggs-Knight Mfg. Co.,**
336 East Second St. Los Angeles, Cal.

Plant Loganberries
For profit. We are prepared to purchase the fruit and, in fact, all kinds of small fruits, even if too ripe for other uses. If you have
Culled or Unmarketable Oranges and Lemons
it will be to your best interests not to sell to peddlers, but to dispose of such fruit to the
Sherman Concentrated Fruit Co.

Practical Farm Science

ACTION OF LIME.

Aside from its chemical action, lime when applied to stiff clay soils renders them more friable, easier to cultivate, and better able to supply moisture, heat, and air to the plants.

Its use improves the texture of sandy soils, making them more compact and better capable of retaining moisture and fertilizers. It may be stated here, however, that sandy soils will not bear heavy applications of lime as will the heavy clay soils.

What soils need lime. Most soils will respond favorably to an application of lime. If a soil is decidedly acid or sour, lime may be applied with a great degree of assurance that benefit will follow. Its application to heavy clay soils will usually prove advantageous. The use of lime on poor sandy soils requires caution. When added to such soils it renders the plant food in them available and tends to their rapid exhaustion. It is best in such cases to add liberal supplies of potash and phosphoric acid, and rotate the crops, using cow peas or velvet beans to supply the nitrogen and organic matter.

When to apply lime. In general it may be said that during the fall is the proper time for making application. If the land is sour, the application may be made just previous to planting. The same applies if only a small amount is to be used.

How to apply. In case quick lime is to be used, it may be placed in small piles at convenient intervals and a gallon of water poured on each pile. These should then be covered with earth to protect the lime from the air. The following day the lime should be spread evenly as possible on the land and immediately incorporated in the soil with a harrow. If lumps of unslacked lime remain, the land should be harrowed a second time after a few days.

It is important that the lime be thoroughly mixed with the soil and it should never be applied and turned under.

After screening the slacked lime it may be applied to advantage with a grain drill or a lime spreader if these implements are at hand.

PREVENTION OF SMUT.

Farmers are urged to treat all their seed wheat for the prevention of smut and thus save their wheat crop.

Formalin treatment is perhaps the easiest to apply and as effective as any.

Formalin can be purchased at any drug store.

Of late numerous inquiries have been received regarding the treatment of seed wheat for the prevention of smut.

The smuts are destrutive parasitic plants belonging to the class known as fungi. There are two classes of smut which attacks our grains, the stinking smut, or bunt, which attacks wheat only, and the loose smut which attacks wheat, barley and oats. The former can easily be distinguished from the latter in its having a very characteristic odor and destroys the kernel only, while the loose smut not only destroys the kernel but also more or less of the chaff.

If some of the wheat fields of the territory be infected with smut it is only a question of time until practically all our wheat will be so diseased. The spores of the smut are carried and blown about by the wind; they are also carried and spread by the threshing machine. This calls for co-operative and persistent work on the part of the farmers, as the work of only one or two farmers in a section will accomplish very little. If each farmer who raises wheat, whether it be much or little, treats the seed carefully it will only be a few years until our fields will be free from smut. This means much to the producer, as only a small per cent of smut makes the wheat practically worthless for milling purposes.

Treatment: Mix one pound of formalin in fifty gallons of water. Place the seed to be treated in burlap sacks and submerge in the solution for ten minutes. Dry the seed and it is ready for use. If the sacks be only partially filled it will be much easier to churn them around in the solution and get all the wheat in contact with it.

Copper sulphate treatment. Dissolve one pound of commercial copper sulphate in twenty-four gallons of water. Immerse the grain in this solution for twelve hours, after which place the seed in lime water by slacking one pound of lime and then diluting to ten gallons with water.

There are other methods of treatment, such as the hot water treatment and corrosive sublimate. But these are more difficult to apply; for instance, in the hot water treatment the water must be kept at a certain temperature, which is very difficult to do on the average farm; and great care must be taken with the corrosive sublimate, as it is a deadly poison.—John M. Scott, New Mexico College of Agriculture.

CONGRESSIONAL SEEDSMEN.

If the current custom of indiscriminate distribution shall indefinitely continue, if this congressional comedy shall drift into a continuous performance, we shall ultimately be driven to the mournful admission that we are not statesmen, but seedsmen; and it will be in order for some distinguished seedsman, some sainted hero of a score of memorable distributions, some legislative knight upon whose shield is blazoned a radish in its glory or a turnip in repose, to arise in his place with becomng gravity and move, Mr. Chairman, that the American eagle be taken from the mace and supplanted by a package of vegetable seed as the supreme emblem of the genius, the character, and the principal occupation of American statesmanship.—Morris Sheppard, of Texas, in House of Representatives.

CALIFORNIA'S AGRICULTURAL OUTPUT FOR 1905.

THE RUSSIAN THISTLE.

Several inquiries have lately reached us regarding the Russian Thistle. The State Horticutural Commission sometime ago issued a bulletin regarding the Russian thistle, which, by an act of the legislature the commission was instructed to take special measures to fight.

"In the first place," says the bulletin, "it should be understood that the 'Russian Thistle' is not a thistle at all. It is a tumbleweed and is somewhat related to our common American tumbleweed. It is annual, coming from seed each year, and in California makes it appearance in March and April. The first leaves are two small, tender shoots, about an inch in length, somewhat resembling grass blades. Between these seed leaves the true stem soon makes it appearance. This is lined with sharp, pointed, slender leaves, from the axis of which branches are soon thrown out. Its growth during the early stages is rather slow, and the plant, being then young and tender, is eaten by stock; horses, cattle and sheep devouring it eagerly. When about two months old the plant begins to blossom; it loses its tenderness, the stem becomes dry and rigid, with reddish stripes, the spines on the leaves become hard and the true leaves fall off. It has been estimated that a single plant of average size, from two or three feet in diameter, and weighing from two or three pounds at maturity, when dry, will bear from 20,000 to 30,000 seeds; while there have been found single plants weighing twenty pounds, with a diameter of six feet, which it is estimated, would yield 200,000 seeds.

This plant is especially adapted to California conditions, and should it obtain a foothold here would prove the most serious of any of our imported weed pests. It is well adapted to our arid conditions, maturing its seed early in the season, ready for the first north wind to start it on its journey of seed distribution. It takes complete possession of the land, crowding out other plants. Wheat, barley and oats all suffer from its effects, not only in the reduction of the crop, but in the lower grade of that which is harvested. Corn, potatoes, vegetables, and in fact, nearly all cultivated crops, are injured more or less, proportionately to their lack of care and cultivation.

"The plant is an annual, easily killed at any time during the growing season. It produces no seed before the middle of August or September, and the seed is short lived. In order to secure a complete extermination these two conditions must be fulfilled: (1) No Russian Thistle shall be allowed to produce seed. (2) There must be concerted action throughout all the infested area. If the Russian Thistle, wherever found, should be killed before it produces seed during three successive years, the pest would in all probability be completely exterminated; for the experiments already made indicate that the vitality of the seed is lost within that period."

As remedies against the weed in cultivated fields, it is said that spring crops should be sown as early as possible, so that they may get a vigorous start before the weed germinates; and the crops should be cut early before the thistle plants produce seed. The land should be plowed or the stubble burned immediately after the harvesting, and crops like potatoes and beets should be kept thoroughly cultivated as late as possible.

PAINTING FARM BUILDINGS.

The professional housepainter may suggest that the farmer or suburban home owner cannot do satisfactory work in this line, but if one has a fair degree of skill in the use of tools, and will follow a few common-sense suggestions from his local painter or others of experience, his work will compare favorably with that of the average housepainter and be a great saving in expense.

The two main objects in painting our buildings are to preserve them from decay and to add to their beauty. A coat of good paint spread evenly and thoroughly brushed into the walls and trimmings of our buildings will add many years to their durability and is a good investment aside from the added beauty that it gives them.

The best paint for preserving woodwork under all conditions is, without doubt, pure white lead mixed in pure linseed oil. Prepared paints of many kinds are offered by dealers, many of which are reliable, and being mixed ready for application, are largely used. But few of them are equal to linseed oil and lead paints and many of them contain little or none of these ingredients.

Some of the paints offered directly to the consumer are very good, and if one has not the requisite skill to mix his own, they are to be recommended. The water paints serve a good purpose, preserving woodwork for a short time, but in the end are not economical, as it takes as long to apply them as it would good oil paints and they last but a short time.

The value of any paint depends much upon how well the pigments or colors are mixed with the oil. These mixed at the factory are more thoroughly ground together than can be done by hand, yet if properly done, hand-mixed paints are nearly as good as machine-mixed. In hand-mixing white lead or any other pigment, only a small quantity of oil is to be added at a time. This is to be mixed until a perfectly smooth paste is formed, when more oil is added, until the proper consistency is obtained.

The art of mixing colors is a difficult one to master, but if only a small quantity of the modifying color is added at a time, and trials frequently made upon a surface similar to the one to be painted, very delicate shades can be obtained. If dry pigments or colors are to be mixed with oil, first make a rather thick paste and stir until it is perfectly smooth, then add more oil and stir as before. Dry colors should never be stirred into other colors, but first mixed by themselves, and then added to the foundation colors, a small quantity at a time. A careful estimate should be made of the quantity of paint that will be needed to cover the buildings with one two or three coats, as the case may be, and enough mixed at once to do the work, as it is very difficult to match any color that we may mix, unless it be done by weight or measure.

It is not best for the amateur to buy expensive brushes to be used but a short time and then leave them standing about until too hard for further use. Brushes of a large size, 2½ to 4 inches wide, are best for covering large surfaces, and the smaller sizes, oval or flat, for sash or trimmings. To keep the brushes soft from day to day, keep them suspended in linseed oil or kerosene. When not to be used for a long time, clean by working in turpentine and then rubbing and brushing on rough boards, brick or stone work until dry. Cleaned in this way, they will harden a little but can be put in condition for work by a litte pounding with a hammer. New brushes should be soaked in water an hour or two to prevent the bristles from coming out.

Thorough working in of the paint, filling up the cracks and holes and even spreading are the objects to be kept in mind. Paint should never be applied to a wet surface, otherwise it will crack off though mostly cracking or peeling is due to the paint being too thick. Parts that are most exposed, baseboards, mouldings, door jams and all joints, should receive first attention.

The first coat, especially if a long time since the building were painted, should be very thin. otherwise the oil will all be absorbed, leaving the almost dry coloring matter on the surface, and it will soon wear off. Two thin coats are much more valuable than one thick one.

It requires a little practice to get the knack of spreading paint evenly so that the laps will not show. To do this well, the brush should be dipped about the same depth every time, spreading the paint evenly over the same space each time and finishing by drawing the brush over the last space and across about one-half of the last lap where the brush is lightly lifted, and then dip again. The sash and blinds of most houses require quite as much care as the walls. A smaller brush and more skillful hand are needed for this work.

For country houses and outbuildings, moderate colors are in especially good taste. Shades of red, brown and gray, and tints of green or yellow, if not too pronounced, are especially appropriate. The house should have the brightest and most marked colors, the barn and outbuildings being less conconspicuous than the house.

In getting over the buildings to do the painting, great care must be taken that ladders and staging used are strong and well put in place, for many sad accidents have happened from the use of weak ladders and insecure stagings.

VALUE OF FARM PRODUCTS.

The year 1905 was a banner year for the farming interests of the country, and the products of the soil have added billions to the wealth of America. The secretary of agriculture, James Wilson, in his annual report estimates this additional wealth from the farms and plantations, north and south, east and west, at $6,415,000,000, the highest amount ever attained in any one year as the value of the crops in this or any other country. New high records as to value have been made by four crops—those of corn, hay, wheat and rice—though in amount of production corn is the only one that exceeds previous yields. The production of eggs and poultry has greatly increased also.

With the Citrus Growers

BY J. W. MILLS

REPLACING ORANGE TREES.

It is often desirable to reset an orange tree in a grove that has been planted several years and it is one of the most difficult things to make it take on a satisfactory growth. When an orchard gets to be twelve or fifteen years old, we doubt if it is desirable to reset trees singly. The roots of the old trees have already taken possession of the soil and they are using it to a more profitable advantage than a young tree can for years to come. It is a question of food and water supply and it will be found that in an orchard five to ten years old the roots of nearby trees are filling the soil around and beneath their neighbors. This being the case, the old trees will easily rob the young ones and make life miserable for them.

The best method to pursue is to fertilize the soil well in a large hole that has been refilled with fresh dirt. Make the hole at least three feet deep and as wide. A couple of cow heads from the slaughter house would go well in the bottom of the hole and a liberal amount of well rotted stable manure mixed through the soil that is used to refill. After the tree has been planted, it will be necessary to supply it and all the surrounding trees with enough quickly available fertilizer to supply the demands of all. A fertilizer rich in nitrogen should be used. It will be found necessary to give extra irrigations to the new tree. The tree should be carefully selected in the nursery, one that has made a strong growth and one that is not less than one year from the time the bud started in the nursery. Do not cut the whole top off but only the soft growth. Ball it in the nursery and let it stand in a shady place for a week, giving it a light sprinkling every day. Old sacks piled around the ball will keep it from getting dry. Do not allow it to get very wet, just moist enough to allow the top to keep its shape. This treatment is better than keeping it wet before planting or planting directly from the nursery.

* * *

THE SUBSOILER.

What has become of the orange orchard subsoiler that was being used so promiscuously and almost universally a few years ago? It seems to have had its day for a time at least. It was used to wonderfully good advantage at that time, in getting a crust that had formed in a great many soils broken so as to allow the water to penetrate. A great many groves are on soil that forms a hard layer just at the point where the cultivator and plow reach. It is almost impossible to get the water through this layer of hard soil and it cannot be done with a twelve hour run of water if the hard stratum is a couple of inches thick. The subsoiler broke this up and when it was done in the irrigation furrows the penetration by irrigation water was rapid and in some places too rapid. In some cases the water ran out at the lower end of the cut before it had time to soak sufficiently on the way down.

The subsoiler was used in many instances where there was absolutely no need of it. It became a sort of fad. During the last two years it has gone out of use entirely. This would suggest that it was really of little value at any time or it would not be dropped now. This is not the case at all. Conditions have changed during the past two years. It was known to careful observers that this hard layer apparently disappeared after the rainy season where it was of not much consequence and where it had been bad during the summer and fall, it was not so at the end of even our seasons of light rainfall. During the last two years we have had an abundant rainfall and we have heard very little of hardpan and "plow-sole" in the meantime. All these features seem to indicate that it is not altogether the plow and cultivator that makes the so-called "plow-sole". Mr. Frank L. Palmer who manages the Richards' estate, presented to us this view a few years ago. The last two wet winters seem to bear out his theory which is that the constant artificial irrigation that we have been compelled to practice is the chief cause. Soils that contain certain elements will be affected by this practice while soils that do not contain them are not so affected.

Another important feature that has been evident and is of greater importance than is commonly supposed, is the earth worm. During the series of dry years which Southern California went through, this little fellow was put out of commission for he cannot work in dry soil or soil that is not kept soaked long enough for the worms to propagate several generations during one continuous period. The longest wet spells of weather which occurred during the last two winters, afforded this opportunity. We know of one eighteen-acre orchard in Riverside which was easily irrigated wth a 25-inch head of water during the period preceding the fall of 1904. The ground in the grove, like other places, presented the appearance of a pepper box in undisturbed places. The worms worked below the surface in all shaded places or where it was sufficiently wet and as a consequence the first irrigation could not be accomplished with a 50-inch head of water during the same time which 25 inches did the work before. We were on the ground and saw these conditions.

SOIL STERLIZATION.

Professor Wm. Stewart, in the eighteenth annual report of the Vermont Agricultural Experimental Station, describes a system of soil sterlization in solid beds in the greenhouse, in which tomatoes and cucumbers were grown, that proved successful against nematodes. He says:

"Since the larger portion of the space devoted to these crops was occupied by solid beds, it was thought desirable to attempt sterlizing this soil in place. Three-inch (two-inch tile might have served, but were not at hand) drain tiles were sunk about ten inches below the surface of the soil. The lines of tile were laid every sixteen inches, each line being independent of every other, and connected with the surface by a vertical section of drain tile. The ends of each tile were plugged with paper and soil. The upright was connected with the laterals by a hole drilled through the upper surface of the end tile over which it was securely cemented. The verticals were connected alternately at one end or the other of the laterals, thus permitting live steam to be injected at opposite sides of the bed, and thus equalizing the diffusion of heat throughout the soil. Not only were the tile joints open, but each section of tile was perforated with a quarter to a half-inch hole through each side, the better to facilitate the escape of steam. Under a pressure of from 40 to 60 pounds of steam, a section of bed containing a surface area of nearly seventy square feet could be heated up to about 210° F. in approximately three hours' time. The surface of the soil being well covered with burlap, this temperature was maintained for a considerable period. In one case noted the thermometer stood at about 210° F. 24 hours after treatment. This procedure proved in every case an effective remedy against nematodes and obviated the labor involved in treating the soil in a box or other specially constructed device. The tile once placed lie so deep that they need not be molested in digging over the beds or in changing the soil, and are always ready for use in subsequent treatments of new soil. Then, too, the surface connected by means of vertical sections afforded ideal soil areation."

An experiment in sterilizing soil in place in sub-watered benches proved that it is not a desirable practice.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

EUCALYPTUS.

There are about 120 different varieties of this tree, over 40 already introduced in this State. The most common in Central California are E. viminalis, E. robusta, E. rudis, E. globulus, and E. rostrata.

From close observation and no little study during the past 17 years I find E. viminalis, or "manna gum," the most valuable for general purposes. This variety grows rapidly, splits more easily than other varieties (though none splits easily), and its fuel value at the age of ten years is about 85 per cent of that of oak. It should not be used for fuel much younger. It has a fine grain, and takes a high polish without any filler; will not be gnawed by stock; is the most hardy variety; will grow on pretty strong alkali soil; never sprouts up from the root, but will sprout up from the stump when cut down; and the bark, which this variety sheds at all seasons of the year, being of a resinous nature, makes excellent kindling, and can be easily broken with the hands.

All varieties of this tree are evergreens, but not good dooryard trees, on account of their leaves, which they shed every day of the year.

These trees should not have their lower branches trimmed off till they are five or six years old, as they grow out and droop to the ground, thus supporting the trunk, which, when trimmed up, has a tendency to grow any way except erect.

I have seen E. globulus in the Sacramento Valley killed by frost when E. viminalis was not touched in the same locality. It is the opinion of the writer that, in localities where the temperature falls below 20 degrees, and remains several hours the eucalyptus would be in danger of being killed, though some varieties might withstand such temperatures.

It is difficult to get some varieties of eucalyptus from the nurseries true to name, as they closely resemble each other, and the temptation to substitute is very strong. I should want to examine personally before purchasing. They will not grow from cuttings, but must be propagated from seed.

Timber from the eucalyptus rots in a short time if put in the ground, but anywhere else it will last as long as any common wood.

It is the belief of the writer that no other variety of forest-tree in Central California will equal E. viminalis to plant on our farms for profit, and I hope to see more large groves in the near future.

E. robusta, which blossoms in October and November, secretes the greatest amount of nectar I ever saw in any one flower, and the bees give it almost their entire attention.—J. C. M.

OUR NATIVE PENSTEMONS.

Every one who loves flowers at all, admires the beautiful wild-flowers with which our hills and plains are so abundantly bedecked. Almost no one cultivates them, and yet with the increase of population, and the rapid expansion of cultivation, they yearly are becoming harder to find.

It is different in Europe. If you look in the catalogue of any of the great Erfurt seedsmen you will find scores of our California plants. In England a seed-grower calls his seed farm "California," because he makes a specialty of Californian plants.

What is a Penstemon? If at present you see a shrub, or a perennial herb, bearing showy tube-shaped flowers, red, purple, or yellow, you may guess it is a Penstemon. If you wish to be sure you will have to go a little into technicalities. Pull it open, see if the immature seed vessel is pointed; now count the stamens; if they are five in number, and one of the five has no anther, you may be certain it is a Penstemon. These five stamens give it its botanical name, its nearest relatives having only four. The barren stamen is often densely bearded, which gives it its common name, Beard-tongue.

The flowers may be either narrowly tubular, like a scarlet honeysuckle, or widely tubular, like a trumpet flower. We have half a dozen of the narrow-tubular kinds, and all of them have red flowers. Two of them are shrubby, and they usually grow among bushes, where their long, slender stems can find support by scrambling over their more rigid neighbors. One of them has somewhat heart-shaped leaves, from which it takes the name of Heart-leaved Penstemon (P. cordifolius.) It has clusters of deep scarlet flowers; but those of the other are duller and smaller, and not particularly handsome. As its leaves are long and narrow, it may be distinguished as the Narrow-leafed Penstemon (P. ternatus).

The other red-flowered ones are all perennial herbs. The commonest, which grows everywhere on sandy plains, has a very narrow flower, and the upper leaves clasp the stem. I have heard it called 'Wild Honeysuckle;" botanists call it P. centranthifolius. On the desert side of the mountain there is another, very much like this one, but with flowers of brighter red, and somewhat wider. This is known as Eaton's Penstemon (P. Eatoni). You also may occasionally find in the canons on this side of the mountains, Bridge's Penstemon (P. Bridgesii), which you will recognize by its very narrow leaves, and somewhat woody-based stems. But the handsomest of the red species is the Long-lipped Penstemon (P. labrosus), known by its broader leaves, and the long lips of the flowers, the lower ones bearing a yellow beard This is common in the mountains.

There is but one yellow-flowered species, (P. antirrhinoides) the name meaning "snap dragon-like," and the resemblance is a close one. It is a good-sized bush, growing on dry mesas or hills, and flowering in early spring. The purple-flowered species are four, and their flowers are all ample, and not narrow like the red species. The most common species is the handsomest, and its name (P. spectabilis) indicates how well worth looking at it is. It is a foot-hill plant, and forms a small, soft-stemmed shrub. The flowers, which are borne in a fine panicle, are large and showy, with a beautiful metallic luster. There are two varieties, one blue-purple and the other rose-purple. The others are herbaceous perennials. One very beautiful species is quite abundant in some foot-hill canyons, but not in all. It grows in clumps and produces a great abundance of handsome flowers, either blue-purple or pink-purple in color, and its stems are somewhat woody at the base. Its botanical name is P. heterophyllus, but I hope some one has a good common name for it.

The other two species grow in the mountains, where one of them, Palmer's Penstemon, is common. It has very large flowers, light blue, with darker lines. You can make quite sure of it by examining the sterile filament, which has a dense yellow beard at the apex. The other mountain species is much rarer, and may be recognized by its deep blue, or violet-blue flowers, and the very slightly bearded filament. Its name, P. glaber, may be translated as the smooth-leaved Penstemon.—S. B. Parish.

THE HOME GARDEN.

Happy is he who has a home, though it be but four square walls; doubly happy is he, if the possessor as well of a strip of mother earth, that he may have a domain all his own; thrice happy is he, whose home grounds are bright with bud, and leaf, and bloom, rejoicing the eye of the passer-by and bringing happiness and content to the home of the inmates. The happiest days of the human race were spent in Eden's garden, and the nearest approach to an earthly paradise today is still the garden, embowered in Nature's richest green, and gemmed with lovely flowers and luscious fruits, where under one's own "vine and fig tree" one can rest or wander at will.

The ideal garden is one where there is something in bloom from the time of the snowdrops of earliest spring, to the chrysanthemum of latest autumn. The chief charm of the garden lies in the ever-changing panorama of leaf and bud, of bloom and fruit; the seeing of today of the first bloom of some rare and unknown flower; the beholding tomorrow of some old-fashioned blossom, dear from the days of childhood.

The ideal gardener will not cultivate one class of flowers to the exclusion of all others. He will find room in his garden for the gay bedding of plants that make gorgeous the long mid-summer days with their flames of orange, scarlet, and vermillion; he will find room also for the dainty for get-me-not, and the modest violet; room for the queenly lily and the fragrant rose; for gay tulips, and the sturdy perennials that resist alike the heat, drought, and rain; he will find room for palm and myrtle, canna and coleus, for shrub and vine; for all in short, that is bright and beautiful, or fragrant and refined. Such a garden is a delight to plant, a pleasure to labor in and a delight to look upon.

It is true that those with limited grounds cannot grow such a variety and multiplicity of floral treasures; but it is just as true, that most people could have more variety than they do if they would but put forth a little mental effort in planning and calculating. In thousands of homes now almost bare of flowers, all we have mentioned, and even more might easily be grown. Such a variety requires no more room than any good-sized yard will give.

A little calculation will show how many beds can be made and placed to the best advantage; along such a division fence a rose hedge can be planted, or a long border made for perennials; here a tree, a shrub, or a vine can be planted, a rockery built, a water-garden made.

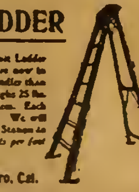
Probably no two persons would plan their gardens exactly alike, but this is an advantage rather than otherwise. There is a charm about a garden that expresses its owner's individuality, that is lost in those gardens which are copied from someone else's plans.—Lora S. La Mance.

Paper pots are a great boon to shippers of plants in pots. Knocked out of the ordinary pots and tied up in paper ones they are easily and safely shipped.

Petunias stand the sun well and make very desirable bedding plants for California. The improved strains are very handsome and should not be overlooked when allotting space in your garden.

Gunner—They say, despite their lethargicness, the people of Philadelphia are dead game sports.

Guyer—I should say they are dead-game sports. They still play ping-pong.—Chicago Daily News.



THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with [illegible] wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—30 cents per foot and prepay the freight.

Driver, Aber & Co., San Leandro, Cal.

SHADE TREES and EUCALYPTI

Also a fine variety of Eastern trees, such as Lindens, Maples, Horse Chestnuts, White Elms, etc., all well established in cans. Dracenas, Palms, Roses, Ferns, etc.

SYCAMORE GROVE NURSERIES

SAINT & WARNER 4584 PASADENA AVE., LOS ANGELES

In the Vegetable Garden

BY ERNEST BRAUNTON

POTATO CULTURE.

Perhaps no plant needs a good, rich soil, or pays for it better, than the Irish potato, and yet how many are there who are negligent in the selection and preparation of their potato ground.

Soil of a sandy loam nature is the best adapted for the growing of potatoes. The ground should contain an abundance of humus so that it will remain loose and mellow, thus giving the tubers a chance to grow. Virgin soil, old alfalfa patches or land on which an abundance of green vegetation has been plowed under will make good potato ground. Plow deep at least two times, the last time just before planting, and then thoroughly pulverize. Do not crop too often or use scabby seed, as the ground will become infected with the scab germ and potatoes produced will be unmarketable. Dipping seed potatoes in a solution of corrosive sublimate, 2 ounces to 15 gallons of water, for one hour and fifteen minutes will destroy any germs that may be on the potato.

Select seed of medium size, smooth and well formed. Letting seed remain in the sun for from four to six weeks will better mature them.

Cutting of potatoes is a subject on which a great many have different opinions. Some claim they have better success when cut in halves; some plant large pieces and some plant small ones. while still others tell of mammoth crops having been grown by peeling the potatoes thickly and planting the peeling. Although we have tried several methods our best success has been obtained by clipping off the seed end and cutting one eye to a piece.

The variety to plant depends largely on the market for which potatoes are to be used. For early market Early Rose and Early Clark are generally planted. For summer shipment to Colorado, Arizona, Texas and New Mexico, it is necessary to have a potato that is a good shipper, tough and firm, namely the Snowflake and Pearls. For a fancy potato, one that will take the place of the fancy northern Salinas in quality and appearance, the Burbank has proven itself the best.

Planting.—In the spring, plant at a depth of from 3 to 4 inches, and from 5 to 6 inches in the fall to keep seed from rotting. The rows should be at least three feet apart, and potatoes planted from 15 to 17 inches in the row. Before potatoes are up harrow thoroughly to destroy small weeds and loosen the surface of the ground. When about 3 inches high cultivate close and deep, as it is injurious to the plant to cultivate close after plant is large.

Spraying for blight.—As the Borreaux mixture is a preventive, not a cure, potatoes should be sprayed before blight appears. It is best to spray when the plants are about 5 or 6 inches high and at intervals of 15 days until the vines have received their growth. Five pounds bluestone and 5 pounds fresh unslacked lime to 50 gallons of water is the formula generally used.

Irrigation becomes a necessity when the natural moisture is insufficient to properly nourish the plant; but persistent cultivation will do away with a great deal of irrigating and thereby produce a better quality of potato.

Marketing.—Los Angeles almost always furnishes a good market for our fall grown potatoes, while Arizona, Texas, New Mexico, and Colorado generally take the surplus in the summer time.

It is very essential that we grow a fancy potato for our home market as the north can produce immense crops of poorer quality potatoes at a great deal less expense than we can, and it is only by growing fancy potatoes, which are always in demand at good prices, that we can compete with the north.

We should put up an article on which we are not afraid to put our name or brand. It is only the product that is put up right we can recommend to the wholesaler, and he to his customers, to be as represented, that command the best market, and many farmers make a great mistake in trying to run in a few inferior potatoes or chillis or whatever it may be, and thereby spoil the appearance of the balance.—Geo. L. Wagner.

CANNING TOMATOES.

The subject of canning tomatoes has been discussed by our growers in some sections, and a great deal of advice has been given on that subject, and communities condemned as not progressive because so many tomatoes were allowed to waste in the field. Speaking from contact with canning factories, this allowing tomatoes to rot is rather commendable than otherwise. It is not an easy matter to convert oneself from a tomato-shipper to a tomato-canner. It requires experience, skill, forethought and close economy to make it pay. The tomatoes must arrive at the cannery in a constant quantity daily, so that hands are not idle for want of tomatoes on the one hand, and on the other hand that the force may be able to work up all that comes in. Ripe tomatoes handled roughly and lying in large piles rot in a short time. Another consideration is that the plant in most districts would be idle for about eight months. As soon as we shall diversify our vegetable and fruit crop so there will be material to can and dry for eight or ten months in the year factories for these purposes will be established in more sections. This whole matter has been considered very carefully by persons of means with a view of engaging in this business, but it is yet too uncertain to warrant the investment of the required capital in the smaller districts.

CULTIVATING ONIONS.

"Tillage is manure," is an old and true saying, but in cultivating onions we must be careful that it is done properly. There are just two points to be kept in mind when cultivating onions; the first is to keep the weeds down, and the second is to conserve the moisture in the soil. The former of these is well understood by all gardeners and needs but to be mentioned; the second, however, is usually overlooked; many people recognize the value of working land during dry times, but do not know why it has the desired effect on the crop. At least an inch of lose soil should be kept on the ground as a mulch during dry times.

For hand cultivation the double wheel-hoe is undoubtedly the best machine now on the market. Whatever tool is used it should not penetrate more than an inch and in no case touch the bulb of the plant. In the onion-growing sections the land is too costly to permit the use of a horse, so the wheel-hoes are used exclusively.

The workers in the field should carry a bag with them to receive large weeds that may have been missed or allowed to grow to flowering size. All large weeds are carried to the edge of the field and thrown in a heap to rot. There are very few fields that are free enough of weed seed to grow a crop without hand weeding; this should be done with a knife, i. e., large weeds should not be pulled when growing in the row. For this purpose there are knives made, which may be obtained from most supply stores, but an old case knife may be bent up into good shape without costing as much. The point is turned up to lessen the danger of hacking into the plant as the hand works along.

The ordinary garden hoes do not work well in the onion field; a worn out one that has been cut down to one-half its width, so as to leave the corners obtuse, will work pretty well. All tools should be kept as sharp as steel will permit; a dull hoe will soon use up more time than would buy a new one.

TESTS OF VEGETABLES.

Olericulture, or vegetable gardening, is progressing, and to keep abreast of the times some little attention must be paid to it. During the season of 1894 the Horticultural Department entered upon this line of work for the first time.

The testing of the seeds of new varieties which seedmen and private individuals are continually offering in their attempts to find something better than we already have, is an important work, and one that requires labor and expense as well. In itself it is a very simple matter, but the average farmer and gardener cannot afford to spend his time and money on an extensive test.

SURE SEAL

Home canning of vegetables, meat and fruit made easy and certain by The Economy Jar

To give you an idea how easy it is to can fruits, soups, vegetables, meats, etc., in the Economy way—Note the wide mouth—how easy it is to put your hand in and thoroughly clean the jar. No rough seams inside or out to catch lint, chip into food or scratch you. After pouring the contents in hot and wiping rim of jar, clap on the gold-lacquered cap (acid-proof.) No screwing, twisting or prying. Just press the cap on gently. No bruises, burns, cuts or sprains when you use the Economy. Put clamp on top to hold cap in position while contents are cooling. The cooling forms a vacuum and holds cap on firmly. Jar is then absolutely airtight. Next day remove clamp, which lifts off lightly. If the food was cooked enough cap is held tight by vacuum, and contents cannot spoil, as no air can leak in. If cap loosens, contents were not cooked enough to sterilize, and can be heated again and saved. The Economy automatically informs you if contents are in proper condition to put away. When ready to use, puncture cap with can opener and pry off lightly. No sprained wrists, no unscrewing, no hands gashed by broken glass. No glass particles in food; no smelly top; contents fresh and sweet as the day you put them up. No separate rubber rings required. The Economy is the jar you will use with comfort and satisfaction year after year. There is absolutely no jar that looks like, works like, keeps like, seals like, or opens like the Economy. Using some other jar *cannot* give you any notion of what the Economy really is and what it really will do. Try the Economy for yourself. Ask your dealer for it. Send his name and we will send you, free, a booklet of recipes. Write direct to main office.

Intensive Farming.—The California farmer has not yet learned the value of his land nor will he until he has brought it under that intensive culture which alone will yield maximum results. Our farmers have too long been following the lines of least resistance, growing one crop continually, without returning any fertility to the soil, until we now have tens of thousands of acres which refuse to longer yield a profitable crop of wheat.

Our farms need dividing; land with such marvellous possibilities is too valuable to be farmed in large tracts. Our farmers must practice rotation of crops to preserve the natural richness of the soil. In addition to diversified crops he must keep a few cows, consume a part of his dairy, garden and field produce, which will go far to safeguard him against crop failures. He will not have "all his eggs in one basket;" such a course is neither necessary or desirable. Eventually, California will be one vast farming community instead of vast stretches of ranches miles in extent as is often the case in some sections. If we develop our possibilities to the fullest, gifted as we are with soil and climatic advantages second to none, we shall in time be known as the world's greatest and most favored garden spot. What we need is more scientific farming, not "book larnin" altogether but so much of it as will enable us to get the best possible results from an acre of soil, leaving far behind that "good old time farming" which depletes the soil of certain elements of fertility while leaving others unused. We must get away from those methods which impoverish both the farm and the farmer. To do this we must have each farm maintained at the highest possible point of cultivation and this is possible only with scientific intensive farming.

* * *

The Hay and Grain Crop.—Except for the damage visited upon our fields by the recent storm, California would doubtless have harvested the heaviest crops of hay and grain, acreage considered, that she has grown in the last decade.

Conditions for a heavy and satisfactory crop of hay have been present in nearly all sections throughout the entire season. Much of this crop was, most unfortunately caught in the field either in cock or swath, but a very small per cent being under cover. While the price per ton will be slightly less than expected, the crop will be enormous, the rains having no effect upon the total tonnage, and the outlook for a strong demand is all that could be asked.

Grain crops have not escaped so fortunately, and it is expected that the hay crop will be further swelled by a large amount of intended grain crops now impossible to harvest except as hay. From all districts reporting up to time of going to press, it appears the damage has been great. Some farmers have had their entire acreage laid as flat as though a band of elephants had marched over it. The rains came at a most inopportune time, for the heavy heads that the grain in all parts had developed, will prevent it from straightening up. Careful cutting will, of course, save a great deal; yet, if subsequent weather prove unfavorable, much of that blown down will be a total loss. As we were promised a demand unusually strong, it may be that correspondingly high prices will cover a large part of the losses now confronting our farmers throughout nearly all grain-growing sections.

* * *

Farmers' Organizations. — When we consider what a stupendous factor the farmer is in the maintenance and enrichment of our country, we cannot but pause and wonder at the complaints we so commonly hear, that he cannot obtain justice either at the hands of the buyer or transportation companies. It really seems that with proper organization the farmer might control the greater volume of the nation's business.

Let us see what he produces. Last year the American farm crops reached the astonishing total of six billion four hundred millions of dollars, an increase in a twelve-month of one billion five hundred million dollars. How stupendous these figures are can be guessed when it is known that all the gold mined in the world for the last four centuries could not equal in value what the earth yielded up to man in the past two years. These are plain figures—the comparison with the gold output may easily be verified by applying to the Agricultural Department reports—yet our farmers, as a whole, consider themselves helpless when confronted by a puny railroad with a rise in freight rates, or by an organization of buyers offering a reduction in market prices.

That farming, in a broad sense, is a remunerative business is proved by the fact that our agricultural lands have increased in value, in five years 60 per cent. To make life happy the tiller ot the soil has his telephone, his daily delivery of mail, and, in many cases, the railroad or trolley car to bring him to town. He is, in most lines, a skillful man and brings science to bear to outmaneuver the pests which are ever preying upon his field or orchard crops, yet from the persecutions and unjust discriminations of his fellowman, he is apparently helpless.

A business man speaking at an Eastern farmers' meeting covered the mooted point in the following terse speech:

"Unfortunately, or fortunately, as the case may be, we do not live in an age when crops will thrive and yield us an abundant increase with little effort and with disregard of modern and scientific methods. The successful farmer of today must study the nature of soil, intelligently select his seed and must better the standard of his live stock if he would be in a position to compete with the intense farmers of the wide awake agricultural sections.

"It is conceded that the success of commercialism depends upon the prosperity of the farmer. No man, or set of men, can create a panic as long as the farmer is prosperous. But it is only by intelligent application that he can become prosperous in a marked degree—it is only by his lending his aid to the movement of bringing about a community interest that he can resist oppression.

"Why should the farmer remain upon his farm, unmindful of what is going on in the world around him, while men in other walks of life are figuring his output to the bushel and are fixing the price to a cent?

"I take it that if the success of the nation depends upon the success of the farmer, it is to the interest of the country, as a whole, to give the farmer the opportunity to prosper. The success of the State and of the Nation depends upon an equitable adjustment of the business relation of the agricultural and commercial interests.

"When we realize that every other phase of life is organized for a mutual benefit it is a matter of wonderment that the farmers have continued so long fighting their battles alone. The farmer can never hope to attain that degree of success which is due him unless he comes to a realization of the fact that in unity there is strength.'"

Printers' Ink Says the Cultivator Leads

Has the Largest Circulation of Any Farm, Fruit or Stock Paper in the State

In its issue of March 28th, 1906, "Printers Ink," a journal for advertisers published at New York, printed a list of all papers published in California having a circulation in excess of 1,000 copies during 1905. From this list we give the following excerpts, which includes all Horticultural, Agricultural, or Stock papers rated by Printers Ink as having a circulation in excess of 1,000 copies each issue:

Los Angeles, California Culivator, weekly:

Copies printed: Have advanced from 3,916 in 1896 to 8,107 in 1903, 10,317 in 1904, and 10,699 in 1905. This paper is entitled to a place on the Printers' Ink roll of honor.

Los Angeles, Saturday Post, Weekly:

Copies printed: 5,471 in 1901, credited with more than 4,000 in 1903 and 1904, and with more than 2,250 in 1905.

Los Angeles, Live Stock Tribune, monthly:

Copies printed: This paper had credit for an average issue of 2,601 in 1901, since which time it has not furnished a report, but was credited with printing more than 1,000 copies for the year 1905.

Los Angeles, Rural Californian, monthly:

Copies printed: This periodical never furnished any complete and satisfactory circulation report, but had credit for printing more than 4,000 copies in 1900 and more than 1,000 in 1905.

Petaluma, Poultry Journal, weekly:

Copies printed: This paper had credit for an average issue of 1,163 for the year 1903, but has not since made claim to issuing so many as 1,000 copies.

San Francisco, Breeder and Sportsman, weekly:

Copies printed: This paper has never furnished a definite and satisfactory report but has had credit for issuing more than 2,250 copies for the years 1903, 1904 and 1905.

San Francisco, California Fruit Grower, weekly:

Copies printed: This paper has never furnished a definite and satisfactory report but has credit for printing more than 1,000 copies since 1900, including the year 1905.

San Francisco, Pacific Rural Press, weekly:

Copies printed: 8,861 in 1901, since which no definite and satisfactory report has been filed, but was credited (probably erroneously) with issuing more than 7,500 in 1905.

San Francisco, Live Stock and Dairy Journal, monthly:

Copies printed: 5,858 in 1904, and in the absence of any report had credit for printing more than 4,000 in 1905.

San Jose, Fanciers' Monthly:

Copies printed: This paper had credit for an issue of 2,400 in 1894, since which time it has not furnished a definite and satisfactory report, but was credited with printing more than 1,000 copies for the year 1905.

San Jose, Town and Country Journal, monthly:

Copies printed: 6,135 in 1903 and 9,125 in 1904. In the absence of a report was credited with printing more than 7,500 copies in 1905.

In a paragraph closing the list of papers, Printers Ink says: "It is not supposed that any California paper not named in the list printed above makes any claim, or has the past ten or twelve years made any claim to issuing regularly as many as 1,000 copies."

As Printers Ink is probably the best rating authority in the United States as to circulation it will be seen from the above the Cultivator is the only paper of its class in the Sate that has an actual average weekly issue in excess of 10,000 copies.

Advertisers can study the above list with profit.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Redlands reports a fine apricot crop.

Toluca's cot crop will total $30,000.

Hanford shipped apricots on May 20.

Solano county plums are on the market.

Around San Jose cherries are but half a crop.

Vacaville shipped her first peaches on the 21st.

Gilroy is making heavy shipments of strawberries.

Almonds and pears at Gilroy will be a splendid crop.

Ventura apricots are contracted for at 10 cents, dried.

Black Mission figs were ripe at Coachella on May 13.

Kings county shothole fungus is fast disappearing.

Marysville has shipped over eleven cars of cherries to date.

Napa county grapegrowers are being offered $30 per ton.

Julian apples escaped the late frosts and will be a good crop.

Four acres of apricots at Hanford sold on the trees for $500.

Sargent is making heavy shipments of Longworth strawberries.

Oakland takes all the Pajaro valley strawberries at $6 per chest.

Auburn reports that rain damaged small fruits, but helped feed.

Buyers are offering $25 to $35 per ton for cots around Redlands.

The Toluca fruit growers sold their apricot crop for $34 per ton.

Colusa reports the hay crop damaged by rain at least 50 per cent.

Late-sown grain will be the only crop benefited by the recent rains.

A Riverside grower realized $5.50 per half-box for 24-size grapefruit.

Hail did considerable damage to fruit trees about Redding last week.

The grapegrowers of Sutter county have organized to get better prices.

The Pomona Fruit Growers' Exchange paid $25,000 last week to growers.

An orchard of several hundred trees slid down into the river near Redding.

The Salton sea rose six feet last month and spoiled many valuable acres.

Vacaville has a new cherry of exceptionally large size, called the "Bassford."

The San Dimas Exchange is shipping twenty-five cars of citrus fruit each week.

Reports from Sacramento state that cherries and berries are badly damaged by rain.

All apricots now on sale in Southern California came from north of the Tehachepi.

Riverside gets the Southern California branch of the University Experiment station.

The grape growers of Sutter county have organized in an endeavor to secure better prices.

A car of San Jose cherries sold in Boston last week for $4960, or over 22 cents a pound.

W. H. Boucher, pomologist for New Zealand, is "nosing" over our State to learn all he can.

The cherry crop around Vacaville and Suisun will be a stunner unless the rain damages it.

Agents are in the field for apricot pits to be shipped to Germany as a substitute for almonds.

The Pajaro Valley Board of Trade received a gold medal for straw berries sent to the Portland Fair.

The Santa Clara grange reports on peaches: Muirs, good; Crawfords and Fosters, fair; Salways, a failure.

AGRICULTURE

Exeter farmers want 200 field laborers.

Chino has finished her beet planting.

Gilroy will have an enormous barley crop.

Hops are selling at Healdsburg for ten cents.

The hay-balers of Yolo county have organized.

A Hanford company will reclaim Tulare Lake.

Beans and beets about Las Posas promise well.

The Stockton potato crop will be enormous.

Hay experts say prices will be good for this season.

The cream of Kern county's lands are under water.

San Jacinto is shipping three cars of hay per day.

Red Buff reports immense damages to crops by rain.

Exeter reports great damage to grain from recent rains.

A Niles farmer says "hardly room enough to cock my hay."

Escondido reports grain rusting badly on account of fog.

Orange county shipped forty two cars of cabbages last week.

Cantaloupe picking in the Imperial valley will begin next week.

The first California apricots went East on May 15, from Winters.

San Fernando Valley will have a bumper crop of grain and hay.

The Whittier Vegetable Growers' Association organized last week.

Glenn county farmers will go back to reapers and binders this year.

Farmers about Healdsburg say the rain did more good than harm.

Olive, in Orange county, is shipping large quantities of cabbage.

Brawley is shipping large quantities of cucumbers to Los Angeles.

Escondido farmers are cutting heavily for hay because of no grain sacks.

Clarkston, Washington, is shipping lettuce and garden truck to Montana.

Twenty thousand acres about Imperial were sown to alfalfa last year.

The grain harvest for 1906 in the Imperial valley will be "the largest yet."

Hop prices for old crop have gone up on account of the losses in the Frisco fire.

The Reclamation Service will soon purchase machinery to use on the Klamath project.

Perris farmers were caught with most of their hay crop down when the rains came.

Washington and Oregon report crop prospects good, but most sections need more rain.

Near Petaluma some grazing lands are so badly cracked as to be dangerous for cattle.

Whittier gets the Southern California Pathological Laboratory of the State University.

The San Antonio Fruit Exchange received for its several associations $231,000 in April.

The San Joaquin river peat lands will yield the heaviest crop of asparagus yet harvested.

Hanford reports best crop of hay and grain, barring rain damage, they have had in twenty years.

Pullman, in Washington will hold a monster farmers' meet in June, when Secretary Wilson is expected.

J. H. Patton, of Highland, is doing his orange orchard cultivating with an automobile cultivator of 16-horse power.

G. J. Holloway, of Brawley, was the first cantaloupe shipper of 1906. About two acres of his went down New River.

Unreliable help is causing the large grain farmers of Central California to abandon the large harvesting machines for one man harvesters.

The express shipments from Escondido last week were 115 cases eggs, 2,700 pounds cream, 2,550 pounds butter, 2,008 pounds chickens and 2,610 pounds vegetables.

LIVE STOCK.

"Foul brood" of bees is common about San Diego.

Sheepmen in the North are jubilant over the late rains.

Lack of rain has run feed short in parts of Washington.

Piru beekeepers say a worm is eating the sage blossoms.

Wool about Marysville sold last week for from 22 to 28 cents.

Elsinore says: "Too much foggy weather for bees; honey crop light."

Feed for stock will hold for a longer time this season than for many years past.

The Sonoma County Poultry Association have contracted their eggs for June at 18 cents.

High water washed away many thousands of young fish from the hatchery near Redding.

Since the earthquake, cattle in the affected districts are easily frightened and may easily be stampeded.

The government has undertaken to superintend the introduction into this country of the sacred cattle of India for breeding purposes.

FARMERS' CLUBS

The Corona Farmers' Club met at the home of D. K. Wilson on May 21st. Two very interesting papers were presented. The next meeting will be held at the residence of the Platt sisters on June 4th, when it is expected by-laws will be presented and organization perfected.

The Covina Valley Farmers' Club met last Saturday at the pleasant home of Mr. and Mrs. R. J. Clizbe. The next meeting will be held at 2 p. m., Saturday, June 16th, at the residence of Mr. Robert Smith at Mountain View, on the Ruddock place, at the east end of the San Bernardino road.

FREE SEEDS.

The Congressmen can go on as usual, fondly deluding themselves with the belief that the seed appropriation solves the difficult problem of making themselves "solid" with the rural constituent. It would be highly interesting to know just who gets this particular something-for-nothing. One can travel far and live long in the country without ever running across a farmer who has more than heard of the Government's seeds, or who ever made an effort to get any of them. In the villages it is a little, but not much, easier to find a few packages of them. The idea that they affect either agriculture or politics to any appreciable degree never enters the head of anybody except the Congressmen and a few heelers. Why should it? There is no imaginable reason for supplying free seeds to farmers—no more than for supplying free hose or free straw hats or free pianos. The whole thing is wrong and disgraceful and corrupting—so far as it is not a mere miserable farce. There is nothing like a public demand for this use of the public money, and that it continues is even more humiliating than outrageous. The Congressmen will never learn this, apparently, until the farmers take the trouble to tell them that, like a too well remembered judge, that they are not now taking small bribes. They cannot do it too quickly.—N. Y. Times.

NOTED PLANTERS.

Trees were planted on the Capitol grounds at Washington by John C. Calhoun, Dixon H. Lewis, John Davis and Charles Sumner. Calhoun planted a live oak, Lewis an ailanthus, Davis a sugar maple and Sumner a Scotch beech. They all died except Sumner's Scotch beech, which not so much proves a "survival of the fittest" as that Sumner had special care bestowed upon it during his own lifetime.

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

FOR SALE—A FEW THOUSAND BLUE Gums, cheap to close out. Address L. Z. Huntington, Anaheim, Cal.

WANTED—WILD TURKEYS EGGS AT $100 00 per setting. Address only The Grace Glory Grounds, Brawley, Calififornia. Wilds of wild Turkeys (acclimated).

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

FOR SALE—OR EXCHANGE FOR TOWN or ranch near Los Angeles or north inland from coast, poultry and fruit ranch of 33 acres, shipping canning and drying fruits. All under cultivation and good improvements. Two hours' ride from San Francisco by cars, one mile from town. Address Box 64, Sonoma, Cal.

HEALTHFUL VEGETABLE COOKING oils, free from disease. Inexpensive. From corn, cotton and olives. Tiny samples 1c each. Also honey and olives. Address W. S. Ritchie Corona, Cal.

ARE YOU INTERESTED IN FRUIT CANNING? We have a book free describing six sizes of canners for the ranch or small factory, ranging from $10 to $125. Send postal with address for it. W. S. Ritchie, Corona, Cal.

TWENTY ACRES ORANGES, APRICOTS, walnuts and assorted fruit, 15 shares of water stock, cement ditch, good improvements. One-half mile from depot. Price $6,500 if sold before July first; half cash. L. B. Lauridsen, Route 3, Anaheim, Cal.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

PURE BRED SIRES.

Among the questions presented at the Farmers' Institute, that of the real value of pure blood in the stallions comes up often in this form: "Why is a full blood stallion worth so much more money to breed from than grade, if the grade is a fine individual?" Now, in a nutshell, the individual superiority of the grade animal is an acquirement of his own and has not been fixed as yet into type; he may breed true and he may not. He is an individual and after all the sum of the environments of all his ancestry and when they have been smaller animals, if he is of the draft breeds, his offspring may revert to their type. The pure bred draft animal has at least five generations of weight behind him, and the foal, if it has a reasonable amount of care is sure to inherit size from half of its ancestry. As the pure blood in its veins, if given a chance, is half of its inheritance, we may always be sure of a larger animal than its dam.

Study what is behind the stud animal; if breeding for speed, sum up the record speed of his ancestors and average them to see what he inherits. If a draft horse see what weight is behind him, then if he is an individual of health and strength and soundness, he is safe to use. In the draft stallions there are two pedigrees, one of a grade, the other of a pure breed, both ficticious — **RUFUS** (full blood). weight 1950; Sire, **Sir Clayton** (full blood), weight 1900; dam, Rosa, weight, 1600. **Roy** (grade), weight, 1900. Dam **Belle** (common mare), weight, 1200; sire, Blucher; weight, 1900; dam, Sallie; weight, 900.

Now the average weight of the six nearest ancestors of this horse figures 1575 pounds, so that while he might occasionally throw a foal that would be as heavy as himself, still he could not be expected to do better than make some general purpose horses, expressers and delivery wagon stock, a sort of misfit class.

Now, see what from a registered full blood we may reasonably hope to have:

FRANK (full blood); weight, 1900; sire, **Rufus**; weight, 1950; sire, Clayton; weight, 1900; dam, Rosa; weight, 1600. Dam, **Topsey**; weight, 1800; sire, Hubert; weight, 1900; dam, Fleate; weight, 1800.

An average of 1825 pounds per animal is the pedigree, or an average of more than 250 pounds in weight greater than the grade horse, and there are no light weight animals to revert to in the strain.

In cows, we also pay for the summed up value of the inheritance. If a bull is in the Advanced Registry he is worth more than though his inheritance were hit or miss. If his daughters have shown that they can make a required number of pounds of butter a week, the sire has a value above the common strains of the pure breed animals of his race. In the stallion the transmission of inheritance should be visibly true he should have the weight, appearance of his breed; a Percheron should be gray or black; a Clyde should be light bay or sorrel; a Belgian dark bay or brown. Do not patronize an off-color stallion. for if he is not from a sire prepotent enough to color him aright you do not have any assurance that he will transmit other breed characteristics. Now if you want bay offspring, breed to bay sires, but do not breed to a horse that has so little individuality that he has changed his own proper color and expect results.

The Cattle Association is fixed in regard to color. Though there are some times red and white Holsteins they never go into the herd book, nor do Herefords without a white face find entrance, no matter how well bred they may be. While the old saying is true that "a good horse may be any color," I have reversed that saying; it is "no good horse can have a bad color." Now the first is true of the animal as a worker, driver or pet, but all "off" when applied to breeding animals.

CREAM TROUBLES.

Editor Cultivator: I have a dairy of mixed cows, Jerseys, Shorthorns and Guernsey stock, and am having trouble in getting cream to raise. I know the milk is rich enough. We feed alfalfa, bran and corn meal. The milk is sold on milk route and customers complain that milk is not rich enough. Can you give me the cause and remedy?—E. S., Sierra Madre.

Increasing a cow's feed will not increase the richness of the milk. The increase of the butter received from the well-fed cow comes from increased flow, not increased per cent of butter fat in the milk. Test each cow separately with the Babcock test; there may be one or two cows giving two per cent milk in the lot, that reduces the entire output in butter fat. If you have not a Babcock tester, when the cows are milked, if each cow's milk is carefully stirred and poured from one bucket to another to thoroughly mix it, then take out half a tumbler full and set it in the glass in a cool place, when the cream rises you will be able to see the relative difference in the various cows' milk of the herd.

By considering four tablespoonsful as an ounce and then measuring the cream raised in proportion to the milk in the glass, by simple equation a weighing of the entire milk from that cow you can arrive at an idea as to which cows are giving too little cream in their milk.

Do all the customers complain? If they all do not, it may be that the milk is not well mixed in delivering it and some are receiving a skimmed portion while others are getting the top milk. See that it is well mixed if delivered in bottles before they are filled, or if it is taken from large cans stir it before removing each person's portion. Cream rises so quickly that there is a difference in two minutes time. The customer that receives the poor portion will let you know, while those receiving the richer portion will keep very quiet about it. So if only a portion complain this may be the cause.

I believe in a spade and an acre of good ground. Who so cuts a straight path to his own living by the help of God, in the sun and rain and sprouting grain, seems to me a universal working man. He solves the problem of life, not for one but for all men of sound body.—Emerson.

Sell, kill or give away the runts.

Hogs always do better kept in small droves.

Good pasture is the secret of hog raising.

MILK COOLER

See Our **"STAR"** Sanitary Copper Cooler and Aerator, complete with Seven-Gallon Tank,

CARROTS FOR HORSES

A farmer and stock breeder advises the free use of carrots in stock feeding. "Carrots," he says, "are so seldom advised in relation to stock feeding that it might almost be thought they were of little or no value as a food for stock, whereas the opposite is the case. For horses, more particularly, carrots are highly beneficial. It has often puzzled me why carrots are not more grown and offered for sale. A comparatively small quantity are decidedly remunerative and in excess of all other roots, but for stock feeding they are hardly to be found. On some soils it would be a mistake to attempt carrots, but where the soil is pliable and deep no crop is more easily grown, and if a big supply was put in the market then disposal would be easy and prices good. For home use a heap of carrots is most acceptable, as all kinds of stock consume them greedily, with good results.

"Carrots are often looked on as a kind of delicate food for sick horses. If a horse is out of sorts and off its feed, refusing almost everything and eating with the greatest indifference, and carrots are offered, they are eaten at once with much appreciation. They help to restore the appetite and give condition to the horse. In these respects carrots are invaluable and may well be looked on as safe correctives, but their usefulness extends beyond the period of sickness and depression, and horses in health may receive them frequently as a good food to maintain condition and activity.

"When first given their effect is a little laxative, but that is desired in many cases, and once given regularly they act as qualifying food. They are an excellent food for itching horses and all in bad coat, as they are cooling to the blood and give a gloss to the hair. Horses of all ages may receive them, including even the youngest backward foals, or the oldest and frail. Carrots should not be looked on as a mere addition to other or ordinary foods, but substitutes for them, as they are quite capable of acting as a real food."

MILK AERATION.

It has hardly been safe to advise the proper method of handling bottled milk. I have been criticized severely for advising against milk aeration during the past years. People are, however, slowly coming to know that the so- called animal heat or animal odor is nothing more or less than animal manure liquified in the milk. I saw two sample of milk this winter produced by J. W. Shattuck of Norwich, N. Y.; one was put through the aeration and bottling process and the other was milked directly into the bottle; both cooled and kept for 11 days. The first mentioned was fit to use, but showed signs of decay. The non-aerated bottle was as perfect as though milked the night before. It has been a slow process to educate people to understand that air contaminates milk. Men who are producing certified milk have learned to keep the air in the stable as free from dust as possible and to protect the milk after it was milked from air contact unless in a room that had been made as nearly as possible free from germ life. Now the average aeration of milk is an abomination, because the air is laden with germ life, and the aerator is not half the time clean. The way to care for milk is to milk it as cleanly as possible protect it from the air and cool it as quickly as possible, and keep it cold. Don't however, try to cool a large body of milk without stirring it, and so have the mass partly cooled and partly warm. Stir it enough to have the whole body uniform.—H. E. Cook.

POINTS OF A GOOD DAIRY COW

L. A. Sweet, a very successful dairyman of Minnesota, addressed the annual meeting of the Minnesota State Agricultural Society a short time ago and related some facts gathered from his experience with dairy cattle. We quote in part from his address what we consider valuable experience:

"In the rearing and breeding of the dairy cow, several things in her individual make-up should be taken into consideration. In the first place her pedigree should be good, that is to say, her dam, her grand dam and her great grand dam and farther back if possible should be individuals of large performance, then she should be as near a perfect individual herself as possible; that is to say, she should have the ideal dairy form. What is the dairy form and how can it be improved?

"The cow with the ideal dairy form should be heavy in the middle, in other words, her digestive tract should be very large in proportion to the body. She should have a large pair of lungs, being wide on the chest and having a large nostril. These indicate that her breathing is full and deep, and the chances are, if she has a good large, sound pair of lungs, she will have a large, active heart, a large digestive tract to store away and digest a great amount of rough feed, a good strong heart to circulate a heavy flow of blood, and a large sound pair of lungs to purify the blood with, all working together in unison, with a large, well-developed udder for the accumulation and secretion of the milk. All are vital points. The udder is supplied for its milk secretion by a heavy flow of blood which is indicated by the milk veins and the size of the veins where it passes into the abdominal wall. The spare build of the cow, showing no surplus flesh to require an extra amount of feed for bodily maintenance, and the bright, prominent eye; also the soft, mellow skin and the thin hair, are all points that indicate the make-up of a good dairy cow."

STOMACH WORMS OF SHEEP.

It is during the summer months that loss from the twisted stomach worm of sheep occurs, and flock owners should early endeavor to prevent their flocks from becoming diseased. Healthy adult animals seldom become affected with this disease, and the greater part of the loss occurs among young and weak animals. However, if the conditions are favorable for the sheep to become infested with this parasite, the death rate among the mature animals is also heavy.

This disease is not as difficult to treat successfully, as is generally believed. The preventive treatment is very important. It is based on keeping the sheep in a healthy, vigorous condition, and among surroundings unfavorable for the entrance of the eggs or larvae of the parasite into the digestive tract or the feed. Drinking surface water and permanent pastures, especially if pastured close, are favorable for the production of the disease. The preventive measures that are most practical to use under the local conditions can be judged best by the person in charge of the flock, and the success of this part of the treatment will depend on the precautions that he deems necessary and the thoroughness with which they are carried out.

Sheep raisers, who have lost sheep from this cause in former years, should not wait until the disease develops in the flock before using medicinal treatment. The following mixture is recommended by Dr. Law, and has given excellent results; arsenious acid one dram, sulphate of iron five drams, powdered nux vomica two drams, powdered areca two ounces, common salt four ounces. This mixture is sufficient for 30 sheep and can be fed with ground feed once or twice a week. In case the symptoms are already manifested, it should be fed once a day for two or three weeks. In giving this remedy in the feed, the necessary precautions should be taken, or each animal may not get the proper dose. Turpentine is largely used in the treatment of stomach worms. It is administered as an emulsion with milk (one part turpentine to sixteen parts

of milk). The emulsion should be well shaken before drenching the animal. The dose is two ounces for a lamb and four ounces for an adult, and to be effective should be repeated daily for two or thre days.—R. A. Craig, Veterinarian, Purdue University.

FALL FRESH COWS MOST PROFITABLE.

Much has been written upon the best season for cows to drop their calves. Opinions still differ, and by far the greater number of milch cows are allowed to follow the most natural course, and either by indifference or intention they "come in" in the spring. The producer of milk for sale, if he has an even trade, may want to have about an equal number of fresh cows every month in the year. If the bull is kept up and service controlled, this can be regulated as a rule, although unpleasant irregularities in breeding will sometimes occur and stubbornly resist correction. But if the prime object is to produce the greatest quantity of milk of the best quality and at the greatest profit from any given number of cows within a year, the evidence is overwhelming that the cows should be managed so as to calve in the autumn months. For like reasons, September is the best month, in most parts of the country, for a heifer to drop her first calf in order to best develop as a cow, and this almost regardless of the age of the animal at first calving. Calves born in the fall are easier reared and make better cows than those born in the spring or summer. It seems needless to rehearse the stock arguments on this subject, based upon the long experience of successful dairymen, but a brief recapitulation may be useful. The cow or heifer calving in the fall needs the most healthy and nutritious pasturage just following the strain and while coming into full flow. Just at the time when some falling off is likely to occur, the animal is brought to the stable and receives good care; the winter feeding and the returns from it may be depended upon to exceed the midsummer results for any like period. At the stage of milking and of gestation, when another dropping off in the milk yield may be looked for, the fresh pasturage induces a fresh flow, lengthens the milking season, and increases the year's total output. December and January are good months in which to control and supervise the service of the bull. Midsummer and the dog days are a good time for the cow to be dry and preparing to calve again, and a most unprofitable and annoying time to make milk or handle it. With fall fresh cows the greatest product and the richest comes at a season when milk and butter are always comparatively high in price. In actual practice four fall fresh cows have been found equal to five which calved in the spring, in twelve months' product, and at about four-fifths the cost.—Farmers' Bulletin No. 55, U. S. Department of Agriculture.

AUCTION

Thursday, June 7th, at 10 A. M.

Seymour L. Watts Will Sell at His Ranch at

Morton Station

On Santa Ana Electric Line,

54 Head Milk Cows

1 Holstein Bull

All fine big cows and milkers. Graded Holsteins, Durhams and Jerseys and in excellent condition; carefully selected herd for milking strains. Mr. Watts is going entirely out of the dairy business and will sell every head regardless of value.

TERMS—6 months time with approved security. Lunch served.

Rhoades, Reed & Rhoades, Auctioneers

Office, 730 So. Spring St., Los Angeles.

Grand Auction

Friday, June 8th, 10 A. M. Sharp

At Raitt's Banner Dairy Farm, 2½ Miles South-West of

Santa Ana

Take Santa Ana electric cars to Fifth street crossing, Santa Ana. Teams in waiting.

200 Cows 15 Horses

This Herd consists of 100 head of Jerseys, 100 head of Holsteins and Durhams. 165 head of these cows are now milking, balance coming in soon. All large milkers and test high. Healthy and in good condition; in fact, one of the largest and best herds in Southern California, the result of 10 years of careful breeding and culling. A certificate of health will be furnished, so that this stock can be removed from the county if desired. Owner invites prospective purchasers to call at the ranch and see these cows milked and tested before sale.

2 Registered Jersey Bulls, 1 Durham Bull, 2 Holstein Bulls.

15 head of Work Horses and Mares, weighing from 1000 to 1500 lbs. each, from 4 to 10 years, all general purpose stock.

Implements—Milk Wagons, Plows, Harrows, Seeders, Corn Planters, etc.

Barbeque at noon.

TERMS 8 months time will be given with note and approved security. Three per cent discount for cash.

On account of quitting the dairy business, I am making a genuine closing-out sale, and will absolutely sell everything to the highest bidder; no reserve.

DIGESTIBILITY OF MILK.

The Minnesota Agricultural Experiment Station in experiments on The Digestibility and Nutritive Value of Cottage Cheese, Rice, Peas and Bacon, St. Anthony Park, Minn.

The experiments taken as a group show:

That cottage cheese prepared from skim milk and enriched with cream is a cheap, digestible and nutritious food, and when the materials for its preparation are produced on the farm it is one of the most economical foods that can be used. At two cents per quart for skim milk and 35 cents per quart for cream cottage cheese compares favorably with meats at 11 cents per pound.

The actual digestibility of rations in which milk is used is higher than the calculated digestibility of the individual foods, showing that, when combined with other foods, milk exerts a favorable influence upon digestibility.

That lean bacon in a ration supplies a large amount of digestible nutrients and available energy. Over 96 per cent of the bacon fat was digested and absorbed by the body. Lean bacon contains as much protein and about twice as much digestible fat as other meats, making it the same and even at a higher price per pound a cheaper food than other meats.

JUST WARTS.

Editor Cultivator:—In your paper of May 18, 1906, there is a question in regard to warts on cows and a remedy was given. But I have tried another remedy which seems to me easier. We have a heifer which had warts on her ears last year. We rubbed on fresh lard on the warts a couple of times and in about two months or so, the warts dropped off.—Subscriber Kingsburg.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

INTERROGATE NATURE.

It is nice to be home again! But I do enjoy the Farmers' Institutes, there is so much to learn at them from all the topics discussed there. It is so wonderful too, to compare the treatment of the soil, the crops, the cows, in fact, everything to the treatment of fowls! Wonderful to learn that even the soil has to be fed "balanced rations" as a "chicken crank" might call it, or as Mr. Mills asserted, you cannot keep on taking a crop off the land without returning an equivalent. "Allee samee" with the hens, you must feed them the elements of the egg if you want them to bear fruit in eggs.

Then the "cowman" Professor E. W. Major's discourse on the varieties of cows, and of the difference in handling the different breeds is most helpful to the chicken crank, for hens with their different breeds require similar care in handling.

The question "Is a cross between a Jersey and a Holstein likely to prove good?" comes at almost every Institute. This brings the Professor to his feet and with inimitable patience, he explains the difference in the milk of the two breeds, the Jersey giving a small quantity of very rich milk, the Holstein a very large quantity but not nearly such rich milk. The object of a cross would doubtless be to endeavor to get a cow with the good qualities of both breeds, but unfortunately this does not always result, in fact it more frequently happens that the bad qualities of each side predominate, that is the cross gives as little milk as a Jersey and of as poor a quality as a Holstein. To take two breeds of cows, horses, pigs, hens that have been bred for generations for special purposes, fed in a special manner, and cross them, unless for the purpose of creating a new breed, which will take money, patience and many years or even generations to perfect, seems a foolish and useless undertaking. "Allee samee" with hens!

But to return to our subject of interrogations, some of the questions asked and discussed bring out new ideas which are very helpful to the farmers and are one of the salient points of the Institute.

I think in the fourteen institutes I have attended during this year at least two hundred questions have been "fired" at me, I really feel as if I am fairly wrestling with interrogation points.

In these two hundred (roughly estimated) questions, more than half have to do with the raising of little chicks and what causes the great mortality among them.

I have frequently written about the causes of mortality in little chicks, especially in brooder chicks, and have noted with sorrow what a serious loss this is to poultry breeders all over the country. Now there must be some

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

200 Eggs a YEAR From One Hen

CAN YOU show this record? How many possible eggs have you lost—eggs which you might have had—if you had been using a feed which had been tested for you.

A Feed which makes a 200 egg Hen out of a Scrub, and makes a 200 egg Hen lay 225 to 250 eggs a year. Figure it out.

How can you afford to make expensive personal tests, when

PURINA POULTRY FEEDS

will bring out every egg your hens are capable of laying. A feed which will bring EGGS in Winter as well as in Summer—40c Eggs as well as 12c Eggs—from ALL your hens.

And you don't have to take our word for it, either—just try PURINA FEED at our expense, and believe the evidence of your own senses—that's all. It won't cost you a red cent to prove us right or wrong.

If the results don't come, just tie up the bag and write us, and we will return every penny of your money and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct FREIGHT PREPAID and the feed used in testing costs you nothing. This is the Money Back Line—Write today for particulars about our FREE TEST Plan.

cause or reasons for this, what shall we do about it ? I think it was that wise man Lord Bacon, who said, "When in doubt consult Nature." Nature is our great and wonderful teacher, suppose we interrogate Nature on this important subject, and see what she advises, or does.

To begin with we will confess that the nearer we can come to Nature and the closer we can imitate her the greater will be our success in raising chicks.

First, when does Nature hatch and raise her young fowls and birds? In the spring or early summer! Well, we do not want to hatch only at one season of the year, what then must we do? Duplicate the conditions of springtime, as closely as possible.

First, as to food. Now this is very important. What food does Nature supply for her young fowls in the spring and how can we most closely imitate her food, if we cannot supply it exactly? Does she give them grains of corn and wheat? Where are her grains? Nearly all buried! Nearly all sprouting! So she gives her chicks the tender green, that they have in abundance all around them everywhere. What else? Grubs, worms, insects, ants eggs, and larvae of all sorts. These they have to hunt for, and if they scratch and work for them they get them, but they have to run and scratch, they cannot gobble a full meal in ten minutes and then have the remainder removed. Now we can supply the green food if we try, and I notice that those who give their chicks all the tender, spring-like green food that they can eat are the people that are called "lucky" with chicks, their chicks are healthy and vigorous, and do not fall victims to the ills that chickens are heir to.

UPPER.—Black Orpington Cockerel, 1st prize at San Francisco; and Black Orpington pullet, 1st prize at San Francisco and Los Angeles.

LOWER.—Buff Orpington cock, 1st prize at San Francisco.

Bred and owned by Percy L. Harley, Redlands, Cal.

"Be sure you remember to show me the place if you see an ants nest," said the gamekeeper's wife to me when I was a child, "I want their eggs for the little pheasants."

"I have found an ant's nest and the ants are airing their eggs!" was my delighted announcement soon after, and I vividly remember going with the good woman to gather ant eggs to feed the baby pheasants, and my surprise at the ants airing their eggs. I was told later on that the wise ants knew the children in the eggs needed fresh air to make them hatch, another thing in which we would do well to copy Nature.

Of course we cannot supply enough ant eggs to feed a brooder of chicks, nor could we find grubs and worms enough, we must supply it artificially, and we must use our own brains to supply it. We can always fall back upon the Poultry Supply House for the dried blood, beef scraps, animal meal or the new granulated milk, or we can give them cooked or raw meat and eggs, best of all milk to drink.

Nature never gives cooked food or mashes and anyone who has tried Nature's plan of a variety of grains, such as we find in chicks feeds, with milk to drink and lots and lots of crisp green food, will never return to mashes and will be one of the "lucky" people who aways succeed.

Another thing Nature supplies in the spring time is pure water, the brooks and streams are full, there are raindrops and dewdrops on leaves and grass. How often I have seen the partridges and pheasants sipping from those diamond drops. How different to the stale, warm, dirty water of many a brooder, where the owner attributes the diarrhoea and death rate to a chill or over heating on his usual "bad luck."

We cannot have running water in our brooders, but we can supply clean water two, three, or half a dozen times a day. Water is cheap, try keeping the water supply clean, and cool and frequently changed. I assure you it will greatly diminish the mortality.

Another thing Nature supplies and that is fresh air. The smell in some of the brooders and even in the brooder houses is enough to cause mortality, without the poor food and dirty water. The wonder is to me that any chickens live in some brooders.

Open up the brooders, air them, sun the hovers every sunny day and keep them as clean as the ground in the wild woods, and if ever you are in doubt "Interrogate Nature."

A bob-tailed pullet on a rickety hen-roost is a sure indication that there is no money in poultry.

EDITOR'S QUESTION BOX.

Worms. (F. C. F., Tropico). Will you suggest the cause and cure of worms in my White Rock hens? Several have them and one died from their effect.

I feed them Coulson's egg food and bran in the morning and rolled barley and whole wheat at night. Plenty of good water, clean coops and grounds, green food and no crowding, some lice but no mites.

I have found worms as large as darning needles in some of their droppings, these soon die and dry up on exposure to air. They are white and pointed at both ends. I bought the hens of a prominent dealer and fancier in Los Angeles who makes a specialty of the breed.

Any suggestions that you may make will be appreciated.—New Subscriber.

Answer. The cause: The hens are picking up and eating the worms or worm eggs from the droppings of other fowls or each other. I lost a large number of young chicks from some of the neighbor's pigeons which would trespass into my yards. I saw the worms in the droppings. Pigeons are great disease carriers, bringing in roup, canker, chicken-pox, mites, lice, worms, etc.

Cure: There are several different cures but the one I found most effective with mature hens is let them fast for from twelve to twenty-four hours then give each a teaspoonful of turpentine in a teaspoonful of castor oil. Put half a teaspoonful of turpentine in a quart of water and give them no other water for a week. This will always kill the worms that you describe. Meanwhile spade over your yards, being careful to turn under the top of the soil and plant a crop of barley or wheat on it.

I sprayed my brooder corrals with the kerosene emulsion then sprinkled them over with air-slaked lime, dug that in and then raked in a crop of barley, and within a week I stopped the mischief.

With little chicks thirty drops of turpentine in a pint of drinking water for a week will cure them. Adult fowls require a stronger dose.

For tape worm, let the hen fast twenty-four hours, then give her ten drops of tincture of male fern in a little water and follow with a dose of castor oil.

* * *

Water-glass. (S. R., Anaheim). Please tell me what proportion of water to use for keeping eggs.

Answer: One part of silicate of soda to ten parts of water that has been boiled.

CARE OF DUCKLINGS.

The incubating of ducks' eggs is not different from hatching of hens' eggs, but the care of young ducks is radically different in many respects from that required for chicks. Unlike chicks, the ducklings must be removed from the incubator very soon after the hatch is complete and the young ones dried off. The heat of the brooder after the ducks are in should be little less than that of the nursery in the incubator from which they are taken. This rules from 95 to 100 degrees, and should be continued for twenty-four hours, during which the ducks should be kept under cover most of the time.

The first feed should be given when they have been in the brooder a few hours and nothing is better than stale bread moistened with skim milk, in which is sprinkled a little coarse sand or fine grit. It should be fed on shallow tin plates which are easily cleaned and frequently scalded. After the first day food should be offered four or five times a day and any not eaten promptly removed . If a sufficient quantity is available the bread and milk diet should be continued for two or three days, when wheat bran and cornmeal in the proportion of two part bran to one of meal may be added, gradually increasing the quantity from one-third at beginning to three-quarters at the end of the week. A proportion of one-quarter bread may be continued with advantage, and the sand or grit should be 5 per cent. of the whole from this period on. Powdered charcoal sufficient to make it pretty black may be sprinkled in the food once each day, and granulated charcoal and grit need to be within reach of the young ducks constantly.

Water with the chill taken off should be within reach. Ducks must have water even though they spend their spare time in distributing the contents of their drink dish over the surface of the pen, creating a disturbance decidedly detrimental to their well being. To avoid this it is sometimes advisable to remove the water after after each meal, a fresh supply being provided for the next.

If the beginning of th second week finds the ducklings strong and full of life it augurs well for a fast and steady growth to killing time and maturity. The rotation and manner of feeding may remain unchanged, but the youngsters must have more exercise, part of which should be in the open air and on grass when convenient.

Green food should be provided from this time forward. If early in the season, chopped cabbage or mangel wurzels may be fed separately, or steamed cut clover from which the strong stems have been removed may be fed in the mash, making 20 per cent. of the whole. But when green grass or clover can be obtained it is much to be preferred and should be gathered, cut fine and fed in the morning while the dew is on.

Animal food is needed after the first week. Beef scraps are most in favor for this purpose on account of its availibility and keeping qualities. It should be sifted for the young ducks until they are three weeks old and may be increased in quantity from 5 per cent. of the mash during the second week to 10 or 12 per cent. at the end of three weeks.

This ration will give good results until it is time to fatten the birds for market.—Reliable Poultry Journal.

$1500
For the above sum, Captain Mitchell of Santa Barbara will sell his poultry business and good will. The outfit consists of 1000 Standard Bred S. C. White Leghorn laying hens and pullets and their fixtures, i. e., Brooders, houses. Posts, 6 foot "Union Lock" Fence Wire, Etc., Etc.
Sales of eggs for hatching average 14,000 per year at $70 per 1000, and the net income per annum for the last four years has been from $1000 to $1500. For further particulars apply to

CHOOSING THE HEAD OF THE FLOCK.

While it may seem to be a little early to discuss the bird that is to head the flock during another season, the farmer poultryman must rely on his eggs for breeding purposes from the birds who produce the market eggs and whether the male is kept with the hens during hot weather or not (it is better not) he should be selected early so that he may be trained in the way he should go. Here are a few of the faults which should be sought for in selecting a male for the pen for breeding stock. Discard a male with a pale face and comb or if he shows any weakness of legs or is run down. He should be proud and steady, he should be broad of back and there should be no nostril discharges. If a bird is selected with these points in view, not all the good or the bad points by any means, but most of the essential ones, the eggs will be strong and healthy. Once a good male is secured he must be well fed whether by himself or running with the hens, and care must be taken, in the latter case, to see that he has enough even it is necessary to take him away by himself, for feeding when running with the hens. Old breeders say that the male is one-half the value of the pen and this being the case he requires the best of attention.

USES OF CHICKEN FEATHERS.

One turkey supplies more different grades of feathers than a season's receipt of turkeys show different grades of turkeys, and although 5 cents a pound covers the range of difference in value of the toughest old tom turkeys and the plumpest young hen, the feathers sell at 5 cents a pound for the body feathers up to 40 cents a pounds for the fine tail feathers, says the Indianapolis News.

Local poultry men sort out six to eight grades of turkey feathers and the buyers make even more assortments, the feathers being used for as many different purposes. The small body feathers, which are used for pillows and feather beds, are worth about 5 cents a pound for common mixed. White feathers are worth more according to grade, bringing generally about three times the price paid for mixed feathers.

The fine tail feathers used for dusters are kept separate and sell for about 40 cents a pound and the "skirt" feathers are worth nearly as much. The wing and "point" feathers are also carefully saved and sold to manufacturers of featherbone and other substitutes for whalebone, and the larger ones find their way to milliners, after being made over, cleaned and dyed. Some of the small feathers are made up into artificial bird breasts and tails that adorn countless bonnets. They may cause the bonnet owners a twinge of conscience for wearing such a beautiful bird, when, in reality, they are wearing a bunch of cleverly arranged chicken or turkey feathers.

Duck feathers are worth about 35 cents a pound and goose feathers range from 60 cents a pound for white to 50 cents for mixed. Dealers say the principal reason that goose and duck feathers are worth more than the finest turkey and chicken feathers is that aside from being fluffier, there is an absence of odor to them that cannot be overcome entirely in chicken and turkey feathers. The reason that white chciken and turkev feathers are worth more than mixed, however, is that they are available for mixing with the better grades for pillows.

Most of the chicken feathers go in the 5 to 10 cents a pound class, to be used for cheap feather beds and pillows, the white feather being saved separate and bringing a good premium over the mixed grades. Fine tail and wing feathers are saved separate, selling as high as 40 cents.

Feathers shipped from this market are packed in bales of 200 pounds or in six-foot sacks. The tail and wing feathers are usually packed in boxes and sometimes tied in neat bundles.

Five chickens will give a pound of feathers, and with Indianapolis firms killing 2000 to 3000 chickens a day for home consumption and shipment, this market has nearly two tons of feathers a week to sell. A week's output can be packed in twenty bales, 4 by 5 by 3 feet each, but if the feathers were loose they would fill a house.

A single carload of feathers shipped to Cincinnati contained about six tons. They cost the shipper more than $1600 Cincinnati and Chicago are good buyers of all grades of feathers, most of the local shipments going to those cities.

WHAT A HEN DID.

Buying a hen for 50 cents, setting her on 13 eggs and getting 11 healthy chicks, and she commencing to lay long before weaning her babies, and shelling out four dozen eggs before the end of the summer. That's going some for a "measly" hen, isn't it? There are thousands of others just like her and, yet, there are many persons who say there is no profit in poultry. Let's take another look at the afore-mentioned hen. Her first cost is 50 cents. We'll say her feed cost $1 for a full year. Total, $1.50. Now, we'll allow $1.50 for the setting of eggs. The total is now $3. Eleven chicks hatched and eight of them raised to maturity when they are worth at least $1 each or a total of $8. The four dozen eggs are valued at 80 cents or $1. The hen has returned $9 for that $3, and she has several months still to her credit before the end of the year in which to make the egg basket a little fuller.

KILLED BY THE FUMES.

You must kill the lice on the fowls some way. If you don't care to handle them singly, use our liquid

PRUSSIAN LICE KILLER.

Simply paint the roosts and drop boards with it. The fumes arise and kill the lice on fowl and pen. It catches them all to the last mite, and it takes the nit as soon as it comes to life. The fumes do the work. It is the perfect, easy method of protection and cure. But if you like the powder treatment better, don't forget the old reliable **Prussian Lice Powder.**

Enclosed please find 40 cents for another can of lice powder. We were well pleased with the first can, but we need and must have more.—H. F. Lake, Yankton, S. D.

Prices: Lice Killer, 50c and $1.00; 5 gallon can, $4.00. Lice Powder, 25c; by mail 40c. Remember also our famous **Prussian Poultry Food.** Get either of these from your dealer. If you don't find them write us at once. We will supply you and send you also our 68-page book.

Prussian Remedy Co., St. Paul, Minn. Special Agents: Chas. H. Lilly Co., Seattle, Portland, San Francisco; Chas. Winsel, Los Angsles; J. S. Pollock, Pittsburg; Eltmiller Bros., Baltimore; Vaughan Seed Store, Chicago; J. W. Wilder & Co, Cincinnati, Ohio.

Poultry and Eggs Wanted

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

SIX MONTHS TRIAL

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX NONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our ON TIME PLAN, and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—it will be mailed to you free.

THE DRAFT OF PLOWS.

The following question was sent to the Country Gentleman: "What is the approximate pull in pounds required to move an ordinary plow 2½ miles per hour when turning a furrow 14 inches wide by 7 deep in clay gravel sod, on level ground with the ordinary amount of stone? How much would the resistance be increased on a 30 per cent grade?"

It was answered thus fully by Prof. F. H. King.

"There are so many factors which influence the draft of a plow that only a general answer can be given. The draft of a sod plow depends on the character of the sod, the shape of the plow, and the moisture conditions of the soil at the time it is plowed, as well as on the character of the soil and the dimensions of the furrow. In the following table there are given the average draft of plows for soil in good moisture condition, of the medium clay type, in the condition of stubble, for different dimensions of furrows, and with the medium stubble shape of mold-board. This table has been constructed from a careful consideration of all available draft trials of plows made in England and in this country, and is intended to represent the fact for the best present-day plows when well handled in soil in good stubble condition:

Width, inches.	Depth of furrow—inches.								
	4	5	6	7	8	9	10	11	12
9.....	176	205	233	261	289	317	345	374	402
10.....	203	235	266	296	329	360	392	423	454
11.....	230	265	299	332	369	403	438	473	507
12.....	257	295	332	367	408	446	484	522	560
13.....	283	325	366	402	448	489	530	571	613
14.....	310	355	399	438	488	532	577	621	665
15.....	337	385	432	473	527	575	623	670	718
16.....	364	415	465	509	567	618	669	720	771
17.....	391	445	499	544	607	661	715	769	823
18.....	417	475	532	579	647	704	761	819	876

In this table the figures represent the total draft in pounds which a team would have to exert steadily when drawing the plow forward through the soil; thus a 14-inch plow cutting a furrow 14 inches wide and 7 inches deep will require an average pull of 438 pounds, and this pull, when the team is walking at the moderate rate of 2½ miles per hour, represents 2.92 horsepower. In the next table there are given the number of the horsepower required to cut each size of furrow (width being given in inches in first column) when the total draft is that given in the last table and when the plow is drawn forward at the rate of 2½ miles per hour:

	Depth of furrow inches.								
	4	5	6	7	8	9	10	11	12
9	1.18	1.36	1.55	1.74	1.93	2.12	2.30	2.49	2.68
10	1.35	1.56	1.78	1.96	2.19	2.40	2.61	2.82	3.03
11	1.53	1.76	1.99	2.21	2.46	2.69	2.92	3.15	3.38
12	1.71	1.96	2.22	2.45	2.72	2.97	3.23	3.48	3.73
13	1.89	2.17	2.44	2.68	2.99	3.26	3.53	3.81	4.08
14	2.07	2.36	2.66	2.92	3.25	3.55	3.84	4.14	4.43
15	2.25	2.56	2.88	3.15	3.52	3.83	4.15	4.47	4.79
16	2.42	2.76	3.10	3.39	3.78	4.12	4.46	4.80	5.14
17	2.60	2.96	3.33	3.63	4.04	4.41	4.77	5.13	5.49
18	2.78	3.16	3.55	3.86	4.31	4.69	5.08	5.46	5.84

It may appear strange that it requires less than 500 pounds steady pull to cut a 14 by 7-inch furrow and that this work represents the work of nearly three horsepower. The matter will be made more evident when it is understood that it requires but about 150 pounds to pull a ton on an ordinary level road when on the wagon. The 438 pounds of pull will draw two tons on a wagon weighing 1800 pounds over an ordinary level earth road.

There is a very appreciably heavier draft on sod ground over that on stubble ground in the same condition of moisture. On a clover sod of the second year in a good condition of moisture and with the prairie-breaking type of plow, the draft of a 14 by 7 inch furrow was 440 pounds, without the coulter. On the same sod a little later, when the soil had become too dry, the draft was 1058 pounds. Using the stubble plow side by side with the breaking-plow when the soil was in good moisture, the draft for the same furrow was 527 pounds, instead of 440. Here is seen the influence of the shape of the plow on the draft.

In regard to plowing up a 30 per cent grade, the grade itself in no way affects the draft of the plow, but the increase of work results from the team having to lift itself and the plow, together with the plowman, if a riding plow is used, at the rate of 30 feet in every 100 feet. So steep a grade as this does not occur in fields plowed with teams. On such grades as this, the team would be required to lift 30 per cent of their weght to simply move themselves up the hill. Up a hill rising 10 feet in 100, the team, in addition to drawing the plow, would have to exert a force equal to one-tenth of the dead weight of the team, plow and plowman, if a sulky plow. Suppose the sulky plow to weigh 475 pounds, the man 150 pounds, the three horses 3600 pounds, or a total weight of 4225 pounds. Ten per cent of this weight becomes added work for the team when plowing up a 10 per cent grade, so that in plowing a 14 by 7-inch furrow up such a grade the labor for the team becomes what is equivalent to a draft of 860.5 pounds. In other words, to plow up such a grade, with the conditions named, nearly doubles the amount of work required of the team.

VALUE OF GRAPE JUICE.

The effects of unfermented grape juice on the human system have been studied for a number of years, especially at the so called grape cures so long in vogue in Europe. A smaller number of investigations have been made in laboratories.

It is quite generally claimed that using a reasonably large amount of unfermented grape juice with an otherwise suitable mixed diet is beneficial and that digestion is improved, intestinal fermentation diminished, and that gains in body weight result. It should not be forgotten that the abundant diet and hygienic methods of living at grape cure play an important part, but even taking all this into account it seems fair to conclude that some of the good results can be directly attributed to the unfermented grape juice.

Grape juice contains the same kinds of nutrients as other foods. The percentage of water is high, and thus it resembles liquid foods more closely than solid foods. It is somtimes compared with milk, the most common liquid food. It contains less water than milk, more carbohyrates, and less protein, fat, and ash. Carbohydrates, largely present in the form of sugar, are the principal nutritive ingredients. It is evident, therefore, that grape juice is essentially an energy yielding food, and may help the body to become fatter, though it cannot materially assist in building nitrogenous tissue. Sugars in moderate amounts are wholesome foods, and grape juice offers such material in a reasonable dilute as well as palatable form. Undoubtedly the agreeable flavor increases the appetite, a by no means unimportant consideration.

Geese are profitable to raise where one has pasture to turn them out on. They will require almost no grain food and are nearly clear profit when marketed at Thanksgiving or Christmas time.

WHY WE DO NOT CAN FRUIT RAW.

Many a housewife has never asked herself the question: "Why do I cook fruit, vegetables, etc., before canning them? Why not can them raw?" It is not because they are improved by the cooking in either taste or appearance. The women would much rather have whole, fresh peaches, pears, cherries, etc., just as they come from the trees than to have them cooked and preserved. Why then do we cook fruit before canning? Not surely on account of taste and looks, for we would much rather have them fresh if we could.

We cook fruit not for the sake of cooking, but to kill the tiny microscopic organisms with which all fruit and vegetables are covered, and which, if alive, develop and increase in numbers and attack the fruit, causing it to spoil.

There are some substances which resist the attacks of germs. Fermentation germs do not like thick sugary syrup. That is the reason jelly keeps fairly well without air-tight covering. Fermentation germs do not like alcohol. Fruit would keep forever in alcohol, but there are sanitary, economic and moral reasons why we do not preserve fruit in alcohol.

To insure absolute success in canning, there are two things to watch; cook the fruit, etc., long enough to be sure all germs are killed, and then put the food up in a can that is absolutely air tight so that no germs can make their way in after the jar is on the shelf. A fruit jar must be first, last and all the time air tight. There is danger in a porous rubber ring or a top that does not fit to the ten-thousandth part of an inch. The little germs which cause fermentation and decay in food stuffs are so tiny that they could march one thousand abreast through the eye of a cambric needle. It means something to say a fruit jar must be air tight.

Some housewives rather ruffle up at the suggestion that the air in their kitchens contains a germ of any kind. You may think the air in a room is pure as crystal, but let a sum beam fall aslant the floor and you will see that the air contains millions and millions of tiny dust particles. Still smaller than dust particles are the mischevious organisms which cause fermentation. They are here, there and everywhere in every kitchen, no matter how clean.

So remember, successful canning means to kill all the germs by thorough cooking before the fruit or vegetables are placed in the jar and then to use a can that is absolutely air tight; air tight not for a day or a week but for months and years.

The Economy Jar, which has been in use throughout Europe, Australia and the Sandwich Islands for some time, has been introduced into this country and fills the above requirements for a sanitary and absolutely sure-sealing, air-tight jar.

Queries and Replies

UNSIGNED QUERY.

"Regular Reader" is reminded that anonymous communications go into the Cultivator's waste basket.

CUCUMBER SOIL.

Editor Cultivator:—Will you please inform me how to make good potting soil for cucumber. I have read "Early Cucumbers" in last week's number with much interest.—R. J., Fullerton.

A loose, friable, well enriched loam is all that is needed. Don't be afraid of too much well rotted stable manure, they are gross feeders.

PROBABLY CYPERUS.

Editor Cultivator:—I inclose a sample of grass growing in my orchard. Some say it is nut grass and some say Florida onion. I would like to know if there is any way of killing it out. Please answer through Cultivator as soon as possible.—J. G. S., Arlington.

Your plant is neither nut grass or Florida onion and is too immature to determine with certainty. If you will send us a plant with flowers we will tell you what it is. The young plant sent looks like cyperus or "umbrella grass." There is no way to get rid of it except intensive cultivation. Cyperus seeds always float down the water ditches.

BOTTLE TREE SEED.

Editor Cultivator:—Could you give me any information about the ornamental tree called Diversifolia; as to where I could obtain the seed, as I would like to put out a good many of them. When is the right time to plant the seed, etc.—C. R. Gregg, Downey.

Will some of our readers inform Mr. Gregg in case they have seed of this tree (Sterculia diversifolia, the Bottle Tree). Sow in August or September or very early spring.

IMPROVED SILK REEL.

Many readers have written to ask about the new patent silk reel about which we published a statement some weeks ago. The patent for this invention has not yet been forwarded from Washington, but as soon as it arrives we hope to tell our readers more about it.

MELON APHIS.

Editor Cultivator:—Please give me the best remedy for aphis on watermelon vines.—W. F. S., Tropico.

When Prof. W. F. Clarke of the University was in the South he told the melon growers of Burbank that the most effective treatment was by carbon bisulphide, using a minature tent over each hill. Take two wooden hoops, cut one in two equal parts and arch them over the whole one, crossing them at right angles to make a frame work for a half circle tent. Cover this with glazed paper or some substance that will retain the fumes. Gather up each vine so it will be covered by the "tent," place a small saucer on top of vine and into this pour a small quantity of the bi-sulphide, quickly cover with tent, scrape loose earth around bottom to keep in the gas and proceed down the row. Prof. Clarke states that about forty of these are used by some growers. There seems to be no other practical and effective method of dealing with melon aphis.

The way to prevent robbing is to prevent it—guard yourself against it. Always retail your honey direct to consumer when you can.

SAN FRANCISCO, THE DAUNTLESS.

San Francisco is now in course of reconstruction; the debris is rapidly being removed and the hum of industry has supplanted the roar of the flames. The abiding results of the fire will be wider streets more imposing edifices, larger parks, and a complete fire-fighting system which will utilize the waters of the ocean. The real estate market weathered the storm and shows great activity.

San Francisco is the city of opportunity. The vast fertile country back of it promises the yield of an exceptionally good year's crop. The chance for business investment is magnificent; Eastern and local money will be poured in freely while the rebuilding progresses. The history of all such events as that which has just transpired proves that the ultimate result is a general improvement in conditions and a vast increase in community wealth!

* * *

The following letter has been addressed to canners, orchardists and others throughout California. It is expected that many people will find employment in this way. All those who can give employment of this character should send in their requests to M. V. Stafford, State Labor Commission.

"There are at present a large number of persons in San Francisco and vicinity who would undoubtedly be glad to secure employment in the interior and be of value in handling the crop during the coming season. In order that these may be properly directed it is suggested that you fill out the enclosed form promptly and mail to W. V. Stafford, State Labor Commissioner, Herman and Fillmore sts., San Francisco, who will then advise you as to the filling of your requirements and attend to other details in connection with the plan."

NEW RULE ON DESERT LAND.

Absolute ownership of all water rights is required before desert land entries can be proven up, according to a rule promulgated by the general land office, which has resulted in the rejection of numerous final proofs.

The claimant must be absolute owner of the water stock appurtenant to the land. Five thousand dollars of stock hypothecated for $500 is an insufficient showing of reclamation.

Another drastic rule relative to desert land entries is that only the first plowing and breaking of the land is credited as the work of reclamation. Subsequent cultivation and crop raising is held as a mere investment. These two rules indicate a policy of the general land office adverse to any effort to use the desert land act for speculative purposes.

TO THE LIVING FLAG.

Canst be that thou insensate art,
Oh, flag, so loved and cherished
That armies countless thousands strong
Have fought for thee and perished?
That armies countless thousands strong,
At thy dumb call elated,
Would spring to arms again for thee,
Though knowing death awaited?

Nay, quivers life through every fold,
Each wave and undulation
That measures with its rise and fall
The heart throbs of a nation.
Aye, in thy folds, a century old,
A century's life is surging,
And over all waves a clarion call
To blood that needs no urging.

Life thrills thy red, in courage bred;
The purity of thy whiteness;
Thy field of blue, in truths own hue,
Thy stars of dazzling brightness.
And courage, truth and purity,
Thus in thy colors blended,
Have fired the hearts and nerved the arms
Which have thy cause defended.

So children of the men of old
Who first unfurled to glory
The beauty of thy stars and stripes,
Now famed in song and story,—
To save the flag their blood baptized
When we were born a nation,
We pledge the lifeblood of our sons
In solemn consecration.

—Hattie Harl.

EDITING AN AGRICULTURAL PAPER.

The sensation of being at work once again was luxurious, and I wrought all the week with unflagging pleasure. We went to press, and I waited a day with some solicitude to see whether my effort was going to attract any notice. As I left the office. toward sundown, a group of men and boys at the foot of the stairs dispersed with one impulse, and gave me passage-way, and I heard one or two of them say, "That's him!" I was naturally pleased by this incident. The next morning I found a similar group at the foot of the stairs, and scattering couples and individuals standing here and there in the street, and over the way, watching me with interest. The group separated and fell back as I approached, and I heard a man say, "Look at his eye!" I pretended not to observe the notice I was attracting, but secretly I was pleased with it, and was purposing to write an account of it to my aunt. I went up the short flight of stairs, and heard cheery voices and a ringing laugh as I drew near the door, which I opened, and caught a glimpse of two young, rural-looking men, whose faces blanched and lengthened when they saw me, and then they both plunged through the window, with a great crash. I was surprised.

In about half an hour an old gentleman with a flowing beard and a fine but rather austere face, entered, and sat down at my invitation. He seemed to have something on his mind. He took off his hat and set it on the floor, and got out a red silk handkerchief and a copy of our paper. He put the paper on his lap, and, while he polished his spectacles with his handkerchief, he said: "Are you the new editor?" I said I was. "Have you ever edited an agricultural paper before?" "No," I said: "this is my first attempt." Then this old person got up and tore his paper all into small shreds and stamped on them and broke several things with his cane and said I did not know as much as a cow; and then he went out and banged the door after him, and, in short, acted in such a way tnat I fancied he was displeased about something. But, not knowing what the trouble was, I could not be any help to him.

But these thoughts were quickly banished, when the regular editor walked in! [I thought to myself, now if you had gone to Egypt, as I recommended you to, I might have had a chance to get my hand in; but you wouldn't do it, and here you are. I sort of expected you.] The editor was looking sad and perplexed and dejected. He surveyed the wreck which that old rioter and these two young farmers had made, and then said: "This is a sad business—a very sad business. There is the mucilage bottle broken, and six panes of glass, But that is not the worst. The reputation of the paper is injured, and permanently, I fear. True, there never was such a call for the paper before, and it never sold such a large edition or soared to such celebrity; but does one want to be famous for lunacy, and prosper upon the infirmities of his mind? My friend, as I am an honest man, the street out here is full of people, and others are roosting on the fences, waiting to get a glimpse of you, because they think you are crazy. And well they might, after reading your editorials. They are a disgrace to journalism. Why, what put it into your head that you could edit a paper of this nature? You do not seem to know the first rudiments of agriculture. You speak of a furrow and a harrow being the same thing; you talk of the moulting season for cows; and you recommend the domestication of the pole-cat on account of its playfulness and its excellence as a ratter. Your remarks that clams will lie quiet if music be played to them was superfluous—entirely superfluous. Nothing disturbs clams. Clams always lie quiet. Clams care nothing whatever about music. Ah! heavens and earth, friend, if you had made the aquiring of ignorance the study of your life you could not have graduated with higher honors than you could today. I never saw anythink like it. Your observation that the horse-chestnut, as an article of commerce, is steadily gaining in favor is simply calculated to destroy this journal. I want you to throw up your situation and go. I want no more holiday—I could not enjoy it if I had it. Certainly not with you in my chair. It makes me lose all patience every time I think of your discussing oyster-beds under the head of 'Landscape Gardening.' I want you to go. Nothing on earth could persuade me to take another holiday. Oh! why didn't you tell me that you didn't know anything about agriculture?"

"Tell me, you cornstalk, you cabbage, you son of a cauliflower! It's the first time I ever heard such an unfelling remark. I tell you I have been in the editorial business going on fourteen years, and it is the first time I ever heard of a man's having to know anything in order to edit a newspaper. You turnip! I take my leave, sir! Since I have been treated as you have treated me, I am perfectly willing to go. But I have done my duty. I have fulfilled my contract, as far as I was permitted to do it. I said I could make your paper of interest to all classes, and I have. I said I

Tools for Business

The best hand tool a farmer can use is a Keen Kutter tool. A Keen Kutter hoe, fork, shovel, or scythe will do more hoeing, pitching, shoveling, or mowing than any other similar tool—because it is better adapted to its work and stands more hard wear. Farmers accomplish more, and make more when they use

KEEN KUTTER TOOLS

Hoes, Forks, Scythes, Shovels, Manure-hooks, Rakes, Grass-shears—all Garden Tools and a complete line of Carpenter Tools—are each of the very highest *quality.*

All working or cutting parts are forged from best crucible steel, and oil tempered to give elasticity and long wear. This careful manufacture makes Keen Kutter tools longlived—they last twice as long as common tools. Each Keen Kutter Tool is finely finished, and properly hung or adjusted for best and easiest work.

Ask your dealer to show you tools bearing the Keen Kutter trade mark. If he does not have them write us.

MANY ROUTES

East and West

SUNSET Via New Orleans and El Paso

OGDEN Vian an FraScisco

SHASTA Via Portland

Pullman Vestibuled Trains Daily. Personally Conducted Tourist Excursions via all routes every day in the week at Reduced Rates. The SOUTHERN PACIFIC gives you choice of many routes from the northern boundary of the United States to the Atlantic Coast, so that you may go one way and return another, with varied scenery and climatic conditions.

Full information at 261 S. Spring St., Los Angeles, or from any agent

SOUTHERN PACIFIC

A Delightful Way to Go East

Is Via The

Scenic Salt Lake Route

Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City. thence over the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's

BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.

SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.

THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.

THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.

DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.

EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.

EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:
May 25, 26 and 27—New Haven, Conn. Rate 92.10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky. Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50. St. Paul and Minneapolis, $70.00. St. Louis, Memphis and New Orleans, $67.50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.

Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returning.

T. C. PECK, A. G. P. A., Los Angeles, Cal.

could run your circulation up to twenty thousand copies, and if I had had two more weeks I'd have done it. And I'd have given you the best class readers that ever an agricultural paper had—not a farmer in it, nor a solitary individual who could tell a water melon from a peach vine to save his life. You are the loser by this rupture, not me, Pie-plant. Adios." I then left.

WOMAN'S RIGHTS.

I picht tent in a small town in Injiany one day last season, & while I was standin at the door takin money, a deppytashen of ladies came up and sed they was members of the Bunkumvil Female Refórmin & Wimmin's Rite's Associashun, and they axed me if they could go in without payin. "Not exactly," sez I, "but you can pay without goin in." "Do you know who we air?" said one of the wimmin—a tall and feroshus lookin critter,—'do you know who we air, Sir?" "My impreshun is, " sed I, "from a kersory view, that you are shemales. "We are, Sur," said the feroshus woman—" we belong to a society whitch beleeves wimmin has rights—whitch beleeves in razin her to her proper speer—whitch beleeves she is endowed with as much intelleck as man is—which beleeves she is trampled on and aboosed—& who will resist hence4th & forever the incroachments of proud and domineering men."

During her discourse, the excentric female had grabbed me by the coat kollor & was swinging her umbrella wildly over my head. "I hope, marm," sez I, starting back, " that your intentions is honorable. I'm a lone man here in a strange place. Besides, I've a wife to hum." "Yes," cried the female, "& she's a slave! Doth she ever dream of freedom—doth she never think of throwin off the yoke of tyranny, & thinkin and votin for herself? Doth she never think of these here things?" "Not bein a natral born fool," sed I by this time a little railed, "I can safely say that she dothun't." "Oh, whot—whot!" screamed the female, swingin' her umbrella in the air. "Oh, what is the price that woman pays for her experience!" "I don't know," sez I, "the price to my show is 15 cents pur individool." "& can't our society go in free?" asked the female. "Not if I know it," sez I. 'Crooil man!" she cried, & burst into teers. 'Won't you let my darter in?" sed anuther of the excentrick wimin, takin me afeckshunately by the hand. 'Oh, please let my darter in, shee's a sweet gushin child of nature." "Let her gush,'" roared I, mad as I cood stick at their tarnal nonsense: "let her gush." Whereupon they all sprung back with the simultaneous observashun that I was a Beest. "My female friends," said I, "be4 you leeve, I've a few remarks to remark: wa them well. The female woman is one of the greatest institooshuns of which this land can boast. Its onpossible to get along without her. Had there been no female wimin in the world I should scarcely be here with my unparaleled show on this very occashun. She is good in sickness—good in wellness—good at all time. Oh, woman, woman!" I cried, my feelins worked up to a hippoltick pitch, "You air a angle when you behave yourself, but when you desert your firesides, &, with heds full of wimin's rites noshun's go round lke roarin lyons, seeking whom you may devour somebody—in short, when you undertake to play man, you play the devil and air an emfatic noosance. My female friends," I continnered, as they were indignantly departin, "wa well what A. Ward has sed!"—Artemus Ward.

A SOLID PLATFORM.

The Woman's Suffrage Association of Santa Clara county have adopted the following platform:

1. We believe child labor to be not only barbarous cruelty, but the criminal destruction of future helpful citizenship.

2. We believe in compulsory universal education.

3. We believe in the enactment and enforcement of such national pure food legislation as shall protect the people from adulterated and misbranded foods.

4. We believe domestic science should be taught in our public schools.

5. We believe sanitary regulations should be enforced everywhere.

7. We believe the newspapers to be the best medium of education and reform, and we wish to see the press made more reliable and dignified.

8. We believe in public improvements.

9. We believe in equality before the law, and universal suffrage, with an educational clause.

WASH DAY.

Never use any lime or other alkaline powders on your clothes, or you will speedily find hundreds of small holes appearing in them, where the caustic chemicals have eaten the fabric.

The various so called naptha soaps on the market are excellent for cleansing the clothes without much rubbing, according as the soaps are honestly made by reputable manufacturers. Get a good naptha soap, bearing the brand of a standard maker. Follow strictly the directions about using only cold or lukewarm water for the soaking and washing. For the thorough after rinsing the water may be as hot as one wishes. Directions on the wrapper of the soaps say to soak the clothes half an hour, but they may remain in the water all night without any harm, and it is usually more convenient to put them to soak the evening before wash day. If the soap is what it purports to be the clothes will need comparatively little rubbing, and the whitest of them will need no boiling.

A remarkable purifying agent is kerosene, in the family wash as elsewhere. When you use kerosene to make the washing easy you boil the clothes, following these directions: Fill your wash boiler nearly full of cold water and put it over the fire. Shave down a cake of soap or less, according to the size of the boiler. If the boiler holds ten gallons of water, use a pound cake of soap. If it holds six gallons, shave into bits three-fifths of the soap cake. You can judge by your eye how much to use. Stir the soap shavings into the water and let it come to the boil.

Do not use the naptha soaps for this purpose, but just common soap. When the water boils put into it a tablespoonful of kerosene if your wash boiler holds ten gallons; if six galons, not quite three-quarters of a tablespoonful. More will be a waste and possibly may leave an odor upon the clothes. You will see the drops of oil upon the water. Stir them into it. Let the oil and soap water become thoroughly mixed, then clap in your clothes, the whitest and cleanest first. They need no previous soaking or preparation. Let the first lot boil briskly for from twenty minutes to half an hour, then take them out and put the second batch into the same water and boil it accordingly. The more stained and soiled the garments are the longer they will need to boil.

Sometimes there is a third boiling. In that case it is well to add more water, soap shavings and kerosene. While the second batch is boiling you may be rinsing the first lot. It is of the utmost importance that garments thus chemically cleansed with kerosene be thoroughly rinsed. They need usually three rinse waters to mechanically dislodge any dirt particles. The first rinsing may be done with the washboard, rubbing lightly. By this use of kerosene the weekly wash can be put out in half the time and with half the weariness of the old way. The clothes will be dazzling white. Soiled colored garments may be boiled in the mixture after the white clothes have been taken out and will be the cleaner for it.

When you see alleged white garments that are of a dull gray color, like the sheets of a London lodging house bed, you may know that, however well they have been washed, the laundress did not half rinse them. The average laundress is a grievous sinner in this respect. Often the clothes she puts through her hands smell of soap even after they have been dried and ironed. Abundance of rinse water must be used. There must be two rinsings if clothes are to look as they should. Many laundresses use far too much bluing in their rinse water also.

Of course every even halfway well regulated family now has its clothes wringer, which saves knuckles and finger joints and the laundress' strength as well as the garments themselves. Where possible there should be separate from the kitchen a laundry with its own stove, wash bench and ironing table. There ought to be a small ironing board as well as the large skirt board. Men folk must see that there are plenty of good strong clothes poles and clothesline posts.

LETITIA WARREN.

SCOLDING A QUEEN.

Queen Margherita of Italy was recently called to her private telephone in the Margherita Palace at Rome, says the Petit Parisiens, correspondent. The line was laid specially to enable her to converse with her son, the King of Italy, and she naturally expected to hear his voice.

"When are you going to pay me for the coal?" were the words she heard. Seeing at once that there was some confusion her majesty resolved to continue the joke and asked simply, "What coal are you speaking of?"

"You're pretty cool," was the response. "Why, the coal I sent you six weeks ago and can't get you to pay for." A string of insults followed, and the coal merchant was suddenly cut off by a terrified clerk at the exchange who discovered the mistake he had made.

The queen, says the correspondent, was immensely amused at her scolding, and narrated the story with much relish to her suite.

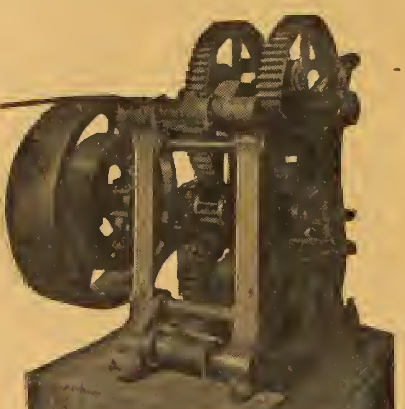
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosph r bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the oest by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

Foreign Lemon Sale.

New York, May 29.—Five thousand boxes of Sicily lemons were sold at auction here today. The market is steady and today's prices were practically unchanged. There will be another sale held Friday when 20,000 boxes will be offered.

NO SUN FLOWER SEED FOR CHICKS.

We raise our sunflowers just as we do corn, planting them with the corn planter on one side of the corn field farthest from the house. Sunflower seeds are not good for young chicks. One year we planted a quarter of an acre near the house. The hens would take their broods there and the chicks would gorge themselves with the fallen seeds. The younger ones could not digest the hulls and so we lost over 50 per cent. We find the chief value of sunflower seeds in giving change of ration and making plumage glossy. We feed sparingly, even to old fowls, but believe them essential to a well-balanced ration for eggs and show birds.—N. E. C.

KEEP THE LARGE FOWLS.

We have kept a large breed for many years and find it profitable to do so as our fences do not have to be made so high and then when company comes or the threshers turn up it does not take half the flock to make a meal and when we go to market they pull down the scales until the dealer looks around to see if we have not put a stone in the crop to make it weigh so heavy, but he finds no stone. Only a few hens, and he makes out a good b[illegible] check.—Ex.

The Macabee gopher trap, safe, simple, sure, is advertised in another column. If not kept on hand by your local hardware store, order by mail. Address the manufacturer at Los Gatos, Cal.

Percy L. Harley, breeder of buff, black, and white Orpingtons, announces a cut of one-half the price on all eggs the balance of the season except best buff. A picture of two of his prize winners appears on another page of this week.

CERTIFICATE OF PARTNERSHIP.

State of California, County of Los Angeles, ss.

We, the undersigned, J. J. Steadman, H. A. Perkins and Frank Honeywell, do hereby certify that we are the persons transacting business in the State of California, at the City of Los Angeles, County of Los Angeles, under the firm name and style of the Cultivator Publishing Company; that the names in full of all the members of such copartnership are J. J. Steadman, H. A. Perkins and Frank Honeywell, and that the places of our respective residences are set opposite our respective names hereto subscribed.

Names.	Residences.
J. J. STEADMAN,	Hollywood, California.
H. A. PERKINS,	South Pasadena, California.
FRANK HONEYWELL,	1702 Hoover street, Los Angeles, California.

State of California, County of Los Angeles, ss:

On this 12th day of May, 1906, before me, H. E. Storrs, a notary public within and for said county and State, residing therein, duly commissioned and sworn, appeared J. J. Steadman and Frank Honeywell, known to me to be the persons described in and whose names are subscribed to the foregoing instrument, and each of them acknowledged to me that he executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal the day and year in this certificate first above written.

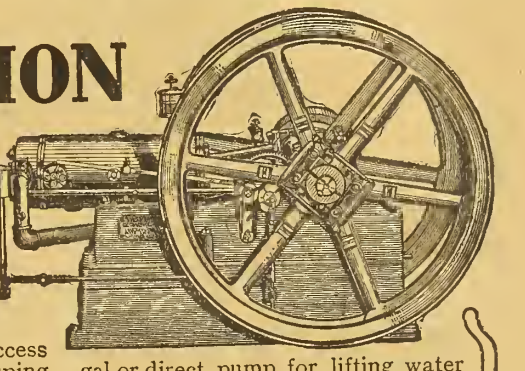
(Seal) H. E. STORRS,
Notary Public in and for said County of Los Angeles, State of California.

State of California, County of Los Angeles, ss:

On this 14th day of May, in the year of our Lord one thousand nine hundred and six, before me, H. E. Storrs, a Notary Public in and for said County of Los Angeles, State of California, residing therein, duly commissioned and sworn, personally appeared H. A. Perkins, known to me to be the person whose name is subscribed to the within and annexed instrument, and acknowledged to me that he executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal in said county, the day and year in this certificate first above written.

(Seal) H. E. STORRS,
Notary Public in and for Los Angeles County, State of California.

FOR IRRIGATION By PUMPING


For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.
The difference between success and failure in an irrigation pumping plant is often a question of fuel.
The I. H. C. engines use gasoline—a cheap and easily transported fuel.
They take the least fuel and convert it into the most power.
They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.
They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.
Anybody can run them without expert knowledge or previous experience.
They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.
They are made in several styles and sizes—
Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.
Vertical—2, 3 & 5 Horse Power.
Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

CALIFORNIA CULTIVATOR

DEVOTED TO
AGRICULTURE
IN ALL ITS BRANCHES

LOS ANGELES JUNE 7, 1906 SAN FRANCISCO

A TYPICAL SHORTHORN OF THE DAIRY STRAIN

PROPERTY OF ROBT. ASHBURNER OF BADEN FARM, SAN MATEO COUNTY, CAL.

There are, in round numbers, seventeen and one-half millions of dairy cows in the United States. In 1850 the average production of milk and butter per cow was only 1,436 lbs. milk and 61 lbs. butter. In the decade from 1850 to 1860, the increase was only 69 lbs. milk and 3 lbs. butter. In the decade from 1890 to 1900 the average production of milk and butter per annum per cow was increased to 3,646 pounds of milk and 155 pounds of butter, a gain of 917 lbs. milk and 40 lbs. butter average per cow.

THE HEN.

The honorable Secretary of Agriculture has finished his count of the eggs laid by the American hen during the past year. The result entitles every rooster to crow just as loud and lustly as he cares to. Like most other families, that of the chicken is one in which the female works and the male boosts. But in this instance the sequel is reversed, and instead of laying low for her mate the hen has laid high! For the honorable Secretary's count came out even 20,000,000,000. Think of it!

Passing over Farmer Wilson's task, which has cooped him up for some time, let us do a little figuring on our own hook. Placed end to end—well, that is a little hackneyed, but it is according to the Hoyle of statistics—these eggs would reach from the earth to the moon and back again; and there would still be enough of them to circle this big egg on which the hens and we live.

A limited train, running fifty miles an hour and making no stops, would have to run one year and one month to take a passenger from the first egg to the last one, and it's ten to one the passenger wouldn't want to get out of the car at the finish—unless the last egg was in cold storage! If the first egg in the line were to burst with enthusiasm—or something more common to eggs—and some one at the last one was possessed of absolutely perfect hearing, and sound could travel that far, it would be thirty hours before the echo of the explosion became audible. And this is straight, even though it is a shell game.

Placed in the balance and not found wanting, the combined weight of this layout would equal three-fourths of the total tonnage of the whole British navy, though, of course, all the eggs would not float. Made into one omlet, the dish on which it was served would have to have a minimum area of at least 9000 square miles, and every human being alive could have one generous helping. Made into eggnog, they would, according to the most reliable authority at hand, set 2.599,999,999 gentlemen hunting keyholes, allowing, of course, for the number who would never get to the place where the keyhole was.

If Adam and the Apple Woman had begun soft-boiling these eggs the very minute after they reached Eden, and had taken them one at a time, the job would still be in its infancy, and would have 140,000 years to run, unless the Egg Boilers' Union stepped in and enforced an eight-hour day, under which circumstances multiply by three.

Valued at 20 cents a dozen, which is probably a fair average the country over, season in and season out, these oblong spheres would about represent the nest-egg of our esteemed fellow-citizen, John D. Rockefeller, or in round figures, $333,333,333.

Truly the American egg is a great institution. The eagle may scream, but the Hen lays it all over him in good form, except when it's bad.—Pa. Farmer.

Old plaster, oyster shells, and clover hay furnish liberally of soluble lime for making egg shells. Cut clover is one of the best foods we have for the layers. Farmers should see that their poultry have lots of it, especially during the winter.

EGGS, 7c DOZEN

What Does It Cost You a Dozen for Your Eggs?

Wouldn't you like to buy a few thousand dozen of nice large fresh laid eggs for 7c a dozen?

And if you learn how to make eggs at a cost of 7c a dozen, it will be equally as good for you, won't it?

You know what the market price is for eggs today, and you know they will be higher after awhile—perhaps 30c, 40c, or even 50c a dozen. Well, if you can get good eggs at a cost of 7c or 8c a dozen, you can see a good chance to make some money this year—can't you?

The Lord helps those who help themselves—therefore, you must act, and do something for yourself when you read this. We'll show you how to make the eggs at a cost of about 7c a dozen, if you want them. How many laying hens have you got? How many eggs do they lay a week? What do you feed them? How much a day does it cost to feed them? Did you ever figure how much a dozen it costs you to produce eggs? Did you know that some feeds costing $40.00 a ton or more, will produce eggs at a less cost per dozen than the other feeds costing $18.00 to $20.00 a ton?

Every poultryman knows about how much a dozen he can sell eggs for, but how many poultrymen figure how much a dozen it costs them to produce these?

When you buy feed, don't figure how many pounds or how many sacks you are going to get for so many dollars, but MAKE MONEY BY USING YOUR BRAINS—BUY THE FEED THAT PRODUCES THE MOST EGGS. The feed that makes the hens lay the most eggs with the smallest number of pounds of feed—figure how much a dozen you can produce eggs for.

INTELLIGENT MEN buy COULSON'S IMPROVED MASH EGG FOOD for their hens—and the other kind of men who haven't any brains, don't know enough to buy it, consequently, they are not making as much money as they might be making. You find them a slave in the world—have been ten or maybe twenty years struggling on and still a poor man. They have nobody but themselves to blame—they know it all; don't want to learn; never will learn—scoff at new ideas—and remain a poor slave.

* * * ** * *

You can produce eggs by feeding COULSON'S IMPROVED MASH EGG FOOD at a cost of 7c or 8c per dozen. For illustration:

Suppose a man has 1000 hens—a 90-pound sack of the IMPROVED MASH EGG FOOD will make the morning meal, as it is not necessary to add anything else to it. A sack of wheat, say 125 pounds, will make the evening meal. The IMPROVED MASH EGG FOOD will cost, say $2.00 and the sack of wheat about $2.00, making the feed for the day cost about $4.00. Now 1000 hens, fed on IMPROVED MASH EGG FOOD, ought to lay at least 600 eggs a day; that would be 50 dozen, so we say the cost would be 8c a dozen; in some cases, where they get 700 eggs per day the cost would only be 7c per dozen.

At the present time, with eggs selling at 17c and 19c per dozen, and as eggs go higher, you can see your profits of so much per dozen, and you can see how much better it is to feed the BEST FEED; therefore it is **FAR CHEAPER** to feed the IMPROVED MASH EGG FOOD to your hens, where it only costs you from 7c to 8c to produce a dozen eggs; whereas it will cost you 10c or 12c per dozen feeding other feeds. This saving of 3c per dozen on the cost to produce eggs inside of a year would mean a whole lot to you.

Eggs at 7c Dozen Earn $12.00 a Day

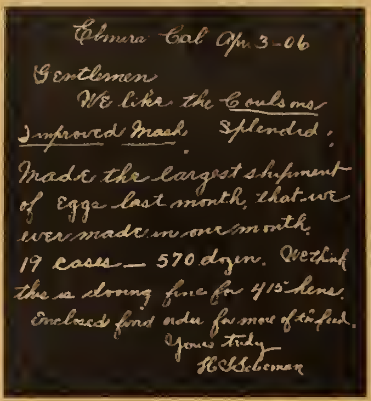
M. Sartori, near Tomales has nearly 2500 laying hens—he feeds them $2.25 worth of COULSON'S MASH EGG FOOD every morning, and about $5.00 worth of wheat in the evening. Total cost of feed, $7.25 per day.

These hens are now laying 105 dozen eggs per day, and sometimes more—by feeding them COULSON'S IMPROVED MASH EGG FOOD once a day, they produce eggs at 7c per dozen.

Mr. Sartori is now getting 19c per dozen, therefore he makes a profit of **OVER $12.00 a day** by feeding COULSON'S MASH EGG FOOD.

4 CENTS A MONTH
to feed a hen Coulson's IMPROVED Mash Egg Food Every Day. Two eggs a month pays for the feed and when you get 18 to 20 eggs a month think of the money the hen earns for you.

Feed $40.10 —— —— Eggs $108.30



Elmira Cal Apr 3-06

Gentlemen

We like the Coulsons Improved Mash Splendid. Made the largest shipment of Eggs last month, that we ever made in one month, 19 cases — 570 dozen. We think this is doing fine for 415 hens. Enclosed find order for more of the feed.

Yours truly

H. L. Scheman

The Farmer's Home Vegetable Garden

By W. R. Beattie, Assistant Horticulturist, Bureau of Plant Industry

Perhaps the most characteristic feature of our American farms is the home vegetable garden. Even where no orchard has been planted, and where the ornamental surroundings of the home have been neglected, a fairly well-kept garden in which are grown a number of the staple kinds of vegetables is generally to be found. In many cases the principal interest in the garden is manifested by the women of the household and much of the necessary care is given by them. A small portion of the garden inclosure is generally devoted to the cultivation of flowers, and a number of medicinal plants are invariably present. Throughout the newer parts of the country one finds that the conditions governing the maintenance and use of the vegetable garden are somewhat different, and, while a number of vegetable crops may be grown somewhere on the farm, there is wanting that distinction so characteristic of the typical New England kitchen garden.

It would be impossible to make an accurate estimate of the value of crops grown in the kitchen gardens of the United States, but from careful observation the statement can safely be made that a well-kept garden will yield a return ten to fifteen times greater than would the same area and location if devoted to general farm crops. A half acre devoted to the various kinds of garden crops will easily supply a family with $100 worth of vegetables during the year, while the average return for farm crops is considerably less than one-tenth of this amount. A bountiful supply of vegetables close at hand where they may be secured at a few moments' notice is of even more importance than the mere money value.

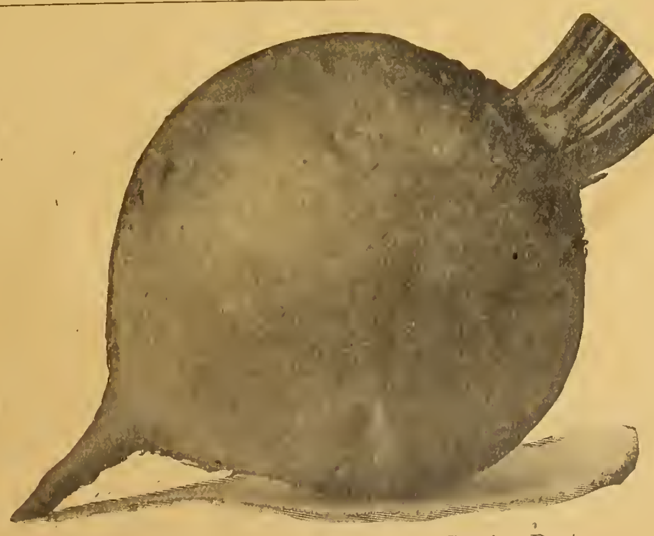
Fresh vegetables from the home garden are not subjected to exposure on the market or in transportation and are not liable to become infected in any way. Many of the products of the garden lose their characteristic flavor when not used within a few hours after gathering. By means of the home garden the production of the vegetable supply for the family is directly under control, and in many cases is the only way whereby clean, fresh produce may be secured. The home vegetable garden is worthy of increased attention, and a greater number and variety of crops should be included in the garden.

Suggestions are herein given as to the location of the garden, the soil and its preparation, fertilizers, seeds, and plants, with brief cultural methods for a number of the more important crops.

* * *

Location—The question of the proximity to the house or other buildings is of great importance when locating the garden. In old homesteads the garden was generally located directly adjacent to the house, requiring but a few steps from the kitchen to reach the extreme parts of the garden. The work of caring for a garden is usually done at spare times, and for this reason alone the location should be near the dwelling. In case the site chosen for the garden should become unsuitable for any cause it is not a difficult matter to change the location. Many persons prefer to plant the garden in a different location every five or six years.

The lay of the land has considerable influence upon the time that the soil can be worked, and a gentle slope toward the south or southeast is most desirable for the production of early crops. It is an advantage to have protection on the north and northwest by either a hill, a group of trees, evergreens, a hedge, buildings, a tight board fence, or a stone wall to break the force of the wind.



Dewing's Improved Blood Red Garden Beet.

Good natural drainage of the garden area is of prime importance. The land should have sufficient fall to drain off surplus water during heavy rains, but the fall should not be so great that the soil will be washed.. The surface of the garden should not contain depressions in which water will accumulate or stand. Waste water from surrounding land should not flow toward the garden, and the fall below should be such that there will be no danger of flood water backing up. The garden should not be located along the banks of a creek or stream that will be liable to overflow during the growing season.

A good fence around the garden plot is almost indispensable, and it should be a safeguard against all farm animals, including poultry, and should be close enough to keep out rabbits. A tight board fence will accomplish this result and also serve as a windbreak.

Plan and Arrangement.—It would be difficult to give a plan or specific arrangement for a garden that would suit all demands, and such a plan must be devised by each individual grower. Suggestive arrangements, however, are here presented, with the idea that they can readily be changed to suit local conditions.

* * *

Kind of Cultivation.—The first consideration in planning the arrangement of a garden is the kind of cultivation that is to be employed. Where the work is to be done mainly by means of horse tools the arrangement should be such as to give the longest possible rows, and straight outlines should be followed. The garden should be free from paths across the rows, and turning spaces should be provided at the ends. For hand cultivation the arrangement can be quite different, as the garden may be laid off in sections, with transverse walks, and the rows can be much closer for most crops. Horse cultivation is recommended whenever possible, as it very materially lessens the labor and cost of caring for the crops.

* * *

Location of Crops.—The second matter for consideration is the location of permanent crops, such as asparagus and rhubarb, and if any of the small fruits, such as raspberries, currants, and gooseberries, are to be planted within the garden inclosure, they should be included with the permanent crops. The area devoted to the hotbed, cold frame, and seed bed should be decided upon, but these may be shifted more or less from year to year or located in some convenient place outside of the garden.

Where there is any great variation in the composition of the soil in different parts of the garden it will be advisable to take this into consideration when arranging for the location of the various crops. If a part of the land is low and moist, such crops as celery, onions, and late cucumbers should be placed there. If part of the soil is high, warm, and dry, that is the proper location for early crops and those that need quick, warm soil.

* * *

Succession of Crops.—In planning the location of the various crops in the garden, due consideration should be given to the matter of succession in order that the land may be occupied at all times. As a rule it would not be best to have a second planting of the same crop follow the first, but some such arrangement as early peas followed by celery, or early cabbage or potatoes followed by late beans or corn, and similar combinations, are most satisfactory. In the south as many as three crops may be grown one after the other on the same land, but at the extreme north, where the season is short, but one crop can be grown, or possibly two by some such combination as early peas followed by turnips.

Where there is considerable choice in the location of the garden plot, it is often possible to select land that will require very little special preparation. On the other hand, it may be necessary to take an undesirable soil and bring it into suitable condition, and it is generally surprising to note the change that can be wrought in a single season.

* * *

Smoothing and Pulverizing.—After plowing, the next important step is to smooth and pulverize the soil. If the soil be well prepared before planting the work of caring for the crops will be very materially lessened. It is not sufficient that the land be smooth and fine on top, but the pulverizing process should extend as deep as the plowing. Some gardeners prefer to thoroughly cut the land with a disk harrow before plowing, so that when it is turned by the plow the bottom soil will be fine and mellow. After the plow the disk or cutting harrow is again brought into play and the pulverizing process completed. If the soil is a trifle too dry and contains lumps, it may be necessary to use some form of roller or cold crusher to bring it down. For smoothing the surface and filling up depressins a float or drag made from planks or scantlings will be found serviceable.

* * *

Fertilizers.—The kind of fertilizer employed has a marked influence upon the character and quality of the vegetables produced. For the garden only those fertilizers that have been carefully prepared should be used. Fertilizers of organic composition, such as barnyard manure, should have

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

A GOOD CANNING PEACH.

What is accepted as Tuscan Cling has proven to be a valuable yellow canning peach for Southern California. It is prolific and a comparatively regular bearer. It differs somewhat from the peach of the same name that is grown in the north in that it does not have so strong a tendency to grow double. In the northern part of the State it has all the way from one to five pistils which means that many peaches to one stem. That makes expensive thinning. If thinning is not done by hand with this variety as it is grown in the north it is not worth much. Fortunately in the south it has not this tendency. This renders it easily thinned by using the shears, which is no longer an experiment.

Canners are very anxious to have the growers plant this variety and those who have grown it are satisfied with it.

* * *

ROOT CUTTING IN HEAVY SOIL

On a recent visit to the Imperial **district,** we were much impressed **with the** difficulty the farmers had in **starting** cuttings of grapes and figs **in their heavy** soils. Where the same **varieties** were planted on the light **sandy** soils in other parts of the valley **a** stand of 99% has been obtained. There was considerable complaint **about** failures on the heavy land and investigation showed that too much water **had** been used. Fig cuttings planted ten inches in the ground were so rotten at the lower end that they were slimy and soft, while five inches below the surface they were green and **in** some cases throwing out roots, and shoots were starting from a couple of buds beneath the surface. Cuttings should be completly buried in the Imperial climate as the tops dry out before the roots can start. The farmers see the dried tops and conclude that they need water while the soil at the lower end of the cuttings is still sufficiently moist to grow them. Water is almost invariably turned on when it is observed that the tops of the cuttings are getting dry and then they receive a shock that usually kills them unless they are already sending out roots.

Conflicting opinions were given regarding the starting of vineyards. Some claiming that it paid better to plant cuttings, while others said that roots were the best. The latter method seems the best in any climate. There have been about as many failures with rooted vines as with cuttings, but the great fault as it appears to us is the improper use of water. It is cheap and abundant and easily applied and it is a great temptation to use it.

Land that is formed by deposits from overflow, as the Imperial lands are, will be found to consist of layers of light and heavy soil and it is difficult to get water to penetrate to any great depth unless the layers are broken up. One farmer who has a good soil can sub-irrigate his land forty feet from his irrigation ditches. This proves that he has a layer of very heavy soil at no great depth. Where there is such a layer within reach of the subsolier, and there are thousands of acres of such land, the subsoiler would do much toward filling the lower soil with water and not put an excess into the upper or surface soil. This does not imply that it is best to turn up the soil to a great depth, but if the subsoiler were run at intervals of several feet in the bottoms of irrigation furrows, it would allow a given amount of water to wet underneath and lower down than when placed in the shallow furrows.

These ideas are expressed in relation to the care of fruits or cultivated crops and do not of course apply to grain crops. These are necessarily grown on a wholesale plan and the soil cannot be manipulated after the crops are in. Nevertheless, the amount of water that is being used will serve a larger area than it does now if more care and work is given in preparing for the seed bed. This is no theory of ours. Some of the best farmers in the valley tell us that they have proven it by actual results.

CODLING MOTH.

The Washington State Experiment Station has issued a bulletin giving the results of several years' work on the Codling moth.

The first spraying for the codling moth should be given after the blossoms have fallen from the apple, but before the calyx cups have closed. This spraying is the most important of all. Experimental tests show that normally it means a loss of one-third of the apples to omit this spraying. The object of this application is to place poison below the crown of stamens, as it is at this place that nearly all of the early worms enter. To do this most effectively it is necessary to rain down a rather coarse spray from above the blossoms until they are drenched.

Unless a period of cold weather sets in immediately, the second spraying should be given two weeks after the first. The second as well as later spraying should be applied in as fine a mist as possible. It is important to use as much pressure behind the pump as can be maintained, for the more pressure the finer the mist and the better the penetration. The third spraying should be given in general from the middle to the end of July; the fourth from two to three weeks later.

Practical tests have shown that the best substance at hand for treating the Codling moth is arsenate of lead. This material can be purchased under a number of brands, as: Swift's Rex, Eagle and Disparene. All seems to be good. Three experimental applicatoins of Swift's Arsenate of Lead at North Yakima the past year yielded 97 per cent of worm-free fruit, while four to ten sprayings with Paris green gave less in each case.

Arsenate of lead in paste form contains about one-third as much arsenic-content as Paris green. Accordingly one pound to forty gallons of water should compare in strength with one pound of Paris green used with about 125 gallons of water. One pound of Paris green to 125 gallons of water is known to be the most effective strength to use Paris green in combating the Codling moth. It was the 1 to 40 formula of arsenate of lead that gave the 97 per cent of good fruit in the Yakima tests. It will be noticed that this is considerably more dilute than recommended by the manufacturers.

ASPARAGUS POINTERS.

It is from the atmosphere chiefly that the plants obtain the combustible part, while the 5 to 10 per cent of the incombustible matters or ash is obtained exclusively from the soil, although the ash constitutes so small a part of the entire plant, yet the elements composing it are indispensible, for without them the ingredients obtained from the atmosphere could not be taken up by the plant.

The three elements that are the most important are nitrogen, phosphoric acid and potash. In many instances, either from one-sided cropping or natural deficiency, one or other of these elements may be markedly deficient. Under such conditions plants fail to give the largest possible returns, and need special fertilization.

Asparagus is one of the crops which makes an extremely heavy draught on a soil, and one which responds readily to rational feeding.

Practically all of the experiments recorded for the use of fertilizers on this crop have shown enormous returns from the judicious use of fertilizers.

The preparation of an asparagus bed requires the outlay of considerable money, but the planting is expected to last for fifteen to twenty years, and consequently all the work should be done in a most thorough manner.

The soil should be a sandy one, or a light loam, warm and deep. It can hardly be made too rich for this crop, some expert asparagus growers using 1000 pounds and more of fertilizer per acre. The object of such heavy use of plant food is to force a rapid growth of large, crisp stalks, which can only take place when growth is unchecked at any stage.

If the object is to grow white stalks, furrows should be opened, some four feet apart and at least eight inches deep. Plants should be set twelve inches apart in the row and arranged so as to be in a natural position. At the outset the roots should not be covered more than two or three inches, but as the shoots get older the furrows may be gradually filled. Clean culture is an essential for success.

All fertilizing should be done just before the plants begin to shoot. While stable manure is used very heavily yet there is often much trouble from weeds, thus introduced into the soil.

A fertilizer combination that is suggested is:

Dried blood	300 lbs.
Bone superphosphate	800 lbs.
Muriate of potash	300 lbs.

Of the above mixture from 800 to 1000 pounds per acre can be used. Whatever the source of the plant food the nitrogen and potash supply should be very liberal. Commercial asparagus beds are usually cut for about three months, and this long period of removal of shoots reduces the vitality of the plant, so that unless the plant is stimulated and fed, the succeeding crop is likely to show the effects of heavy cropping. Fertilizers, however, cannot take the place of tillage. They can only supplement it. This is a truism which holds for asparagus as well as other crops and should be heeded accordingly.

In cutting asparagus the knife should be so manipulated as not to injure other shoots as each injury so inflicted reduces the profit from the plant. The shoots are then bunched and tied, and the butts cut off squarely with a sharp knife.—George Wright.

SALSIFY.

This vegetable is coming more and more into use, and every one should give it a trial. It is easily grown, which fact is not generally known. The seed is sown in early spring in drills. The plants need thinning out, should they come up thick. They are not hurt by frost, and can remain in the soil all winter if desired, and then be dug out in spring. Some dig them late in the fall and store them in the cellar, or in a trench outside, to be used at will throughout the season. It is sometimes called the oyster plant, from its resemblance in flavor to that of the oyster.

THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—*30 cents per foot and prepay the freight.*

CHUNK HONEY.

This is an article that we seldóm see now in any of the best markets of America, yet in the old days, even of fifty years ago, it was no uncommon occupant of the best marts of our land, and that in even the large cities. By chunk honey we mean irregular pieces of comb honey cut from the broad frames. It has little to recommend it and much that should relegate it to the shades of the long ago. It is cut from any portion of the hive in irregular shapes, and has no attractiveness of form. Again it is always more or less travel-stained and so is decidedly without color beauty. Again it will generally contain some, often much, pollen, or bee bread, and so will, if carelessly eaten, give the bitter taste that makes pollen so distasteful. In America we demand that our table supplies look well and often are as anxious for this as that they taste well. I think that we often put appearance ahead of real excellence, else why do such apples as the Ben Davis win purchasers, and hang on to production? We love to set before our guests viands that captivate the eye, and are hardly less eager that our own dear ones of the family shall have that which pleases the eye no less than the palate. America has no superior and I believe few rivals in her skill in the makeup of the table. The clean spread, artistic arrangement, usual bouquet of finest flowers, and last but not least, the beautiful table articles, which often look as well and sometimes better than they taste, make the American table a thing of beauty, and I hope usually joyful. Thus it is that the comb honey of America in the elegant sections, white and clean as the fresh fallen snow, pollen-free, and so always sweet and delicious, captures the aesthetic American housewife and is popular, as it deserves to be, for it adorns the table no less than it pleases the palate.

In beautiful Berlin, we see this chunk honey anywhere and the beautiful sections very rarely indeed. And yet this ugly chunk honey sells for as much here as the incomparable sections bring in America. The Berliners show most commendable taste in their architecture and landscape gardening. The city is full of palaces, indeed, it might be said truthfully that the entire city is a group of palaces. The parks are also very numerous and of wonderous beauty. They show the real essence of beauty as seen in our great forests and everywhere, scattered thickly throughout the wide streets, we see lawns, shrubs and flowers arranged as by master artists, with circles, ovals and squares, generously distributed, and so elegantly planted that one can but think of the city is a veritable fairyland. The flower stores are also exceedingly common and full of the rarest and most exquisite bloom. Here we can learn of the Berliners. They surely have great taste as seen in their love of flowers and art. Yet in the table and food products, I can but believe that we are in the lead. In all these respects it is most wise that we should work for the beautiful. Let us, if possible, improve still more our wonderfully beautiful section honev, and never more offer to the trade the ill looking and unsavory chunk honey that was the all of our fathers, we do not need to say grandfathers, and which is still to the front in many leading European cities.

There is just one recommendation for chunk honey. It can be secured with little work and hardly more of thought. But the day when success comes with no exercise of brain is long since past. We of America may take pride in the fact that as a people we lead decidedly in thoughtful enterprise. In the exercise of brains to secure the most beautiful and the best in every desired quality, we not only add greatly to our gains financially, but we make our manual pursuits a fascinating pastime rather than unattractive, irksome drudgery.

* * *

INTENSIVE AGRICULTURE.

I came to Europe expecting to study intensive agriculture. I had been led to believe that in method and production we of America were far in the rear. Yet I am fully persuaded that in the citrus orchards of California, especially the best conducted ones, and they are certainly in very generous proportion. we have a system of intensive agriculture rarely equalled and certainly unexcelled in most if not in nearly all Europe. In our deep thorough cultivation we far excel England and France, though in this I believe we are still behind much of Germany. Though Germany gave us the idea of nitrification of the soil bv bacterial germs, and the principle of soil inoculation, that we may gain the rich stores of nitrogen from the air, yet it is our own scientific experts that have perfected the method of applying this information, and today our growers lead the world in the intelligent use of fertilizers and in the application of that great discovery in modern agricultural practice, the enriching of the soil by the free planting of legumes that we mav win to our aid the millions of bacteria that constantly work to enrich our soils with the ever necessary but costly nitrogen. In our shipping and the handling of our fruit, we are surely way in the lead, else our splendid California fruits would not be in all Europe's best markets, and as universally praised as "the best" by the dealers. In skill and neatness of pack we can teach those of any and all other countries.

Yet in our general agriculture, as for example, in the beet field, we find in Germany a condition much in advance of our own. Here they feel that the land is too scarce and too necessary to have any lapse in production, and so we find the vacant places in rows, so frequently in evidence in our own land, practically wanting in Germany. As I showed in a former article, this may be due in part to a more generous use of seed, better tillage, and especially deeper plowing and the entire curtailment of weed growth. They also find that they must use very generous applications of commercial fertilizers, and this practice is almost universal in the German beet fields. In all these matters our beet growers will, if they are wise, pay most earnest heed.

In one respect—in this intensive line—we are immeasurably ahead of all Eurone. Our soil tillers generally own the land, and are almost always alert, intelligent, and often well educated. Thus the men who really do the work are thoroughly informed as to the latest discoveries and the best practice of the day, and are in condition and way to still improve in greater reach all the various manipulations and methods of farm management. In the intelligence, thrift and enterprise of our agricultural population we are away ahead of Europe, and in this I believe is our best hope and greatest glory as a people and a nation.

* * *

STREET IMPROVEMENTS.

I gladly note that there is a great improvement all over California in the matter of tree planting in cities and along the roadsides. Surely this is timely and wise. We can hardlv plant too many trees. These should be carefully selected. We must have those that will thrive in our climate, should select the most beautiful species and I believe are most wise in planting but one specie on a single street. Eurone, even though so old, has in many sections more trees than we can see in large portions of America. We may well believe that the ample rainfall of Europe is largely due to this generous provision for tree growth. Europe may almost be said to be one great park so common and numerous are the growths of fine trees. It is probably true than in no way can we help California so much as to foster this habit of tree planting. As we ride through most sections of of Europe, we seem to be in or near dense forests most of the time. Would it not be wise to form societies all over our State which should make it their pleasure and duty to arouse interest in this question of more trees? This will not only make the State more beautiful but it will tend tremendously to strengthen us where we are most weak. More trees mean more rain. T. P. Lukens in his generous, unselfish interest in this matter has wrought grandly for our State. We rejoice that his generosity and work has won the appreciation of the government and trust that he is in way of doing even more to reforest our mountains. We must not be asleep regarding the importance of far more numerous and extensive forest areas.

"Beside the Bonnie Brier Bush" has attracted the attention of the world to the Ayrshire rose of Scotland, "which bloomed in the gardens of Drumtochty" where the scenes of this gem of idylic literature were laid. The Ayrshire and its closely allied Dundee Rambler are pure white in hue, exceedingly hardy and the foliage is shining green, similar to our Cherokee rose.

END OF THE PEAR BLIGHT WORK.

On the completion of their work on pear blight in the northern part of the State, the corps of experts under direction of Professor Waite were withdrawn, but Professor Dean B. Swingle was left for the purpose of checking up the work and reporting on the efficacy thereof. Prof. Swingle has now completed his work and left for Washington on May 30th. He reports that, as a rule, the work has been very thoroughly done, and in the orchards where it has been so done, there is very little showing up, and it is his opinion that another year's 'strenuous work, followed by careful watching on the part of the horticultural commissioners hereafter and the removal of the blight as soon as it is seen, will keep it out of our pear orchards and save this great fruit industry to our northern counties. There are still some few orchards in some of the counties that have not been treated owing to obstinacy on the part of the horticultural commissioners, and these are threatening dangers where they exist and the blight has shown up in them to an alarming extent. A special appropriation has been made in Washington for the purpose of continuing this work through the Department of Agriculture next winter, and it is probable that some stringent laws will be enacted by the coming legislature to reach recalcitrants, and means, may be had by which the disease may be thoroughly checked, if not eliminated in the northern pear orchards.

* * *

NEW INSECTARY COMPLETED.

As stated a short time since, the insectary of the State Horticultural Commissioner at San Francisco was very badly wrecked by earthquake and I notice that some papers speak of it as being a total loss. This is incorrect, for while the loss was very great, enough has been saved from the wreck to get a new start and in a few months there will be an ample stock of parasites for distribution again.

A temporary insectary has been erected at Sacramento and put in the charge of Mr. E. K. Carnes, who is now busily at work along the old lines. Conditions here are better for the propagation of insects than they were in San Francisco and it is probable that some effective work will be done. It was arranged some time ago to build a good, commodious insectary on the capitol grounds, but serious objections were raised to it as it has been determined to put up no more buildings on these grounds, but rather to remove those already there and convert them wholly into a park. For this reason the proposed insectary could not be built, and the one now in use is a temporary structure which will be used only until better quarters can be provided. It will answer all purposes, however, and the supply of beneficial insects will shortly be sufficient for all demands. All applications for beneficial insects should be addressed to Sacramento.

* * *

UNSEASONAL AND INJURIOUS RAINS.

Heavy and unseasonal rains have fallen in the upper part of the state, doing much harm and little good. The hay crop, which was being cut in many sections and in all parts was ready for the sickle, has been very greatly injured. Late grain may be helped a little, but the early grain, which was in the milk, will not be benefited much, if at all. Cherries have been seriously injured by the rain as this crop is now ripening rapidly, and the rain will cause the fruit to crack to a large extent. The cherry crop has turned out very well and heavy shipments are now being made. Early apricots have already appeared but the crop will be a light one this season, and heavy winds have whipped off many of the young apricots.

* * *

ORANGE GROWING IN SAN FRANCISCO.

I noticed a statement in a Riverside paper a few days ago that no navel oranges had ever been grown within a hundred miles of San Francisco. I have gathered and eaten navel oranges from trees in the city of San Francisco itself. An old sea captain by the name of Partridge, bought some property on the bay within the city of San Francisco, and turned his attention to horticulture on a small scale. Among other things, he planted several navel orange trees, and I have visited his place and picked the fruit from them and the trees did well and produced a fairly good article of fruit. In an orchard washed by the waters of the bay, while in sections all around the bay in Alameda county, Santa Clara county, and San Mateo county, navel oranges can be found quite frequently in full fruit. I have seen a number of these all through San Mateo county in full bearing and giving good results. It is true that the fruit is not so good as that grown in Southern California or in the interior valleys, nor is it grown on a commercial scale, being grown principally for a curiosity, but for all that, the navel orange is grown in and around San Francisco and a fairly good article is produced.

* * *

LOCUSTS APPEAR AGAIN.

Reports are coming in from portions of San Joaquin county to the effect that the grasshoppers have already made their appearance, and the annual grasshopper scare is being gotten up again. So long as we have any uncultivated foothill sections so long will we have swarms of grasshoppers every year in some part of the state. The gently sloping, gravelly foothills of the mountain ranges, which are practically worthless for anything but pasturage, and are not very good for that, form ideal breeding grounds for the grasshopper, and so long as these are allowed to remain uncultivated, there will be swarms developing, and we will read the same story each year.

These swarms do considerable damage to the area immediately aligning their breeding grounds, but are not nearly so serious as the Rocky Mountain locust of the East, and it is to be regretted that so many of our newspaper accounts are so florid in their description of them that one would think that the entire agricultural resources of the state were about to be destroyed by grasshoppers

The truth is, that we have swarms every year; that they do not usually appear two years in succession in any one location; that the area of destruction is comparatively limited, and that there is no danger whatever to be feared by the state at large from an invasion of grasshoppers or locusts. It is well, however, to reduce these swarms and destroy them to as great an extent as possible wherever they appear, and this may be done by burning over the section where they are breeding, while they are in the hopping stage and before they acquire their wings, to capture them by means of a machine known as a "hopper-doser", or to poison them with the bran, arsenic and molasses compound. Any of these methods will destroy them in large numbers, and, of course, the greater the number destroyed, the smaller the future swarms will be.

We have in California a parasite—a tachnid fly—which attacks them in the flying stage and reduces them very materially, but, unfortunately, there are always enough left for the future crop. However, no one need fear an attack of grasshoppers outside of the immediate limited area adjoining their breeding grounds.

* * *

THE SUMMER SCHOOL AT BERKELEY.

The special rate of one fare plus two dollars for the round trip to Berkeley, which was made by the railroads on account of the National Educational Association Convention, will still be available to the students of the University of California Summer School, which opens June twenty-fifth and ends August fourth. The tickets will be on sale at all stations June tenth. Prospective students will pay full fare to Berkeley and take a receipt for it. Upon certification by the recorder of the faculties that they have been in attendance at the Summer School a return ticket will be sold to them for two dollars. The return trip may be made at these special rates any time up to August thirty-first. The time limit of the tickets gives one ample opportunity to study the unique situation in San Francisco either before or after the Summer Session. There are plenty of accomodations in Berkeley, and board and lodging may be had at very reasonable prices. It would be well, however, for students to write to Recorder James Sutton, California Hall, Berkeley, California, and arrange to have reservations made for them. The Summer School will be conducted along exactly the same lines as though the San Francisco calamity had not occurred and from present indications the attendance will exceed that of any previous year.

FARMERS NATIONAL CONGRESS.

The meeting of the Farmers National Congress at Rock Island, Ill., next October, opening the 9th, will afford an opportunity for a most pleasant outing, to say nothing of the valuable program to be presented. Rock Island is beautifully located at an attractive point on the Mississippi river at the foot of Rock Island rapids. Aside from the fine scenery in the city and immediate vicinity, it is surrounded by an ideal agricultural country and is the site of improved dairying industries. At this place is located Rock Island arsenal, the largest in the world, and Back Hawk's watch tower, famous in Indian history and legend. In addition there is an abundance of parks and drives. The Western and Central railroad associations have made a rate of one fare plus two dollars for territory. The Trunk Line association will charge a fare and a third through its territory—Pennsylvania and New York. Other association have made liberal concessions. An excellent chance is offered for an exceedingly delightful, cheap and instructive excursion. Pay full fare going and take receipt from your local agent. J. M. Stahl, Chicago, Ill., president; Geo. M. Whitaker, Boston, Mass, secretary.

The Pomona Fruit Growers' Association, having discontiued fruit drying, have on hand 9000 drying trays, 500 picking boxes, and two graders which can be had at a great bargain by addressing R. D. Russell, corner Phillips and Ellen Sts., Pomona, Cal.

With the Citrus Growers

BY J. W. MILLS

GUM DISEASE.

The appearance of gum disease on orange trees should be quickly followed with some treatment that will check it. There have been various recipes for washes, those most highly recommended having some carbolic acid in the mixture. A good one is equal parts of quick lime and sulphur by weight mixed well and enough crude carbolic acid poured over it to slack the lime and leave the mixture thin enough to apply with a brush. The slacking of the lime with the sulphur creates sufficient heat to thoroughly incorporate the two, thus giving a double value to the fungicidal properties of the wash.

Some four or five years ago, Mr. S. A. Baggs, horticultural commissioner of Tulare County, published a recipe which met with high favor in his district. It was a solution of equal parts of beeswax and resin, boiled together and applied hot with a paint brush.

The precaution always given in preparing the tree for the wash is to prevent the spread of the disease by carefully collecting the bark and chips of wood scraped from the diseased parts. All the abnormal tissue should be cut out and burned. It will be noticed that there are always granular particles that are thrown out from the bark. This bark is green where the disease is first making its appearance but there will be small openings that penetrate into the wood beneath the diseased tissue and into the healthy part. These should be opened up and the bark carefully scraped so that the most remote parts will receive the wash. The green bark should not be removed as that would leave an ugly wound that would very much weaken the tree.

If the disease is contagious as it very likely is, an application of the wash before scraping would disinfect the most of it, especially if the scraping were done while the wash is wet.

* * *

CITRUS FRUITS ON THE DESERT.

We always supposed that citrus fruits would have a hard tussel with the wind and frost one hundred and fifty feet below sea level where the thermometer ranges or is supposed to range from 130 to 15 degrees.

However some Riverside capitalists have recently planted 75 acres after having demonstrated that they could grow early oranges there. Later we discovered at Brawley, in the heart of the desert, young orange trees and also bananas growing and appearing to be in congenial surroundings. The bananas are now in bloom and show no ill effects of having passed through the winter in the open, except that the leaves were badly tattered by the wind. The owner is now growing a eucalyptus hedge around his plantation and is spreading out in the banana business, having planted all of his offshoots. Last summer his only bearing bananas tree matured fruit three inches long but this was lost in a gale that took his tree along down the valley. We were somewhat surprised to see such tropical vegetation live through the winter. We were told that tomatoes were harvested all winter in the open but that they do not bear during the hottest part of the summer.

All these features present an encouraging prospect for early oranges, earlier than the northern part of the state can ever hope to produce, yet it has not been demonstrated to a certainty that oranges can be profitably grown there on a commercial scale. There will no doubt be many mistakes made and many failures, still these things will be demonstrated one way or the other in much shorter time than it took to settle such questions in the acknowledged citrus belts.

* * *

PRUNING CITRUS TREES.

From now on is the time of growth for citrus trees and they will grow so rapidly that the shoots will bend right over with the superabundance of large heavy leaves. Where there is a tendency to this it can be stopped by pinching the top of the shoot. Especially is this the case with lemons, which require constant watching to prevent getting topheavy. Do not prune severely in the height of the growing season, but rather wait until later on in the fall or early spring. Where trees have been rebudded they will require constant attention all summer to get the growth where wanted. If the trees have been large and been subjected to the beheading process, all growth must be kept off except what comes from the new buds, and the object should be to get a good growth of healthy wood that will be well matured before winter.

SOIL AIR.

A proper circulation of air in the soil is just as important as any other factor of plant growth. Nearly half of the volume of ordinary soils is occupied by air spaces. The air spaces in the soil wind in and out between the soil particles, just as they do in a pile of larger stones. If the layer of water on the surface of the soil grains becomes so thick as to stop the air passages here and there the soil is then too wet for most crops and needs drainage. Plants have no special breathing organs, the oxygen required in their breathing finding entrance all over the surface of the plant. Plant roots must therefore be supplied with air, and hence the soil must be porous enough to permit of free circulation of air. A good supply of humus and proper tillage will accomplish this result in clay soils. Sandy soils are usually too porous, needing humus to help them retain water.

Another reason why air must circulate freely in the soil is that large quantities of oxygen are required to insure proper decay of organic matter to supply plant food. Also, carbonic-acid gas is produced by the decay of organic matter, and this must escape easily to make room for the atmospheric oxygen needed in the soil. The movement of air in the soil is frequently shown by the bubbles which appear at the surface of the soil just after a hard rain. As the water soaks into the soil it drives the air out, and bubbles may be seen at the surface if water enough is present to form them.

One of the most important objects of plowing is to loosen up the soil and mix fresh air with it.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

CARNATION CULTURE.

Being a surface feeder a light sandy loam is the best soil, although if thoroughly mulched, any ordinary garden loam will produce good bloom. Use decomposed cow manure Lighten your soil well before planting and give a thorough surface dressing of cow manure after planting and twice a year thereafter. Do not stir soil deeply, but lightly rake over the surface after watering. Being a surface feeder, this plant requires an abundance of water, yet requires good drainage.

Planting Season.—The months of March, April and May are the best in which to plant thrifty young plants, which should have been rooted during October, November and December. These plants will give excellent bloom during November and onwards for one year, and then usually deteriorate.

During the fall and early winter a strong young field plant carefully removed to the garden, will keep on blooming and growing luxuriantly. Do not take an old pot-bound plant at any time—you can easily detect it by its thin, spindly growth.

Keep the newly set plants well cut or pinched back, not allowing flowering stems to form earlier than October.

In picking bloom do not hesitate to cut with a long stem, the plants do better when freely cut as their tendency is towards over productoin of blossoms, rather than otherwise. If extra large blooms are desired disbud all but the terminal flower bud upon each stem.

Fertilizers.—For all general garden purposes nothing will equal good cow yard manure, put on twice a year to the depth of about two inches and gradually worked into the soil. Once each year an appleiation of wood ashes will be found highly beneficial. If in a friable, well-drained soil, carnations will use an abundance of plant food.

FARMERS' YARDS.

For the farmer's yards, I do not advise hanging baskets, for they require a great deal of care. If you want plants that are small, plant them in the ground and not in mid-air, put them in the earth where you won't have to water them so often. And instead of having hanging baskets on your porch, grow vines.

In a climate of this kind we want plants that are best adapted to it. I know what you have to contend with and your want plants that are drought-resistant. You must plant petunias and California poppies. You must cling to the native plants of all sorts. The matter of the flower garden in this clime is one for you to work out yourself. In the city. gardening is more favorable to a larger range of plants for there you have better architecture, curbed streets, etc. But out here in the country, you need the softening forms of trees and hedges to hide the angles and defects in architecture. Have everything in sympathy with its surroundings. Don't make the mistake of having things too exact; don't lay out flower gardens in little beds, but have little masses of flowers dotted here and there. Do not fill up your land in a conventional manner, but so arrange your flowers and flowerbeds, so that it will look natural, and as though the hand of man had not been there at all.—E. B. at Upland Institute.

PRICKLY PEAR CACTUS.

Expermients have been conducted by the Queensland Government to investigate the most satisfactory method of eradicating the prickly pear upon land which had been invaded by the persistent growth of the plant. The ground selected was very steep and covered with an almost impenetrable mass of cactus. The men employed were protected against the sharp needles of the plant with leather leggings, and were armed with specially constructed mattocks with which they chopped the plant to the ground. The leaves and stem were cut into small pieces and sprayed with a solution of sodium arsenic. Under this treatment three or four days after the applicatoin of the spray the plants became brown, in which withered condition they soon rotted and disintegrated. The spray appears to have had no deleterious effect on other vegetation, although the roots of the cactus were so thoroughly destroyed that some months after the experiment no new growth was observed. The spray used was composed of four pounds of white arsenic and three pounds of washing soda, boiled for half an hour in one gallon of water. Of this concentrated solution about six ounces were used to a gallon of water for spraying.

INSECT POISONS.

Garden insects are a great pest and many and various are the methods employed to get rid of them. We give below three recipes for poisoning these pests. The writer has used, at different times, all three for the destruction of wood lice or "sow bugs" in greenhouses.

To a pint of cornmeal, add enough brown sugar to sweeten, mix well together and add one tablespoon of Paris green. Moisten a little with water, just so it will hold together. Place the mixture about in small quantities wherever the bugs may be.

2. Take one pound of Paris green one pound of ordinary flour, one quart of well-slaked lime. Mix well together and diffuse with the powder bellows.

3. Mix Paris green with powdered sugar until the sugar shows a greenish color. Distribute it in the evening (in little pinches) near the hiding places of the sow bugs, and if all is eaten next morning, repeat it until all the sow bugs are destroyed.

STREET TREES.

This is a subject of vital importance to everyone in the neighborhood who is interested in the public improvement. You have in Euclid avenue one of the grandest avenues that you can find in Southern California, and yet you are frittering away your lives without doing a thing to it that would make it of greatest charm to the tourist. If it was planted in the same manner as the streets in Riverside, railroads would make it a regular stopping place for tourists to see it. The pepper trees should have vines and plants put around. interspersed with poppies and geraniums to lend a dash of color. Geraniums are not given their proper value. It is the geranium, pepper trees and palms the tourist wants to see, and he will go where he can see them.

In Riverside, the streets are undergoing wonderful transformations. Miles and miles of poppies and sweet peas are being planted and the streets beautified. The people there will not sell an acre because they know what an impression this beautiful landscape will make upon the people. The tourist will go there.

You have nothing of landscape beauty to show him. Fix up Euclid avenue and then the other streets, and you will have, as I said before, one of the grandest avenues in Southern Calfiornia. It will be of interest to the toursit and will bring him here. If you will all do your share in the matter of co-operation, you will soon find that the tourist will come and settle amongst you.—E. B. at Upland Institute.

THE GRASS FAMILY.

That wheat, corn, oats, barley, rice, etc., are grasses as much as the blue grass of the lawn, is a matter of general information perhaps too common to mention, but it may occasion some surprise to find the bamboos close to blue grass, and closer to fescue grass. Bambusa guada attains a height of sixty to a hundred feet and the spaces between the joints are filled with pure cool water. A few clumps of this grass would make a pretty good water system for a small family.

PISTACHIO NUTS.

The favorite confection, which is also much used in pharmacy, is the seed of the fruit from Pistacia vera, a tree of Persia and Syria. It is cultivated throughout the Mediterranean region and has, from far back, been much used in the East to perfume the breath, the resin of the tree even exceeding the nuts in aromatic properties. This resin is obtained by incisions of the trunk and is called mastic.

GROWING FERNS.

In such an equable clime as ours ferns should play a more prominent part in the decoration of the home, whether out of doors, in the living rooms, or the heated conservatory. The most common mistake made in handling them is the failure to provide proper drainage and for this reason we advise raising the fern beds at least six inches above the common level.

FREE SEEDS.

Nothing that has been before congress this session, not even the statehood bill, has evoked such a show of passion as the 1-cent package of seeds. The other day Congressman Lilley, of Connecticut, had on his desk a big bunch of letters from farmers of his district, replies to some of the 12,000 letters he sent out trying to learn the sentiment of his district. "You're a good fellow, but your seeds are no good," one man wrote. "I don't want the seeds," another said, "but please send me an Ayrshire bull and $25,000." "If the government has any more seeds to send me," said another, "I'd prefer to have their value in cash or postage stamps."

MARECHAL NEIL ROSE.

This beautiful rose, the first of its class (appearing in 1867), was so named after Marechal Neil, a distinguished French marshal, who was born in 1769 and shot as a traitor in Paris in 1815. He was a prominent figure in the army from 1787-1815, was made peer after the restoration of 1814 by Louis XVIII, but deserted to Napoleon in a few months and commanded the Old Guard at the battle of Waterloo. He was afterwards tried by the House of Peers, condemned and executed.

When planting trees and shrubs on the lawn for permanent growth, keep in mind the habit of the trees. Make the tops smaller than the roots of trees that are transplanted. Remove all broken roots when the trees are set. Cut broken parts off with a sharp knife.

For the hottest. driest place in your garden, get a plumbago, either the blue or the white. It will stand any possible heat or drought in this section.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE FARM GARDEN.

If the garden is planted all in a day, to get the disagreeable job out of the way, it is probable that only one or two species of plants will do their best. Some will have been planted too early and others too late.

For best results in garden making each kind of plant should be out at the time when conditions are best suited to it. Peas, parsnips, spinach and some other species should be planted as soon as the soil can be worked in the spring after the hardest winter rains are over. Seeds of all these will germinate, and even make stronger growth, when the soil is only a few degrees above freezing. If we have frosts more or less after they are planted no harm is done.

Other plants like beets, potatoes, carrots, etc., have a larger heat requirement and should be planted a little later, or at least later than the first mentioned list. They will not endure well if put out on the days when the ground is still being frosted, but they should be planted before the soil gets too warm.

Corn, beans, melons, cucumbers, tomatoes and many others require a warm soil and time will be gained if they are not planted until the soil is well warmed up to a considerable depth. If put out too early the seeds are liable to decay in the soil. Even if the plants do grow they will become stunted by the cold and will not develop into good plants. It saves time to plant these warmth-loving kinds after the soil is warm.

Some species need a great deal of heat. These are lima beans, okra or gumbo, egg plants and some others. They should be the last vegetables planted. Still other species should be planted at intervals so as to get a succession of vegetables for the table. Most kinds which grow quickly may be planted in succession nearly every month in the year. Radishes, beets, lettuce, peas and many others are succulent. Seeds of these may be planted every few weeks, so as to have them tender nearly every month.

SETTING CAULIFLOWERS.

The rows are three feet apart, and the plants are set about eighteen inches distant in the row. It requires more caution to set the plants out in time, if kept in the plant bed too long. The plants should be set out as soon as they are large enough to handle easily. For this vegetable it is better to make three different sowings, about ten days apart, so as to be sure to have plants in good condition when weather is favorable for transplantings.

The vegetable must be treated more nearly like early cabbage than like the later. The soil needs to be richer and deeper than for cabbage. Plants must not be allowed to be checked in their growth at any time, as they are liable to run to seed, just as they are when allowed to remain in a 'hot bed too long.

DESERT ONIONS.

The Bermudas in the Imperial and Coachella valleys are later than was expected and later than was the case last year. To secure the best prices, the Bermuda onions should be on the market in March or at least early in April. The growers next season should plant seed in September, if possible, or even earlier. Doubtless it will pay them well to experiment until they find they can put onions on the market before the greatest part of the Texas crop is sent out. This they have not yet succeeded in doing.

.. TO POISON CUTWORMS.

Thoroughly mix, while dry, one pound of Paris green and fifty pounds of wheat bran; make moist but not sloppy, by adding water in which a quart of cheap molasses has been dissolved. Place this mixture in spoonful piles where the worms are working. It attracts the worms from the plants.

HOW THE GARDEN PAYS.

It is certainly true that the garden pays. It pays because it provides healthful, out-door exercise, because it supplies the table with toothsome vegetables and because it improves and beautifies the home and makes life worth living.

CHINESE CABBAGE.

Cabbage is a most important vegetable in the estimation of the Chinese but it is not our cabbage nor any of its many forms, such as cauliflower, broccoli, kale or Brussels sprouts, but oriental species, now known by botanists as Brassica chinensis, B. petsai and B. juncea.

These cabbages are much used as an addition to soup and meat stews, evidently being added at the last moment, as they are so lightly boiled that the green color of the leaves and the crisp, pungent mustard-like flavor are well retained.

KHAMA MELON.

This curious little stock melon came from the Kalahari desert in South Africa, and in its native country is said to grow well on exceedingly arid soil. At the Pomona substation, without water, on sandy soil, it yielded at the rate of twenty-two tons to the acre and cows and horses ate them readily. California reports are various.

FENUGREEK.

This is an old plant of the Mediterranean region. It is of the clover tribe: an annual, which under favorable conditions, produces a heavy weight of stem and foliage. It is used in the old countries for hay-flavoring; the seed also has aromatic qualities and special uses in veterinary medicine.

COMMERCIAL PEPPERMINT.

The yield of peppermint to the acre varies greatly according to conditions. The yield of oil runs ten to fifty lbs. to the acre, averaging 15 to 25 lbs. The chief producing section is southern Michigan, with moderate quantities of oil also distilled in northern Indiana, and one county in New York. Domestic output is obliged to compete with Japanese oil.

Onions may be grown on high ground in a dry season by the new culture, while under ordinary culture, it would be a complete loss of seed, time, money and use of land.

MAGNEROSA TOMATO.

The New Jersey experiment station has a tomato, Magnerosa, which is a cross between Ponderosa—a standard, very large variety—and Magnus—a fine pink fruited sort. The cross has been carried through three seasons and is considered very desirable in form and quality.

WATER CRESS.

Water cress may be successfully grown on ordinary garden soil without the aid of running water. When water is laid on from pipes, water cress will thrive as well as in a running stream. To cultivate on ordinary soil, prepare a bed of good mould about six inches deep. Smooth and water it in the evening, and next day reduce the soil to a fine tilth. Mix the seed with fine sand, and sow as evenly as possible, and cover very lightly with a thin layer of mould. Press the seed down, water, and cover with matting. The plants soon grow; by and by they flower, when a new covering of mould is given them, leaving the plants about one inch above the ground. Then water freely. Ten days later shoots will appear springing from the roots, which, when two or three inches high are removed and pricked out three or four inches apart in a new bed. A fortnight later the cress will be six inches high, when cropping may begin.

CABBAGE SOILS.

Select a well-drained and comparatively light soil and give it plenty of manure, at the rate of seventy-five tons to the acre, if possible. The soil should be thoroughly prepared, and to a depth of at least ten inches. The ground occupied by this crop can be used for a succeeding one, immediately after harvesting. Where the land is very valuable, many also grow radishes, spinach or lettuce between the rows, and by so doing, make these catch crops pay for the manure used.

DISEASES OF THE TOMATO.

In Farmer's Bulletin 220 of the United States Department of Agriculture, the following information and suggestions are found:

Leaf spots and leaf mold, two fungous diseases, of similar nature, are marked by the appearance of small, round or irregular spots on the leaves, causing them to turn and finally die. Both are easily prevented by spraying with Bordeaux mixture. The application should be given soon after the plants are transplanted, and be repeated at intervals of ten days through the season.

Fruit rot is combatted with more or less success by training vines to admit light and air, together with the destruction of all diseased fruits, to prevent the spread of infection.

Wilt, principally a Southern trouble, is due to three distinct parasites. The Fusarium wilt, the most prevalent in southern Florida, compels rotation of crops. Tomatoes in this section should not be planted on the same land oftener than once in four or five years. The Eclerotium wilt attacks tomatoes and many other vegetables in the Gulf States and requires rotation of crops and the destruction of diseased plants. In the autumn dead plants and decaying matter of all kinds should be removed from the garden and burned. The bacterial wilt, the most common tomato disease from northern Florida to Maryland, is spread mainly by leaf-eating insects though the infection probably remains in the land as well. Spraying, with Bordeaux mixture and Paris green, together with the destruction of diseased plants, as soon as observed is advisable.

Root knot is characterized by the formation of irregular galls on the roots of infected plants, due to the invasion of minute nematodes or eelworms. Most garden crops are attacked by this disease, but tomatoes are especially susceptible. They should not be planted on infected ground. Rotation with crops that will not harbor the worms tends to free the land from this disease. Nematodes are not troublesome in the field except in the south.

Western blight or yellows, prevalent in the Rocky Mountain States, is due to a cause not yet fully known, though prabably connected with unfavorable soil conditions. These should be improved by drainage, fertilization, cultivation and irrigation, and great care should be used in transplanting not to injure the young plants.

Alfalfa Ranch Wanted Have a customer for a nice alfalfa ranch and home. What have you? ***White & Newby,*** 404 Hellman Bldg, Los Angeles, Cal.

The Coming Harvest.—The California farmer, no matter what his crop, will doubtless have abundant cause to rejoice when this year's crops are garnered. The outlook is most excellent for heavy crops in all parts of the State. The grain harvest, now upon us, is calling for all the available help obtainable, with the supply far from meeting the demand. Farmers in Centra California are already complaining of the shortage of labor

The San Francisco disaster will doubtless work to the injury of the farmers thereabout because of the great amount of labor needed for reconstruction and the allurements that city life has for the average working man. In this day of short hours, with improved machinery to relieve the workers from the heaviest part of the toil, it is little wonder that the farmer is short of labor. We still have too many farms where the workday begins at 4 a. m. and ceases only with darkness. This "workday" has come down to us from the "good old days" sentimentalists are so fond of ranting over. When the farmer will grant the same hours, pay, quarters, etc., that the ordinary laborer obtains in the city, then, and not till then will farm work prove attractive. We are aware that many farms have ideal conditions but there still remains many rural employers who consider that sixteen hours constitutes a workingday.

* * *

The Fortunate Farmer.—It has been no late discovery, that the farmer is more fortunately situated and should be more content than his neighbor of the city or town. Long years ago the poet, Alexander Pope, penned the potent truth:

"Happy the man whose wish and care
A few paternal acres bound,
Content to breathe his native air
In his own ground.
Whose herds with milk, whose fields with bread,
Whose flocks supply him with attire;
Whose trees in summer yield him shade,
In winter fire."

During these days of pure food investigations and the attendant revelations, the farmer has good cause to rejoice that his fields and flocks supply him with a large part of the necessities of life. From some of the recent horrible disclosures made by the government experts in investigating the beef trust, it would seem that we must nearly, if not entirely, deny ourselves the use of meats, fresh, or "embalmed," unless we have absolute knowledge of its source and this must not be far removed from the farm.

A recent government bulletin says:

> "The demand for information on this subject (food adulteration) is now very general and, as is often the case when public interest in deeply aroused, there is an unfortunate tendency toward exaggeration which frequently amounts to sensationalism. Such an attitude is to be deplored, and unless it is checked must sooner or later react unfavorably. It is not unusual to speak of some of our typical foods as poisoned, and of food manufacturers as poisoners. Such characterizations are unfortunate and untrue."

Such a mild statement from such a source, in view of the testimony now being given by government experts on the witness stand looks as though the writers had been derelict in their duty of through lack of energy (or something else) had failed to probe to the bottom of the matter. The wildest claims of the "yellow" journals have been more than substantiated, during the past week by the government's investigations at Chicago. Nothing yet published by private investigators can add color to the sworn statements of these experts or the shame-faced admissions of the men now under investigation.

It appears that copper is used to color green pickles, peas, beans and other vegetables; butter preserved with boric acid; milk with formaldehyde; jams and jellies with salicylic or benzoic acid; meats, oysters, etc., by borax, boric acid, sulphites or formal dehyde; and so we might continue to list them until columns are filled, but wherein the profit. The farmer may have pure water, if he stays at home; in the cities it must of necessity be less pure. If one turns to light drinks he is again confronted with what our best chemists have characterized as "deadly poisons." Should we wish something 'with a stick in it" a government bulletin says:

> "Beer is frequently preserved chemically. In the case of whisky and brandy artificial products are often sold under labels which represent them to be natural products. So-called essences are made on the manufacturing scale and sold commercially for the preparation of beverages intended to represent the various classes of distilled liquors. To these products a small amount of soap is sometimes added to produce a 'bead.' "

'Whither shall we turn," but to the farm, if we would preserve life and health. Rural life may have its drawbacks, the few may be consigned to unremitting toil, but to the intelligent farmer who studies his own and city conditions, the contrast in favor of of country life must be so strong that it will seem "one glorious morning with the sun ever climbing higher and higher; one blessed spring time, and yet richer summer—every plant in full flower, but every flower the bud of a lovlier."

* * *

A Valuable Gift.—California has, by the terms of the will of the late M. Theo. Kearney, received a gift of rare value and usefulness in the shape of 5000 acres of fertile and highly improved lands a few miles from Fresno, valued at three-quarters of a million. Though slightly encumbered it is stated by those best posted that after paying off the indebtedness the property would represent a clear gift to the State University of about half a million dollars.

In his will Mr. Kearney expressed the wish that the lands and property might be used as a viticultural experiment station for the use of the College of Agriculture and no doubt his wishes in the matter will be fully respected. Within the property is a beautiful park of 24 acres, splendidly designed and planted, together with many buildings suitable for the uses to which the land and appurtenances will be put. The vineyard is the largest in the state and has been a most profitable one, and altogether the property might well be termed a "princely domain."

While we fully appreciate the gift and its value to the viticultural interests of our state, we cannot but feel that a portion of it in the interests of justice and a "square deal" might have been so disposed that it could have reverted to those who had a moral, if not a legal right to claim it as their own. Many years ago more than a thousand acres of this vast estate were sold to settlers, under contracts to plant vineyards and make other improvements. Hundreds of acres were planted, homes were built, grounds laid out and embellished, and a prosperous community established, for the vineyards had begun to fruit, the colony was happy and newcomers were being attracted by the beautiful, well-ordered appearance of the settlement.

Then came the dark days of '93, finding the lands not entirely paid for. Mr. Kearney had in the contracts a 12 per cent compound interest penalty for all settlers who defaulted. He enforced the forfeiture claims, took back the entire lands, with all the improvements and thrust the holders, with their families, out into the world to shift as best they might. Many of these, supposedly prosperous in the morning, found themselves at night but paupers. The cries of anguish that went up from these homeless people would have haunted any man not entirely devoid of humanity until the day of his death and have moved him, in his will, to make some attempt at restitution.

Theo. Kearney was known as "the man of mystery," one "who was a friend to no man and to whom no man was a friend." So far as we know, no one ever sat at table with him, he never entertained anyone, either at home or abroad; he had no close acquaintance or confidant and his austerity of manner and bluntness of speech kept all persons at a distance. He labored hard in the interests of the vineyardists of Fresno and vicinity, but was, of all, most heavily interested financially. He died, as he had lived, alone and friendless, and except for his request that the gift to the state be known as the Kearney Experiment Station, would doubtless be soon forgotten.

* * *

The Farmers' Institutes.—The year which closed June first was one of unusual interest and value to all interested in Institute work in California. Each succeeding year notes a fuller appreciation on the part of the farmers of what is being done to uplift and dignify agricultural pursuits. So much of scientific application has been brought to bear on farm life in this State, that it requires no stretch of the imagination to realize that of all sciences agriculture is the deepest, most interesting, fraught with greater possibilities, more certain in reasonable compensation for time and labor employed.

In the central portion of California the reports of Institute work are most gratifying. More applications for Institutes, more attendance, discussion and interest evoked than in any former year of the work. By far the greater number of these meetings were in charge of Prof. W. T. Clark, who has also found time to make several lecture trips to the southern part of the State. It seems to be generally conceded on the Los Angeles Circuit, that next to Prof. Wickson, Prof. Clark is the ablest "all round" lecturer the University has.

In the southern end of the State we have more definite data. Mr. Neff, the conductor of these Institutes, gives us the following interesting note: "From December 10th, 1905 to May 17th, 1906, there have been held 101 sessions of Farmers' Institutes on 38 days and in 24 towns. The total attendance has been 5961." These figures show a most satisfactory attendance and we trust that notes will be made, during the coming year for comparison a year hence, that we may know for a certainty that interest in the work is growing. The above note is a true index to the business habits of the gentleman who has had charge of the Institutes in the south during the past year. Everything was carried out promptly and precisely, along the best lines, in a way that has appealed to all our farmers with large interests, for several of these have told us of letters written to the University authorities in commendation of the business-like methods pursued by Mr. Neff. He has succeeded in getting our "biggest" men spurred up to greater interest and activity than they have evinced in this work for some years past.

More speakers have been carried during the past year than before and the subjects were more diversified and practical, all political and other questions pertaining to extraneous matters have fortunately been avoided. Care must be taken to choose only those subjects nearest and dearest to the average rural community or we shall speedily have dissolution. The meetings of the past year have been unanimously voted as unusually valuable. What we want now is a united effort to impress upon the next Legislature the importance and value of this great educational campaign, so that the appropriation for Institute work for the next two years will be adequate for our needs.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Sultana shipped first cots May 25.

Gilroy's cherries go to Los Angeles.

Fresnoites are sulphuring Muscats.

Livermore has a new vine disease.

Redlands shipped first Valencias this week.

Marysville canneries are very short of help.

Canning cherries were not hurt by the rains.

Corona shipped 28 cars of citrus last week.

Colton is making a specialty of orange cider.

Escondido has shipped 50 cars of lemons to date.

The State will put up a $7000 laboratory at Whittier.

Petaluma reports cherries very slightly damaged.

Newcastle shipped Alexander peaches east last week.

Fresno growers are offered 8 cents for dried peaches.

Santa Cruz reports heavy loss in cherries and berries.

Cloverland, Washington, reports a splendid apple crop.

Blenheim cots are going from Dinuba to Los Angeles.

Redlands has heavy calls for St. Michaels and Sweets.

Corona has sent out 750 cars of citrus fruits to date.

Sebastopol Royal Anne cherries will bring 6 cents this year.

Only one-tenth of the hay about Marysville has been cut.

Three thousand cars of citrus went from Redlands this season.

The new Riverside experimental station will occupy 23 acres.

Laytonville reports damage to gardens by last week's frost.

Alta prune growers have received offers on a 2 1-2 cent basis.

The pear growers of the Sacramento river region have organized.

Mildew last year reduced the Fresno raisin crop 15 to 20 per cent.

The destruction of canneries in 'Frisco will overtax those outside.

A 35-acre plot is being planted at Hanford to Eucalyptus tereticornis.

Redlands has shipped 600 cars less of citrus than last year at same date.

A Hanford vineyardist says his raisins were damaged 20 per cent by the rains.

A big harvest of wild blackberries is being harvested along the Kings river.

It is estimated that the late rain caused a loss to the cherry crop of $250,000.

Monrovia ranchers were saved thousands of dollars in irrigation by the late rains.

Around Oroville the rains pounded immense quantities of cherries from the trees.

J. H. Reed, tree warden of Riverside, is rapidly covering all streets with trees.

A 4-acre strawberry patch at Hanford will this season yield a gross income of $1,000.

A Boise gardener expects to harvest 350 boxes of strawberries off a patch 30 feet square.

Sacramento county has appointed a special pear blight inspector to continue the work.

A Los Angeles man paid $10,000 cash for the cot crop on the Wilson ranch at Toluca.

Railroad traffic is so impaired that fruit shipments in some sections are in serious danger.

Hugo De Vries, the noted Dutch botanist is here to make a study of California native plants.

All the moveable plants at the Santa Ana U. S. plant station will be sent to the Chico Station.

The Royal Anne cherries in all parts of the State were not ripe enough to be rain damaged.

The Southern California shipments have amounted to 19,000 cars of oranges and 25,00 cars of lemons.

Santa Ana Valley Walnut Growers' Association has purchased a new model machine for drying walnuts.

Reports from Northern California indicate that there will be about seven thousand cars of deciduous fruit sent forward.

Navels are practically cleaned out in Riverside, and seedlings have the call now, going out with St. Michaels and a few Bloods.

AGRICULTURE.

Las Posas has had 21.42 of rain.

Eastern grain sacks are arriving.

Escondido expects a fine raisin crop.

Oxnard beets promise tremendously.

Beans have suffered from too much rain.

Fresno vineyardists say "too much rain."

Hops at Santa Rosa are bringing 12 cents.

Chino beets were helped by late rains.

Fredalba has had 57.76 inches of rain to date.

Hollister reports light rain and no damage.

Kern county reports "fine alfalfa this year."

Farmers in all parts are crying for grain sacks.

Santa Cruz has had enough rain—31.16 inches.

Coachella valley will ship 360 cars of cantaloupes.

The beet campaign at Chino opens about July 15.

Dinuba has had 5 inches more rain than last season.

The rainfall around Magalia totals 93.33 up to date.

The new "beet town" of Hamilton is having a boom.

The asparagus crop about Coachella will be a "buster."

600,000 acres of grain are growing around Escondido.

All San Quentin grain sacks are contracted to Sept. 1.

Vineyardists and orchardists rejoice when late rains fall.

Imperial farmers cannot procure enough harvest help.

Corn growers all over the State report a splendid outlook.

Several cars of beans were shipped from Saticoy last week.

High winds have slightly damaged melons around Thermal.

Highland reports 24 inches of rain as against 22 last season.

Exeter cantaloupes were greatly benefitted by heavy rains.

Too much rain is causing mildew in some vineyard sections.

In Fresno county hundreds of tons of hay were "on the float."

Many Visalia farms have been under water three times sin Jan. 1.

Desert grown asparagus sells at 75 cents per pound in New York.

Woodland reports very little damage to grain from the last storm.

Napa has had 55 inches of rain, two inches above last year's supply.

Late sown beets are being replanted at Salinas. Too much rain.

Farmers all over Oregon were damaged by heavy rains last week.

Hay and grain was somewhat damaged by rain in all parts of the coast.

Ventura reports that much bean acreage will have to be replanted.

The State Grange will meet in Santa Rosa the first week in October.

The Hanford farmers want a canal from Tulare lake to the San Joaquin river.

All hop sections were greatly benefitted by the copious rains of last week.

At Visalia thousands of acres of hay and grain were practically destroyed by flood.

The farmers of Stanislaus county pay $13 an acre water tax a year upon their alfalfa fields.

Folsom farmers were badly scared by the heavy rains, but now say little damage was done.

Fresno reports incalculable damage to fruit and grain in that section by the recent heavy rains.

The unusually heavy rains were fortunately followed by good haymaking weather in all parts of the State.

A dispatch from Salinas says that 15,000 acres of sugar beets will have to be replanted because of heavy rains.

The Pomona Farmers' Club with members from many others will hold their annual meeting at the Curtis ranch, near San Dimas Canyon, June 11.

Nearly 1000 acres about Northam, Orange county, have been purchased by a club of 130 families and have been subdivided into small acreage tracts.

LIVE STOCK.

Chino has a new creamery.

Santa Rosa is building a new creamery.

Redding wool is selling from 19 to 23 cents.

Cloverdale reports a light spring wool clip.

Healdsburg is to have a poultry association.

Salinas bee keepers need all the rain they will get.

Rains have been bad for bee keepers in all sections.

Bee keepers will get a good late crop of honey.

Stockmen in all parts are jubilant over the rains.

Escondido is getting to be an important poultry center.

Mendocino stockmen are smiling over promise of late grazing.

Folsom dairymen are preparing for the annual drive to the mountain ranges.

Farmers around Sheridan say the recent rains killed lots of young turkeys.

The elk which were taken to Giant Forest park last fall are doing exceedingly well.

About 15,000 bags of wool, valued at a million dollars will be handled at Stockton this year.

The San Luis Rey Creamery reports a supply of 987,881 pounds of milk for the year from 260 cows, from which $14,976.66 was received. This produces a gross income of $57.50 per cow.

FLOWER SHOWS.

The northern flower show usually held at this season was unfortunately "blocked out," or blotted out, by the appalling disaster which overtook our metropolis, but in the south the Los Angeles exhibition was extremely fine; perhaps no better display of cut flowers was ever seen in our State.

We sincerely hope that the coming autumn will see the San Francisco gardens luxuriating in bloom so that each end of the State will be able to hold their usual annual chrysanthemum show, which in the past have proved so alluring to many thousand of our flower fanciers. This semi-annual attendance on these exhibitions is in itself a liberal education in the wonderful floral productions of our glorious clime and all to whom it is possible should place themselves in the ranks of the recognized flower lovers.

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

FOR SALE—FINE LAND WITH WATER. close in to Turlock. Address Owner, Box 32, Turlock, Cal.

FOR SALE—A FEW THOUSAND BLUE Gums, cheap to close out, Address L. Z. Huntington, Anaheim, Cal.

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

REPRESENTATIVES WANTED IN every county to sell Parafelt Rings for Mason jars. The only absolutely sure and sanitary sealing ring made. Big money for hustlers. Write to T. S. Wilson, 1357 9th Ave., E. Oakland, Cal.

FOR SALE—OR EXCHANGE FOR TOWN or ranch near Los Angeles or north inland from coast, poultry and fruit ranch of 33 acres, shipping canning and drying fruits. All under cultivation and good improvements. Two hours' ride from San Francisco by cars, one mile from town. Address Box 64, Sonoma, Cal.

HEALTHFUL VEGETABLE COOKING oils, free from disease. Inexpensive. From corn, cotton and olives. Tiny samples 1c each. Also honey and olives. Address W. S. Ritchie Corona, Cal.

ARE YOU INTERESTED IN FRUIT CANNING? We have a book free describing six sizes of canners for the ranch or small factory, ranging from $10 to $125. Send postal with address for it. W. S. Ritchie, Corona, Cal.

ANTS You can keep them down and out with **KELLOGG'S ANT PASTE**, which is now considered the best exterminator in the known world. One bottle does the work, only 25c. If your dealer does not keep it send 40 cents to the Manufactory, 1010 E. Ninth Street, Los Angeles, and you will receive it prepaid by return express. Dealers wanted.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

SEPARATORS.

The old question which is the best separator, like that other tormentor of the Farmer's Institute speaker, as to which is the best breed of dairy cows, eternally rises to be answered. To both questions the same answer truthfully applies. There is no best, as much depends on the individual machine and the intelligence of the operators. As to separators, all I have ever owned required a degree of mechanical skill to operate them successfully; they are far from being automatic. I have owned and operated nine separators of four different makes or patents. All of these when operated according to directions as to speed and oiling did close skimming. At times I have to give the separator personal attention, as the men get it out of adjustment, but if promptly put in order the expenses are light. When the separator is not running in balance it loses the "tune or song" just as the automobile does when out of sorts, and it should be stopped and made right before it wrecks itself. The causes are usually so simple that they can be removed at once if the machine is understood. The standard separators operate on the same general principle, that of the centrifuge—the milk being heavier is literally swung by the rapid motion out from the lighter cream. Without there is some new principle lately applied these are the commercial separators of today. There are some cheap separators offered that claim a different plan, so several correspondents inform me; to them I would say these must demonstrate their ability to compete with the present style of separators in clean quick skimming before they will be accepted as a substitute. I have not seen these new machines, but one correspondent asks if the one advertised at $3.25 can be recommended, another writes they are offered at $15.00, and still another one at $50.00. The last one is simply a very small machine and for ten cows would take too much time, the other two are too cheap I fear, to be recommended. The matter of time reminds me of one of the stories told at the Berkeley Farmers' Institute last Christmas. One speaker at an Iowa meeting had recommended that the food for pigs should be cooked. Speaking of the increased ease of digestion, he said that cooked food was taken up in two hours, while the uncooked corn required at least four for assimilation. One old farmer got up and asked: "What does that matter, what is a hog's time worth anyway?" Now on many small farms the men feel that the wife and children can turn the separator, and what is their time worth anyway? The boys, however, as soon as they are old enough, step out for themselves to escape the belittlement of having their labor put upon the basis of pigs digestion.

The agents of a separator, for the sake of making a sale, will allow a week's trial of a separator; always accept this and be sure you have a good one before paying for it.

The present separator, the true separator, is the application of centrifugal force, in a machine driven at high speed to develop the force. One form of so-called separators are the dilution machines; these have served their time before the application of the centrifuge. They were an improvement on the open shallow pans as the milk was protected from exposure to contamination of dust and odors. They, like the pans, under favorable conditions of milk from fresh cows and right temperatures, would do close skimming. while under less favorable conditions the skim milk would show as high as 2.5 per cent of butter fat. The present form of separator can be run so as to leave only one-tenth of 1 per cent of butter fat in the milk without regard to temperature of the period of lactation of the cows.

While I do not recommend any make of separators as being better than another, it is only fair to say that I have used the following ones and they were all good: Danish-Weston, DeLaval, United States and Sharpless. These machines are correctly built, and if they fail to work well it is the fault of the individual machines and it should be exchanged for a perfect one. For this reason when you buy have an agreement in writing that if the machine does not skim clean that it will be replaced with a good one. I am like the little Irish Maggie that arrived in America and in five months lived in seven places. When her aunt taxed her with being changeable, saying, "Maggie, when you have been here longer and have more experience you will learn that you must be patient with people," Maggie replied with considerable dignity: "I have had my own experiences too since I came to America." Now I have had my experiences with separator men, and would caution you that anything the selling agent says the house behind him will not be bound for unless it is in writing. My experience cost me $200 and lots of vexation. I personally went to San Francisco and purchased a separator at a house where I had bought many hundred dollars worth of farming tools. The agent had not the size I wanted in stock, but had a larger one. I said I was afraid that the small four horsepower engine would not run it, but he assured me that it required only two horse-power, so I paid him the $200 down to secure all the discounts for cash. The engine could not run it, nothing short of the twelve horsepower engine used for pumping would run it. I never obtained either my money or a smaller separator and finally sold it cheap. All because I accepted an agent's word that the house refused to make good. Well, that house went down in the San Francisco fire, so peace be to its ashes, and may its business methods never again be resurrected.

* * *

Editor Cultivator: As an interested reader of your stock department I desire to ask you a question. Can you recommend a feed cutter that can be used for cutting alfalfa, oat hay, etc., for cow feed and that will also cut feed fine enough for chickens? Also the name of a dealer who handles a feed cutter of this nature.—J. J. C., San Diego.

Any of the small hand cutters should do this all right. If a power cutter is desired I can say that either the Ross or Belle City will cut from a quarter of an inch up to two inches. As to where you can buy them I can not at present give you addresses as living in the central part of the State, San Francisco has been our purchasing point. The dairy supply houses of Los Angeles surely carry full lines of these cutters, so ask your local hardware man for their catalogues.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

* * *

Taking a Test. (E. W., West Park.) The simplest way to test cows is to take a three days' test once a month, one day's' milk does not often give a good average. Take the sample three consecutive days, preserving the milk by adding a corrosive sublimate tablet. These can be purchased at any drug store. I personally prefer to use bichromate of potassium, as it shows in the milk and prevents danger of accidental poisoning. The three days' sample is fairer to the cow. The milk is measured by using a uniform amount each time a sample is added. For this purpose I have a small tumbler holding half an ounce. When the composite sample is complete it then is three ounces, or half an ounce from each milking. The practice of daily weighing the milk is fine; it acts as a check on feeding and on care of the cow, and it also, with the three days' samples, gives an absolutely correct test. In Canada the dairymen form societies for testing take the three days' sample once a month. The government tests the milk for them, and then with the milk weighed each day, each cow is given a government record by the year. In one of these testing societies, the first year the cows averaged 2,341 pounds of milk testing 3.8 by the year. At once weeding began of the poorer cows and the second year the cows averaged 3,000 pounds of milk of 4 per cent fat. The government of Canada is paternal and our own is rapidly becoming so, recognizing that the country's prosperity depends on the way the people are fed.

Success is the desired object of all dairymen, but it seems to be the hardest to obtain. Cleanliness is the first secret of success. Create better conditions in the stable. Give the cow better air to breathe, better food to eat, good water to drink and cleaner conditions to live in.

The dairy cow and the hog make an excellent combination. Not only do they pay well, but they take little fertility from the farm.

MILK COOLER

See Our **"STAR"** Sanitary Copper Cooler and Aerator, complete with Seven-Gallon Tank,

ONLY $13.00

Will cool 45 gallons of milk per hour to within two degrees of temperature of water.

What You Gain In a few words, you gain this by using a Tubular: (1). One-quarter to one-half more cream, because Tubulars skim by centrifugal force, which is thousands of times stronger than the force of gravity that makes cream rise in pans. (2). One-half to twice as much for butter, because Tubulars remove dirt and bacteria, thus making gilt-edge butter possible. (3). Half the work saved, because you finish skimming five minutes after milking, feed warm skimmed milk at barn, and have only the can of cream to care for. Write today for catalog W-260. It tells all plainly.

FEEDING THE BROOD SOW.

The feed of the pregnant sows should be rich in protein, which is a bone, muscle and lean meat former. Oats, peas, mdidlings and barley should constitute most of the ration, leguminous pasture and dairy by-products are also very good. During the first two months no change need be made in her usual food and she can be left with the rest of the drove, but as her time for farrowing approaches she should have different treatment as stated above. As farrowing time approaches the feed should be more sloppy and limited in quantity. Any tendency to costiveness should be overcome by feeding bran, oil meal, roots or pasture. A constant supply of wood ashes and salt is especially needed at this time to satisfy the craving of such food which often makes sows eat their pigs.

The manner of preparing the food should depend upon circumstances, as if the grain is hard, small or expensive, it should be either ground or soaked, the latter being preferred for wheat: Shorts and meal will bring best returns when made into a thick slop and fed sweet. Grain should always be fed on a clean floor and not thrown into muddy lots as many of the farmers are in the habit of doing. A good ration for the sow is two parts corn, two parts barley, two parts shorts and one part oil meal. It is not necessary ordinarily grind until shortly before farrowing.

She should be fed at regular intervals twice a day, and I have found that if a little stock food is fed at this time, as directed she will keep healthy and in fine condition.

When comfortable shelter is provided and good winter pasture can be secured, fall pigs are usually as profitable as those farrowed in the spring and I would expect my sows to farrow two litters a year and raise an average of nine pigs to the litter. This would make 180 pigs per year for the ten sows. The sows should be bred the last of November and the first day of May, so that the pigs will come in March and August.—Exchange.

THE BALKY HORSE.

Nine times out of ten a balky horse is the result of a balky driver. Many high strung and nervous horses are completely ruined by bad management on the part of the one working them. If the attention of a balking horse can be diverted, half of the trouble is over, yet how few men will refrain from beating him at such times.

When a horse is inclined to be balky he should be put in charge of the best horseman about the place, and not driven by everyone on the farm.

If he is inclnied to stop say "whoa" sharply. Then he will not think he is stopping of his' own free will. Get down and walk about him lifting up one foot and then another, tapping them with a stone may answer in diverting his attention; pretend to fix his collar, perhaps his mane is under it and needs attention. There are many ways of diverting a horse's' attention to make him forget his bad habits, like pouring a little water in his ears or rubbing sand in his mouth. Then if you speak to the quiet horse along side of him they may start off together or they may not. In any event keep cool. One scheme may work this time and may never work on the same horse again. The only alternative is to be ingenious, patient, long-suffering and kind until you find some other fellow who wants to take a hand at driving a balky horse.—The Farmer.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

TO BREAK A STABLE KICKER.

The best means is to give him a sand bag to exercise on. Fill a grain sack half full of sand so the sack will hang just where the heels of the horse will have good play upon it. Tie the horse in the stall with a good strong rope and let him kick. At the first kick the bag will swing away and return giving the horse as good as he sent. For the next few minutes there will be a lively mix-up between the horse and the sack, but the sack will hold its own, returning all it receives with interest. The horse in bucking against the real thing, will soon come to a realization of the fact, and will be thoroughly cowed. Leave the sack behind him for a week or so and then remove it. If he ever shows a tendency to get into his old habit of kicking, give him another punch bag to exercise with.—Epitomist.

FEED FOR MARE AND FOAL.

A correspondent residing in Ohio desires to know how he shall feed a racing bred mare that is suckling a foal. He states that he has corn bran, middlings and oil meal on hand and the best timothy hay, but will have clover pasture in one season. He also wants to know what will be the best ration for the mare when the colt is weaned and for the youngster after separation from its mammy. Dismissing the hay first, we should advise giving the mare about 12 lbs. of hay each day if she weighs 1000 lbs. and in that proportion if she weighs more. Of the grain she should have about all she will clean up, and seem a bit hungry still after getting through. A small part of the hay should be run through a cutting box into half or three-quarter-inch lengths and mixed with the grain ration. Preferably, we would have the oats ground and the corn also, though only a little of the latter should be used. Ground oats and bran, three-fifths and two-fifths bran by weight, mixed with cut hay, enough when dampened with water to fill a common stable bucket, we should consider the ideal ration for this mare. A handful of the oil meal may be added with advantage. Middlings we do not like as horse feed. It is apt to form a pasty mass in the small stomach of the horse. One part of the three parts of oats (by weight) may be replaced by ground corn occasionally by way of variety, and the food may be given dry once a day, if the mare likes it that way, for the same reason. We can give no absolute rule of thumb to follow as to quantity of grain to use, but a good rule is to allow one pound of grain per day for every hundred weight the mare shows on the scales. Watch her carefully and give her more or less according to her needs. The foal also should have all the grain she will clean up. Sieve the husks out of some ground oats add a trifle of bran at first and let him nibble at it at will. He will soon learn to like it. Fix a creep for him through which he may enter, but which will turn back his mother. Feed her three times a day, or only twice a day if more convenient, but let him have the chance to eat whenever he wants to. As he grows older increase the bran somewhat, and add a little oil meal (pea size) and let him have always all he will eat. Clover pasture we do not like for mares and foals. We prefer sound, old blue grass or mixed grazing and a shed should always be provided for shelter from the heat and flies in the dog days.

RAISE A GOOD ANIMAL.

It doesn't cost much, if any more, to raise a good animal, than it does to raise a poor one; all will admit that. Now at any time the good animal will bring more money than the poor one and at a time like this, when stock cattle are a drug in the market, the difference is great. We had an object lesson in this, last week, at a stock sale that we attended. Readers will remember our speaking of a sale two weeks ago where cows sold for around $17. At the sale we were at the other day the stock had been bred up by using a pure-bred bull for the last seven years. This was all the extra expense that this man had been to, over the other, yet these cattle sold, at public sale, for an average of $6 per head more than the others. One used an animal to head his herd that cost $100 while the other had never paid over $25. The first man didn't have to sell many head to pay the extra cost, did he? And he has the satisfaction of seeing nice looking cattle around him, which is worth something to any man. Now don't think that we are harping too long on this subject, when it is one we have all got to face, sooner or later. Less cattle and better ones, is what we have got to come to, and the sooner the better for us.—Farmer.

ANSWERS TO CORRESPONDENTS

(All questions on live stock and dairy matters are referred to Mrs. Sherman for answer. It often occurs that "Anxious Enquirer" needs an immediate answer. To pass this correspondence through the Cultivator and wait until the next issue is printed will often entail a monetary loss upon our subscribers. Desiring to be of as much service to our patrons as possible Mrs. Sherman has kindly consented to answer all enquiries direct, if a stamped and self addressed envelope is enclosed with the letter of enquiry. We trust, and believe, that such an arrangement will be of great benefit to our readers. Address Mrs. Minna E. Sherman, Minnewawa Ranch, Fresno, Cal.)

TO KEEP OFF FLIES.

Editor Culitvator:—Can you give me a remedy for keeping flies off of cattle?—D. F. C., Los Angeles.

Lysol two ounces, oil of tar four ounces, creolin two ounces, cotton seed oil one gallon, make an emulsion by pumping in back a couple of times. Use a spray gun to apply. Use full strength on calves except around the eyes. Creolin two ounces, oil of tar four ounces, warm water one gallon, is also effective for cows and will not make them sticky like the oil. The first remedy is good for ticks and lice on cattle and should be applied to the under parts where these congregate.

MILK AND LUMPY JAW.

Editor Cultivator:—Will you kindly tell me if the milk from a cow that has recently had the lumpy jaw is all right for family use. Is there any danger of tuberculosis? She is a Jersey, two years old and has good appetite and in fair flesh.—S. R., Anaheim.

If the cow is cured of lumpy jaw, and has no other disease ceratinly her milk is wholesome as far as the disease is concerned. Tuberculosis is a different disease and your cow can be tested by a veterinary with tuberculine. This is never amiss, we began to test our cows some years ago and think it pays well as a financial proposition and then we are sure no one drinking milk at our table can be infected.

GUERNSEYS WANTED.

Editor Cultivator:—Can you give me the address of any breeder of Guernsey cattle on this coast?—D. S. J., Redlands.

I am sorry I cannot give you any addresses of coast breeders of Guernseys. The Guernsey Breeders Sale List Bulletin I have before me but I find none for this coast listed. I should like to see some of this breed here for it is a noble race of dairy animals. I have sent your name and also that of another correspondent to Wm. H. Caldwell, Secretary of the American Guernsey Cattle Club, asking him to take the matter up with you. The official postoffice address is Peterboro, N. H., where you can also write for further information.

ANGORA GOATS.

Editor Cultivator:—I have some wild land covered with sage and bunch grass, etc., quite broken, not worth anything for general farming but lots of good feed. Riverside County near Redlands. Am thinking of stocking it with goats. Elevation 2500 feet, plenty of water, no trees. What kind of goats would you advise buying, and where and of whom can I get them at the best advantage.—O. S. D., San Bernardino.

An advertisement in a paper would probably bring an answer. It is generally conceded that Angora goats are profitable, they certainly clean up brush land in short time. As they roam and destroy more feed than they consume, it is usually considered wise either to herd or to fence the land into different enclosures. The hair sells for more per pound than wool though there is much less of it. The hides make mats, while the meat from the kids is delicious. You remember it was a kid-dressed savory that cost Esau his father's blessing. I have seen Angoras feeding in the foothills and have tried to buy a few, but have never been able to do so, as the Basque herders had no authority to sell and the owners were far away.

For Wooden Sole Boots and Shoes see O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

FEEDING GREEN CANE.

Editor Cultivator:—What would be the result of feeding green sugar cane and barley hay chopped together?—S., Compton.

Try it and let us hear results. It will not be a balanced ration as it will lack protein. If for milk cows a little alfalfa hay or pea-vines or oat hay would improve it, or if too bulky a little bran should be added, if the cows will pay for it.

CORN CULTURE.

Editor Cultivator:—I notice that your stock and dairy writer has used Egyptian corn as a dairy ration. I should like to inquire how to handle it. We have raised a great deal and have never found an economical way to get it in right shape into the feed trough. We have used the corn harvester, then it is hard to thresh and expensive. We have headed, then we have expense of threshing and grinding. I have searched everywhere for a machine to take the place of the corn and cob mill back east so that the Egyptian corn heads and possibiy the barley heads could be run through the grinder. Have just ordered samples to be sent east to test the cob mill. You will readily see what a saving this would be. I shall be thankful for any consideration you may give this inquiry.—J. M. H., Los Angeles.

We chop the head into inch pieces with an ordinary hay cutter, five or more tons at a time, storing it in a bin near the cow barn. At feeding time ten pounds to the cow is spread on the floor of the large mixing box, (12 by 12 feet and 2 feet deep), about two inches deep usually, the chopped corn heads are then sprinkled with water, on top the rest of the grain is spread and this is also wetted down. The morning feed is prepared the evening before and the evening feed at morning feed time. Just before feeding the mass is mixed thoroughly with a hoe and then divided according to amounts fed to each cow. I believe the machinery to grind it will be an improvement. Lately we have bought the thrashed corn, the reason being that having abundant water Indian corn pays better to grow and then silo, while as a catch crop sorghum is preferred. The Egyptian corn roots are expensive to clear off the land, they will not burn for a year or more. We do not like to have a mass of vegetable matter stacked up for fear of starting a bed of mildew or fungi to infect the grape vines.

Many a so called dairy cow is eating a dollar's worth of feed for every fifty cents worth of milk and cream she is producing. The cow that will not give 3000 pounds of milk yearly testing at least three per cent butter-fat, is eating the farmer into debt.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

THE EFFECTS OF WEATHER ON POULTRY.

Easterners complain that we in California sell climate when we sell them land. I will not dispute the matter for we usually have such a lovely climate that it would tempt any one to buy a bit of land to live on and enjoy the delightful balmy air.

When I was in Oklahoma I made some remarks about the climate, "we don't have climate here!" was the rather startling reply, "we have weather!"

I think that we may decide that this spring we are having or have had "weather" instead of "climate," and that we might be willing to sell some of it if we could have our usual pleasant climate.

"My hatches have been very poor this spring," writes one. "I have only had eight or ten hatch out of a hundred, and I am dreadfully disappointed," is the sad cry from another. "The poorest hatches I have ever had!" reports another.

It has been the big conundrum propounded to me this spring, and I think a good deal of the blame has been laid on the weather, which has been unusually damp and chilly and perhaps the weather has had something to do with it, but we should adapt ourselves to the weather if possible. We should be so thoroughly acquainted with the appearance of the eggs during incubation that if they are not drying out sufficiently (we can tell that by the air cell in the eggs not being large enough) we may remedy it by airing the eggs more, or ventilating the incubator or the incubator room more.

When I visited Mr. Culver's broiler plant and saw his big eight-thousand-incubator he told me that he was having excellent hatches, but that many of his neighbors were having the poorest hatches they had ever had. I immediately asked him about his hydrometer and the moisture problem, and I learned that he had to keep the atmosphere more dry this year inside his incubator than last.

He thought it was on account of the greater humidity in the air, and it may be partly this; at any rate there have been poorer hatches than usual this spring and therefore quite a number of us will want to hatch later than usual to recoup ourselves if possible.

I have hatched every month in the year in California, so I know it can be done, but summer chickens need summer care, and here again let us consult nature.

Nature only hatches her wild birds in the spring or early summer, and if we want to succeed with our late hatches we must as far as possible give the hens and the chicks the same conditions as nature gives in the spring time.

I have already talked about the

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A Filcher, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

San Francisco Office and Salesroom, 33 Market St.

green feed and animal food which should be abundant, not only to make the eggs strongly fertile, but to make the chicks grow properly and to give them the large, sturdy frame which we all want in our fowls.

We must remember that in using the eggs for hatching so late as June, July or August, the hens have been laying for a long time; it is nearing resting time, the moult, and their vitality is lower than usual in spring, therefore give extra care to the hens whose eggs you need for hatching. Feed them liberally, especially with green food, have the nests in cool, shady places, and gather the eggs frequently during the day, keeping them in a cool cellar, until you set them.

It you set them under a hen be sure that the nest is in a cool place, either in a house which is shaded by a tree, or in a nest or barrel well shaded, on which the sun never shines. I found, some years ago, that one of my houses was quite warm. I took out a thermometer, put it in the hennery, and was horrified to find the temperature 112°. The hens were standing up over the eggs, and I had a fair hatch, but some cripples, especially among the ducks.

If you try an incubator keep constant daily watch over the air cell in the eggs, and guide the ventilator accordingly.

And when the chicks hatch give them shade even more than sunshine, plenty of cool, fresh water, and crisp green food.

Few realize how necessary shade is to fowls in this climate. The best of shade is under a green bush or tree, or plant of some kind. I have some French artichokes and the chicks delight to bathe or dust themselves or take a siesta under those luxuriant leaves. The underside of a leaf is always cool even on a hot day, and the shade under an umbrageous tree is several degrees cooler than that under a dry board. Fig trees give a grateful shade, and there is nothing easier to grow from a cutting of a neighbor's fig tree. Get a bit of the branch 12 inches long from a bearing tree, bury it, leaving only one inch, not more, above ground, water it, and in two years you will have figs to eat and shade for your chicks. I stuck in slips of figs everywhere I could and I found that those taken from a bearing tree bore fruit sooner than suckers which spring from the roots.

The chicken yards should have plenty of fruit trees to shade the chicks. I had peaches, plums of many varieties, pears, figs, walnuts, all were loaded with fruit. The chickens eat the fruit that falls and the hens sometimes fly up and eat from the trees and I never found it to injure them in the least. Perhaps if they had not been accustomed to green feed always, the first fruit might be a little trying, as green apples are to our boys, but usually there is not enough to hurt them, and they soon adapt themselves to the conditions.

Shade is a necessity and if you have no trees you can drive a few stakes or small posts into the ground and make a rough little frame on which to lay branches, rushes or even weeds. Or if you are using cat proof pens and have not even weeds lay a few gunny sacks on the top and on the western side. I made a handy little shade by opening a gunny sack and tacking four laths on the edges; this I would hang on the fence or lay over a coop and so give shade out on the alfalfa patch. If you make up your mind that shade is necessary you can find a way of getting it.

Cool water, clean and pure, is one of the hardest things to provide in summer. There are nice little drinking fountains to be had at all the poultry supply houses. These can be placed either under a tree or be sheltered from the sun in a box set on end. Or if you are far from town you can make a good little fountain out of a tomato can by either cutitng a V shaped nick in the edge, or by making a nail hole in it half an inch from the edge, then fill the can up to the hole with water, put a saucer over it and quickly invert it; the water will leak through the nail hole as fast as the chicks drink it.

Another way of making a drinking fountain is with a bottle. Take a bit of stiff wire, a hair pin will answer fairly well, put it into the mouth of the bottle bent in such a way as to keep the mouth of the bottle half an inch from the bottom of the saucer, when it is inverted. You can lean the bottle against the wall, fastening a wire to the wall the size of the bottle so you can easily slip the bottle out to clean and fill it. Or you can fix the wire in a box, arranging it so the bottle will stand on end in the saucer and be in the shade, or you can make a small square frame to hold the bottle in place. The most important part is the bent hair pin which keeps the mouth of the bottle from touching the saucer. The top of a Mason fruit jar makes a good sauce for very little chicks.

Shade, water and an abundance of green food are summer necessities.

* * *

VERTIGO.

Mrs. Benedickt, on my farm here, has several goslings, about two weeks old, which are dying from a peculiar trouble. They appear suddenly to become dizzy, stagger around like a drunken man, fall over, get up and fall over again. When they start to go to a dish or any object, they act for all the world like a drunken man. Their heads are not swollen nor are their crops hard. In about 24 hours they get past walking and die. I thought at first they had been overfed or fed on indigestible feed, but Mrs. B. tells me they have only crumbs and grass. The peculiar disease makes it of interest. We may not have it in California. I have thought you might be interested in the strange phenomenon.—J. J. S., Dunlap, Iowa.

Your friend's goslings are suffering from vertigo, very like "blind staggers" as you say.

Vertigo in both geese and ducks is usually caused by lack of shade. Shade is an absolute essential in the successful raising of these water fowl. Bathing the head in cold water and giving a small dose of hyposulphate of soda, or five grains of bromide of potassium, or a little Epsom salts (about twenty grains) in water, and keep them out of the sun for a few days then give them a shady place. Another cause for "staggers" is lack of grit; give coarse sand with each feed and leave a box of sand where they can always eat it. Little goslings should not be allowed to swim in water until they are four or five weeks old, eight weeks old was, I think my rule. You see I have tried my hand at goose raising in a limited way.

The American hen, pluming herself on the eulogy recently delivered upon her usefulness by a Congressman, has now entered the lists as a trust buster. Fourteen million two hundred thousand eggs were recently shipped into Chicago in one day, and the beef trust is said to be taking notice.

THE CHICKEN MITE.

The chicken mite (Dermanyssus gallinae) is generally distributed throughout the world wherever chickens are raised. The adult is of a light-gray color with dark spots showing through the integument and is about 1 millimeter (less than 0.04 inch long. When filled with blood the color of the mite is decidedy red.

The usual habit of the mite is to attack fowls at night and to hide in cracks and corners or under rubbish by day. In exceptionally bad cases of infestation mites remain on the fowls during the daytime. Often, however, an examination of fowls during the day will fail to reveal the presence of any mites, although the same fowls are badly infested at night. The presence of filth, such as droppings, rotten eggs, or other rubbish, is favorable to their multiplication, as is also a careless construction of buildings, which furnish hiding places for the mites. This mite attacks all kinds of farm poultry including pigeons, and also wild birds which nest about barns, especially swallows. Occasionally it infests man, horses, and other animals, producing symptoms of scabies by its bites. Young chickens and sitting hens are most seriously infested by this pest. At the Mississippi Experiment Station the mites were observed "so numerous that they actually hung in festoons to the sides of the nest-boxes." At this station and also in Iowa the chicken mite is considered one of the most formidable difficulties in chicken raising. At the Iowa Station sitting hens were occasionally killed outright by the mites.

Several remedies have been suggested for the control of the pest. The Division of Entomology of the Department recommends the destruction of the nests of swallows and pigeons about poultry houses, the removal of rubbish, provision of a dust bath for the fowls, and spraying the house and roosts with kerosene, kerosene emulsion, benzine, gasoline, or whitewash, or dusting with carbolated lime. Dr. D. E. Salmon recommends dipping infested fowls in a 1 per cent solution of carbolic acid for 1 minute, or in a solution of creolin, using this substance at the rate of 2½ ounces per gallon of water. The same author suggests the addition of pyrethrum or sulphur to the dust bath, application of carbolated lime as a wash, fumigation of the henhouses with sulphur, and the direct application of pyrethrum to infested fowls. The Virginia Station recommends spraying the infested houses with a 2 per cent solution of crude carbolic acid at intervals of two weeks.

Recent experiments at the Iowa and Mississippi stations in combating the chicken mite have shown that cleanliness is of prime importance, that all filth must be removed and all cracks exposed if any treatment is to be effective. Nests and roosts should be of simple construction and removable in order to facilitate thorough disinfection. Poultry houses should be constructed so as to furnish no hiding places for the mites. At the Mississippi Station henhouses were kept free from mites by thoroughly dusting with lime and sulphur at intervals of two weeks, treating the nests with crude petroleum, and placing moth balls in nests, but not in contact with the eggs. At the Iowa Station Dr. Repp had the best results from the use of kerosene emulsions made of ⅛ pound hard soap, 2 gallons kerosene, and 1 gallon water, the mixture being diluted with 10 volumes of soft water before using. All parts of poultry houses must be thoroughly moistened, particular attention being given to cracks, holes, joints and other hiding places. This application should be made three times in rapid succession on the same day. Some of the eggs of the mites escape this treatment and the application should therefore be repeated at intervals of about three days for a period of two weeks.

With this system of disinfection it is usually unnecessary to treat the hens directly, since the mites leave them during the day and are killed by the application of kerosene emulsion. The extermination of the mites may be hastened, however, by dusting the hens with pyrethrum powder after they have gone to roost on the evening before the insecticide treatment is applied. A good spray pump should be used in applying the kerosene emulsion, so that the material may be thrown into all cracks and corners. According to the experience of the Iowa Station the method is an inexpensive one. The material necessary for spraying ordinary farm henhouses costs about 45 cents.

THE AMERICAN HEN.

The American hen made a record in May. In one day last month there were received in New York over 40,000 cases containing 15,125,000 eggs. This was almost four eggs each day for every man, woman and child in Greater New York or more than three times the avreage daily consumption. The value of these eggs was $250,000.

The praise of the American hen and the recognition of her work have gone beyond the annual statistics of the secretary of agriculture. He reports that last year the eggs of the United States were worth more than the cotton or the wheat, more than all the potatoes, the barley, the tobacco, the sugar cane and the rice. They almost equal the dairy product and are surpassed only by the corn crop, a good part of which is fed to hens.

The Congressional Record also includes a proper tribute to the industry and value of the American hen. Every three months she produces more wealth than the capital stock of all the banks in the New York Clearing House. In two months she lays more value than the annual production of all the gold mines in the United States. Her eggs for six months are worth more than the year's production of pig iron. In less than two years the American hen could pay off the debt of the United States.

THE POULTRY BUSINESS IN CALIFORNIA

The State Agricultural Society has made some investigation of the chicken industry as conducted in California, and finds that while failures occur, as in all lines of industry, they are less frequent than in most other callings. On the whole, the chicken business in this State is growing and prosperous, and the communities where it is obtaining a foothold find their business being converted from a credit to a cash basis. Less capital is required to begin with in proportion to income than in most other lines of industry, and the returns are surer. Floods or drouths or unseasonable frosts do not materially affect the output. The market is close at hand, the pay is always cash, and the prices are generally satisfactory. Big farmers in California have been disposed to regard it as a little business, but its profits have begun to attract big men and superior talent.

On the question of capital required to start a poultry farm large enough to comfortably support a family of say five persons (man, wife and three children), we have some figures from Colonel L. C. Byce, of Petaluma, who has been identified with the business in that great poultry center almost from its infancy, who has had great opportunities for a study of the industry, and who may be regarded as an authority.

Land required, from three to five acres, five preferable; cost, approximately $500. Character of land, sandy or gravelly soil preferred, next best sandy loam, adobe least desirable. Land should have natural drainage, and if the slope is toward the east so as to have the benefit of the early morning sun, so much the better. Cost of five-room cottage, $1,200 to $1,500, according to finish; barn suitable for horse and cow, $150; poultry houses, $20 per 100 fowls, or $240 for 1,200; a six-foot, two inch mesh wire fence, about 15 cents per running foot, for five acres $280; horse, $150; cow, $50; wagon, $100; well, pump, pipe, and household furniture, $250; poultry stock, $500; incidentals, $30.

These figures, which are based on the cost of buying all material and hiring all help, counting the house $1,250, aggregate $3,600. They mean good land, a good house, a good horse, good wagon, good cow, good stock, good fence and fairly good outbuildings. A family can start with a much cheaper house, with a poorer horse and poorer wagon, and other articles of less cost, and thus cut the total very materially; or by the man and his boy giving a hand in helping to build the house, the fences, the barn, and the chicken houses, the quality of the articles in the first estimate can be had at a very much less cash outlay.

On this place one acre can be devoted to family orchard, garden, stable yard, and house yard, and four acres to poultry. Colonel Byce says, "This will suffice to keep from 1,000 to 1,500 laying hens. Usually one can keep 300 to 400 laying hens to the acre of land. Of course, where it is desired to raise a number of small chicks calculation must be made for them. One half acre of ground is enough land on which to raise chicks to replace the old fowls." It must be borne in mind that the business requires diligent and intelligent care, and the more chickens one undertakes to maintain on any given sized piece of ground the more vigilance

$1500

For the above sum, Captain Mitchell of Santa Barbara will sell his poultry business and good will. The outfit consists of 1000 Standard Bred S. C. White Leghorn laying hens and pullets and their fixtures, i. e., Brooders, houses, Posts, 6 foot "Union Lock" Fence Wire, Etc., Etc.

Sales of eggs for hatching average 14,000 per year at $70 per 1000, and the net income per annum for the last four years has been from $1000 to $1500. For further particulars apply to

is required in keeping the place clean.

It is safe to estimate that the cost of feed will average $1 for each hen per year. The more green feed the garden produces the more this figure can be reduced.

"The profits," Colonel Byce says, "depend much on the man—the care, attention and intelligence he puts into the business." Some are making as high as $2.25 per hen per annum, but $1.50 per hen is a good average. Some, from lack of attention and careless habits, struggle to get along; others, more shiftless, fail entirely. In this it is like all other business. Most men, however, do well and many make money. On the whole, the business is profitable, and for the frugal and intelligent man with limited capital, affords a betetr income in California, along with a more agreeable occupation, than almost any other industry.

In this connection it may be mentioned that notwithstanding he improved methods adopted and other stimulus to the business in late years, the average price of eggs in the United States for 1904 and 1905, about 25 cents, is higher than since the war period, when the average jumped from 15 cents in 1862, to 20 cents in 1863, to 28 cents in 1864, and to 35 cents in 1865, the highest ever recorded. After that the price gradually lowered to an average for the period from 1870 to 1900 of about 20 cents per dozen. Since 1900 the prices have gradually and uniformly tended upward.

Respectfully,
J. A. FILCHER,
Secretary, State Agricultural Society.

WHAT KEPT THE TWINS QUIET?

It was something unusual, this period of prolonged quiet.

Mama Elliott had looked out of the window repeatedly and seen the dear little figures trudging contentedly side by side; had noted their many trips to the stone pile, and watched them anxiously as they crept through the bars and crossed the yard to the straw stack together.

"They are on an egg-hunting expedition, the dearies," she mused; "how delighted they will be if they find a new nest. I hope they will not break any of the eggs.'

But, no; another glance revealed the two busy little figures returning with tiny armfuls of straw—struggling through the bars, little Betty's palmetto hanging by its string down her back, and her curly hair full of straw bits and chaff, and Paul waiting patiently on the other side laden with straw also. Ponto stood by, wagging his tail leisurely, waiting, also.

Mama Elliott smiled tenderly at the pair through the window. "Playing livery barn again," she thought, "and filling the pony's manger. Well, I'll let them play a little while longer while I finish this work,' and she glanced at the clock.

Half an hour passed ,and a strange quietness seemed to settle over garden, yard and orchard. The twins had vanished, and no merry chatter or calls for "breddy butte," or "tookies," had interrupted the busy worker for another half hour.

"I must call them now, or send Mab to look after them," and stepping to the door she called: "Paul, Pau-l-l! Betty, Bett-e-ee! where are you, dearie? Answer mama."

But no answer came back, and no familiar little figure appeared in answer to her repeated calls.

"I wonder where Ponto is?" she queried; "surely no harm would come to them without his making a fuss," and snatching her sun-bonnet from the peg, she hurried out through the garden—out into the barnyard—past the pony's stable—still calling and looking anxiously into. all their favorite playhouses.

No Betty, no Paul, anywhere to be seen. Back again through the stackyard, garden and orchard, down by the duck pond hidden by the willows, still calling for Betty and Paul, wandered mama Elliott, with a sinking heart.

"I shall have to blow the horn for papa and the boys, if I do not find them soon,' she said to herself.

"I wonder where Ponto is? He certainly is with them; or was, the last time I saw them."

"Here Ponto, Ponto, Ponto!" she called. "Where are you, old fellow?"

"Good dog," she exclaimed, as she saw him appear at the old sheep-cote door; "where are the twinnies—where is Betty? Come here, good fellow."

For answer Ponto set deliberately down and swept the ground with his tail, and yes, mama Elliott thought he atcually smiled as he looked backward over his shoulders.

"In there, are they?" she said, as she stepped quickly forward, stopped short and smiled too.

Then she laughed outright, for there, seated demurely on two little boxes filled with straw and a few smooth stones for eggs, sat the twinnies, Paul and Betty, one on each side of Johanna, the old grey goose, who, with an eye on each twin, was calmly occupying the middle nest and tending to the business of keeping the ponderous goose eggs warm.

"Sssh! Sssh! ma!" said Betty, "you mustn't 'sturb her." "We's keeping Johanna comp'ny," added Paul; "and helping her hatch."—Farm Journal.

BONE MEAL—GREEN BONE

Green cut bone undoubtedly increases the egg production, and it also materially reduces the demand for grain, but bone meal, containing as it does but little water, ground so that it is about the size of a kernel of wheat, is always ground from dry bones and while it helps egg production some is not so digestible and is not to be compared with green cut bone. We feed both and use the bone meal mixed with the grit material, for the fowls will not overeat of it as they will of the green cut bone if given an opportunity. Of the latter we find it best to grind it fine, using fresh bones with a little meat clinging to them, and mix it with the grain food, using about one-eighth of the cut bone to seven-eights of the grain and feeding daily. Sometimes we find that some of the fowls are made a little sick eating it and the ration is then cut down; this is especially true when there is considerable meat ground with the bone. We use it in small quantities, scattered through the chaff on the scratching house floor, and when so used it takes the place of the grain which would otherwise have been used. Get a bone cutter and experiment carefully with the green cut bones, using them in increasing quantities until the results tell you to stop.

BOTH DANGEROUS.

There are two kinds of exposure to which chicks may be subjected and one is no less injurious to them than the other—exposure to the extreme heat of the sun and exposure to rain and stormy weather. It must be the object of the chick raiser to protect the young and tender birds, as well as those which are more advanced, by affording shade from the heat of the sun and shelter from wind and rain, and this can be done by both natural and artificial shelters. It is a good plan to have the rearing ground adjacent to a wood or bushes, which will shelter the birds from the prevailing winds, but in the use of suitable coops there is much that can also be done toward providing comfort. In any case the two elements of danger in the life of chicks are too hot sun and too cold winds.

Some seasons there is practically no profit in some of the branches of general farming, but poultry keeping, as a branch of farm work when properly managed will always be found to pay a good profit. It is a line of work that does not need to interfere much with the other farm work and still will bring some returns every month in the year. Those who have given it a fair trial have, with few exceptions, pronounced poultry keeping the most profitable of all the branches of farm work. It is destined to occupy a more and more prominent place in agriculture.

Blue Andalusian Eggs
$1.50 for 15, $6.00 per 100. Free range. I raised and sold cockerel winning first prize at late L. A. poultry show. Stock. **Mrs. J. S. Duff, 3145 S. Hoover St., Los Angeles, Cal.**

No Results No Pay
WE have spent a vast amount of money experimenting with Poultry Feeds—compounding, grinding and mixing different grains with seeds, alfalfa and meat in hundreds of combinations. Then feeding it and watching what happened.
The result of this time and money is
Purina Poultry Feeds
They will cause a hen to lay all the eggs she should, day after day, year after year, winter and summer, and will keep her healthy and vigorous every minute.
And they will do it every time—not just once in a while.
But don't take our word for it—try the Purina Feeds on your hens at our expense.
If the results don't come, just tie up the bag and write us and we'll return every penny of your money and tell you where to send the balance. You are not out a cent in making the trial, for we will deliver through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

General Agriculture

PLOWING TOO WET OR TOO DRY.

Sandy soils are usually not injured by handling when wet; but the case is different with clay soils. A fair quality of brick can be made from any heavy clay soil by working it thoroughly when wet and then drying it in the sun. The effect produced by working clay soils wet is known as puddling. Irrigation ditches in the West are puddled by first flooding them to make them muddy and then driving bands of sheep along in this mud. This makes the bottom impervious to water and prevents loss from leakage. If a clay soil is plowed, or even harrowed, when too wet, it is more or less puddled. In this condition it becomes cloddy and impervious to air and water. Old roadways that have been thoroughly puddled from traffic in all kinds of weather may be distinguished in fields many years after they have been plowed up and put into cultivation.

The proper time to plow land is when it is just moist enough to break up mellow, neither wet enough to leave a slick surface when rubbed by the moldboard nor dry enough to break up in large clods; or, as the southern farmer puts it, when the soil has a good season in it. If continued rain follows wet plowing, little harm follows; but hot, dry winds soon leave only a mass of unmanageable clods. In spring and midsummer plowing, particularly, it is of the utmost importance to run the harrow immediately after the plow. This prevents the formation of clods.

BUTTER AN OLD PRODUCT.

The word butter (butyrum) comes, according to Charles Toubin, from the Sanscrit but (to beat) and ura (milk). This precious substance consists in an agglomeration of the fatty globules extracted from the milk where they are in the state of emulsion through the churning operations. Cow butter is the only really good one. It is oily and rich, of a delicate and special odor, and of a pure, sweet and pleasant taste which reminds one of the nut tree. Butter, of which Paris uses more than one and a quarter million pounds worth annually, is an article of food the use of which goes back to the remotest antiquity. It is true that the Romans only used it as an external remedy unguentum, but the Hindoos and Jews were surefeited with it, and the savages of the north seem from all times to have made it the basis of their foods. The oldest Iceland poem relates how the bard Skidi dreamt one night that he asked in marriage Friggia, the goddess of Love, and that the god Odieu gave him as a wedding present a case full of butter.

The best butter is made in the provinces of Normandy and Brittany, but the mountains of the east also produce a white butter much appreciated by connoisseurs. Flanders, Holland, and England produce exquisite soft butter, because the agricultural population of these beautiful countries take great care not to feed their cows with anything which may give a bad taste in the milk. Furthermore, they possess in the highest degree that quality of cleanliness in every particular which is so indispensable to all farming industries of whatever kind.

The most delicate butter is made with fine cream which separates spontaneously from the standing milk. When the butter is beaten, all the buttermilk must then be removed—that is to say, the particles of whey and casein which cause it to go rancid and spoil the taste. The best way of doing this is to cut the butter into thing strips and kneading it for some time with rollers and beaters. May is the most favorable month for butter manufacture. Butter is a produce of the north, as the low temperature at which it melts makes its use difficult to the southern races, and their stomachs also have very little desire for fatty substances.

Butter becomes rancid very quickly, and bitter (strong butter) owing to the emission of butyric acid, produced by its putrid fermentation. Butter is preserved either by melting it in the water bath or by salting it with from one to two per cent of dry salt.

It is a very nourishing food and more easy to digest than animal fats, on account of the aromatic elements it contains. Emolient and laxative, it, on account of the quantity of carbon which it contains, assists the breathing functions, and is productive of animal heat. With bread and salt it supplies an incomparable hors d'aeuvre and is one of the most wholesome of foods

The fundamental support of cooking—a condiment of any number of dishes which it would be difficult to make without it—it gives to our foods a flavor and special digestibility. It facilitates the preparation of soups, meats, fish, vegetables, etc.; the fresher it is the better it is digested. It is the very best food for weak, debilitated and thin people, consumptive, diabetic, and nervous people, and those suffering from lung complaints.

SMOKE TO CALM BEES.

Beehives are now so constructed that they may be opened and their contents removed or changed about and examined without materially interfering with the actions of the bees. They frequently continue their labors even when the comb is held in the hand of the beekeeper.

One of the great improvement in modern beekeeping is the use of smoke to calm the bees, instead of killing them. In the up-to-date apairies a little instrument for puffing smoke is used for htis purpose.

A good smoker is indispensible to every beekeeper. See that it is in good order. When the fuel in it is well ignited, approach the hive and blow a few whiffs of smoke in at the entrance. Wait a minute, then blow a little more smoke until the bees set up a sort of roaring noise. Then gently commence to open the hive, and if the bees show a desire to come up, blow a little more smoke over the tops of the frames; this will drive the bees back.

Bees can be smoked too much, particularly when the queens are to be found. Just how much to give depends upon the disposition of the insects.—Exchange.

The California Compounding Co., 205 W. Taylor St., San Jose, handle exclusively the best parrafine oils, refined by the large independent oil refineries in Pennsylvania. Their business is not interrupted and they are able to fill all orders for their well-known spray without delay.

MIXING BRAINS.

"I never saw anything like the wonderful colors you get into your pictures," said the critic to a great painter. "How do you mix your paints?"

"With brains," said the artist.

Mix the ordinary with brains and you get the fine and the extraordinary; pig-iron becomes the steel-watch-spring; calves' feet are turned into the daintiest gelatine; and now we are told that the most remarkable roofing on the market today is obtained by treating long-fibre wool-felt by a similar mixing of brains.

J. A. & W. Bird & Company, of Boston, are responsible for this wonderful result.

Beginning with a foundation of highest quality wool-felt, they put it through a course of wool-mixing in which some of the other ingredients are a compound which is water resisting and alkali and fire-resisting, so that when the finished product is ready you receive a roofing that is better than shingles, tin, tar, or, in fact, anything that your grandfather or even your father ever knew.

It makes a roof that won't leak, won't rot, won't crack, won't melt and can't be set on fire by falling sparks.

The makers of this remarkable roofing have a booklet of photographs showing buildings of all kinds from Mexico to Maine that are todav proving this famous protection called Rex Flintkote Roofing.

Anyone who is interested and would like to know more and would like samples mav have them by addressing a postal to J. A. & W. Bird & Company, Boston, Mass.

WOODEN SOLES.

The convenience and protection afforded to workers in creameries, or rather places where wet cement has to be stood on all day, by heavy wooden soles is most acceptable to this class of workers. The O. J. Weber Co. has a full line of them in both boots, buckle shoes and even slippers. Drop in and take a look at them.

Smith's Cash Store, so long established in San Francisco, has not gone down in ruin. Their handsome six-story building near the Union Ferry Building was not damaged in the least by the earthquake, but a few hours later was totally destroyed by fire. Every particle of merchandise in the building was consumed. The firm is now established "Just around the corner" at No. 16. Steuart street on an L lot adjoining the original premises. Here has been erected a corrugated iron building stocked with goods and opened for business on the 8th of May. It illustrates the promptness with which business was resumed in the burned section.

Read the announcement of the Joshua Hendy Machine Works in this issue. Their temporary offices have been erected on the site of their factory at Bay and Kearney streets, San Francisco, and they are ready to supply orders on demand. While their down town offices were entirely destroyed by fire they are "still on earth'" and will build upon the ruins of their old a larger business than heretofore.

Queries and Replies

MARKET FOR MUSTARD.

We believe that if N. W. G., Santa Maria, will communicate with Mr. O. T. Nobman, (box 100) of same address he may learn something to his advantage regarding the sale of mustard seed.

GARDEN FERTILIZERS.

Editor Cultivator:—Please answer the following in your garden department. 1. Is nitrate of soda a good lawn fertilizer? 2. What is the best liquid manure for roses and garden plants in general?—E. G. L., Riverside.

1. Nitrate of soda is far from being the best, being more of a stimulant, and must be used with caution. So many other fertilizers with a stable manure base are on the market that we would not advise the use of nitrate, but to those who wish to use some of the more soluble fertilizers for their lawn, we would recommend one pound of either nitrate of soda or sulphate of ammonia to three pounds of the muriate or the sulphate of potash. About 50 lbs. of the mixture is enough for any ordinary city lawn. First class commercial fertilizers are now on the market, for lawn use, that are both safe and sure, and also economical.

2. Probably the best all round liquid fertilizer is made from cow manure. Dilute to the color of weak coffee and apply not more than once a week. Such applications are more beneficial than stronger doses at longer intervals.

DODDER.

Editor Cultivator:—If barley and alfalfa are sown together, and dodder is among the alfalfa, how soon after alfalfa is up will the dodder show and how does it look?—Subscriber.

The dodder has seeds which take root in the soil and puts forth a shoot which winds itself around some living plant. As soon as the plant obtains a good start the shoot disconnects itself from the earth and derives its norishment from the juices of the plants to which it clings. In this parasitic state the dodder has no need for organs of nutrition of its own, and nature therefore takes them away. In the case of this weed we have, then, the degraded spectacle of a plant without a root, without a twig, without a leaf, and having a stem so useless as to be inadequate to bear its own weight. An average plant bears about 2,500 seeds, so that the increase is something startling. The plant is insignificant when young and not easily noticed, as the alfalfa and barley grow so much faster. It should be easily recognized by the above description. In color the stems are a beautiful clear yellow. The minute flowers are white.

"FORGET IT."

A bit of modern and significant street slang is thus phrased: "Forget it." It needs interpretation, as does nearly all slang. As the street gamin uses it he means: "You are wrong. You have misconceived the matter entirely. Now don't continue harping on that erroneous idea, but get your mind right and fixed on something worth while." So he says, "Aw, furgit it."

"I do not mind that people know so much," remarked our great humorist, "but I hate it that they know so much that is not so." And had he said this a little later he could have added the bit of slang, "Forget it."

A little group of enthusiasts wished to run a corn train through the State of Indiana. Forthwith the men who "knew the state best" came to them and assured them that the idea was impractical, that Indiana farmers were staid and set, not wont to rush out to hear any new thing that came along, that the effort would prove very disappointing. Notwithstanding this the enthusiasts promptly "forgot it" and the train went. And the farmers fairly mobbed it! The embarrassment was of too many listeners to be reached.

In Kentucky the former Commissioner of Agriculture had learned that the farmers there were set and slow and non-progressive, that they could not be reached, that it was not worth while to waste effort on them. A new commissioner "forgot it" and went after them with institutes and a special train to preach the gospel of good seed corn and alfalfa culture, and in ten days reached nearly 12,000 people.

In several states today the men in charge of agricultural colleges have learned that their constituents are slow, careless, giving them little support. They are believing that the successful agricultural colleges belong to a region farther west, or north, or south, or somewhere else. They have only a half heart to ask legislatures to equip them and no heart at all to ask the people to come to a short course. Ah, forget it! Forget it! Make fit those colleges. Make ready the gospel trains, make ready the short course. Forget that half faith, that paralyzing fear. Believe that the men in your own state are as other men, with red blood and needs and desires. Go after them with the right bait of enthusiasm and earnest wish to help them. See, then, if they do not respond. Forget it! Let the dead past bury the dead past. This is a new age, and a new opportunity is born every hour.

And you, farmer, knowing well that you have been an indifferent farmer in the past, that you have robbed your soil and wasted your opportunities, forget it. Refuse longer to believe that you are necessarily bound with a heritage of bad practice. Get out to the short course, read, study, reform your practice, shelter your animals, save the manure, buy a spreader, sow clover or alfalfa. Forget that you were a leech upon the earth; become a creator of wealth instead.—Breeders Gazette.

YEAR BOOK OF AGRICULTURE.

The government of Victoria, Australia, has issued their first Year Book of Agriculture, which seems to be quite up to the standard of our own publications. It is hoped to continue the publication from year to year, permanently, and judging by the favorable comments of the Victorian press and farmers, its perpetuity seems assured.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the columns of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

BLINDNESS.

Editor Cultivator: I have a big half Maltese cat over whose eyes there is growing a thick white-blue skin. It covers about half of both his eyes. It grows faster every day and he will soon be blind. I want you, if you can, to please write and tell me what to do for him. He is a great pet and he catches his food and stays out of doors most all the time. The skin or scum looks like a cataract that comes on people's eyes.—L. T., Porterville.

Make a solution of nitrate of silver, five grains; water, one ounce; touch the parts once a day, using a camels hair brush.

MANURE SPREADERS.

One of the advantages the farmers of today have over those of past generations is in the use of improved farm machinery. Inventive skill and genius have been brought to bear on practically every farm operation so that today the farmer has only to set the machinery on the farm in motion ot accomplish in a few hours, the work of weeks a generation ago. One of the great "bugabears" of the farmers has been the removal of the barn yard manure from the yard to the field and properly distributing it. This labor has, in recent year, been very greatly simplified by the introduction of the manure spreader. The manure is thrown from the stable into the box, the team attached, the machinery set in motion, and the finely divided particles of manure are scattered over the land. There is no implement on the modern farm today which accomplishes its work more satisfactorily and with such pleasure to the owner as the modern manure spreader.

TO A DOG.

When some proud son of man returns to earth,
Unknown to glory, but upheld by birth,
The sculptor's art exhausts the pomp of woe,
And storied urns record who rests below;
When all is done, upon the tomb is seen,
Not what he was, but what he should have been:
But the poor dog, in life the firmest friend,
The first to welcome, foremost to defend,
Whose honest heart is still his master's own,
Who labors, fights, lives, breathes for him alone,
Unhonor'd falls, unnoticed all his worth,
Denied in heaven the soul he held on earth:
While man, vain insect! hopes to be forgiven,
And claims himself a sole exclusive heaven.
Oh man! thou feeble tenant of an hour,
Debased by slavery, or corrupt by power,
Who knows thee well must quit thee with disgust,
Degraded mass of animated dust!
Thy love is lust, thy friendship all a cheat!
Thy smiles hypocrisy, thy words deceit!
By nature vile, ennobled but by name,
Each kindred brute might bid thee blush for shame.
Ye! who perchance behold this simple urn,
Pass on—it honors none you wish to mourn:
To mark a friend's remains these stones arise;
I never knew but one,—and here he lies.
Lord Byron.

ONLY A DOG.

"Only a dog!" You wonder why
I grieve so much to see him die,
Ah! if you knew
How true a friend a dog can be,
And what a friend he was to me,
When friends were few!

"Only a dog—a beast," you sneer;
"Not worthy of a sigh or tear."
Speak not to me
Such falsehoods of my poor dumb friend
While I have language to defend
His memory.

Thro' ups and downs, thro' thick and thin,
My boon companion he has been
For years and years.
He journeyed with me miles and miles,
I gave him frowns, I gave him smiles,
And now, sad tears.

Before my children came, his white
Soft head was pillowed every night
Upon my breast.
So let him lie just one time more
Upon my bosom as before
And take his rest.

And when a tender love awoke,
The first words my baby spoke
Was "M-a-t." Poor Mat!
Could I no other reason tell,
My mother-heart would love you well
For only that.

Together boy and dog have laid
Upon my lap; together played
Around my feet,
Till laugh and bark together grew
So much alike, I scarcely knew
Which was most sweet.

Ah! go away, and let me cry,
For now you know the reason why
I loved him so.
Leave me alone to close his eyes,
That looked so wistful and so wise,
Trying to know.

At garden gate or open door
You'll run to welcome me no more,
Dear little friend.
You were so kind, so good and true,
I question, looking down at you,
Is this the end?

Is there for you no "other side?"
No home beyond death's chilly tide
And heavy fog,
Where meekness and fidelity
Will meet reward, although you be
Only a dog?

"He has no soul!" How know you that?
What have we now that had not Mat,
Save idle speech?
If from the Bible I can read
Him soulless, then I own no creed
The preachers preach.

My dog had love, and faith, and joy—
As much as had my baby boy—
Intelligence;
Could smell, see, hear, and suffer pain.
What makes a soul if these are vain?
When I go hence,

'Tis my belief my dog will be
Among the first to welcome me.
Believing that,
I keep his collar and his bell,
And do not say to him farewell,
But good-by Mat,
Dear, faithful Mat!
—Pearl Rivers.

("Pearl Rivers" was Mrs. Nicholson, for many years editor and proprietor of the New Orleans Picayune. —Ed.)

EULOGY ON THE DOG.

One of the most famous speeches ever made by the late Senator Vest of Missouri was made in the course of a trial of a man who had wantonly shot a dog belonging to a neighbor. Vest represented the plaintiff, who demanded $200 damages. When Vest finished speaking, the jury, after two minutes' deliberation, awarded the plaintiff $500. The full text of the speech is printed below:

"Gentlemen of the jury: The best friend a man has in the world may turn against him and become his enemy. His son or daughter that he has reared with loving care may prove ungrateful. Those who are nearest and dearest to us, those whom we trust with our happiness and good name, may become traitors to their faith. The money that a man has he may lose. It flies away from him, perhaps when he needs it most. A man's reputation may be sacrificed in a moment of ill-considered action. The people who are prone to fall on their knees to do us honor when success is with us may be the first to throw the stone of malice when failure settles its cloud upon our heads. The one absolutely unselfish friend that man can have in this unselfish world, the one that never deserts him, the one that never proves ungrateful or treacherous, is his dog.

"Gentlemen of the jury, a man's dog stands by him in prosperity and in poverty, in health and in sickness. He will sleep on the cold ground, where the wintry winds blow and the snow drives fiercely, if only he may be near his master's side. He will kiss the hand that has no food to offer, he will lick the wounds and sores that come in encounter with the roughness of the world. He guards the sleep of his pauper master as if he were a prince. When all other friends desert he remains. When riches take wings and reputation falls to pieces he is as constant in his love as the sun in its journey through the heavens. If fortune drives the master forth, an outcast in the world, friendless and homeless, the faithful dog asks no higher privilege than that of accompanying him to guard against

NECESSITY VS. LUXURY
The day has gone by when the farm telephone is considered a luxury—time was and not so long ago at that, when a telephone in a farm-house was looked upon as such. ***Today it is a necessity.***
THE WILLIAMS FARM TELEPHONE
has had a lot to do with bringing about this change, making it easy for the farmer to form his own telephone company at no great cost—keeping him ever in touch with his doctor, dealer, banker, freight-agent, and all others in a business way—to say nothing of the social side, putting him in communication with his neighbors at will. Think it over and write us for booklet "Over the Wire." THE WILLIAMS TELEPHONE & SUPPLY CO.

COLONIST RATES TO CALIFORNIA
Santa Fe
Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.
Following are a few:
Chicago........................$33.00 Kansas City & Leavenworth $25.00
St. Louis........................ 30.00 St. Joseph & Atchison....... 25.00
Galveston .... 26.45 Council Bluffs & Omaha..... 25.00
Dallas, Houston and Fort Worth........................ 25.00
Nearly all points in Kansas, Oklahoma and Indian Territory... 25.00
Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.
Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.
California illustrated literature mailed free to any address or may be had from Santa Fe representatives.
Tourist Sleeping Car Lines
Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Choice of
MANY ROUTES
East and West
SOUTHERN PACIFIC
SUNSET Via New Orleans and El Paso
OGDEN Vian an FraScisco
SHASTA Via Portland
Pullman Vestibuled Trains Daily. Personally Conducted Tourist Excursions via all routes every day in the week at Reduced Rates. The SOUTHERN PACIFIC gives you choice of many routes from the northern boundary of the United States to the Atlantic Coast, so that you may go one way and return another, with varied scenery and climatic conditions.
Full information at 261 S. Spring St., Los Angeles, or from any agent
SOUTHERN PACIFIC

A Delightful Way to Go East
Is Via The
Scenic Salt Lake Route
Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City, thence over the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's
BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.
SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.
THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.
SALT LAKE ROUTE
THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.
DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.
EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.
EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:
May 25, 26 and 27—New Haven, Conn. Rate 92.10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50. St. Paul and Minneapolis, $70 00. St. Louis, Memphis and New Orleans, $67.50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.
Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returuing.
T. C. PECK, A. G. P. A., Los Angeles, Cal.

danger; to fight against his enemies, and when the last scene of all comes, and death takes the master in its embrace and his body is laid awav in the cold ground, no matter if all other friends pursue their way, there by his graveside will the noble dog be found, his head between his paws, his eyes sad but open in alert watchfulness, faithful and true, even to death."

A REMARKABLE BUT TRUE STATEMENT.

Hon. Francis S. Hesseltine of the Boston Bar sends the following written to him by Dr. J. Langdon Sullivan, a prominent physician:

"The facts you ask for are as follows: Twenty years ago a gentleman brought to my office a large, very handsome intelligent spaniel dog whose nigh foreleg was badly broken, the bone being grown out of place. On the master's assurance that the dog would not bite me I set the leg. Drawing the bony fragments into place caused severe unavoidable pain. The animal whimpered, but displayed no anger, and allowed the dressing to remain undisturbed until I removed it when firm union had resulted. I saw no more of my canine patient or of his owner for two years. Then (again on a summer's morning) I heard a loud scratching at my office door. I opened it and there stood my old spaniel friend, wagging his tail. Beside him stood a fine black-and-tan with a round French nail driven clear through his right paw. I patted the spaniel, called both dogs in, removed the nail and sent both away happy, trotting side by side as if nothing had happened. I have never seen anything of either since."

OAK POISONING.

At this season poison oak cases are very numerous. As the camping season opens and picnics become numerous this painful and distressing affection will be common in all parts of the State.

Some years ago the Department of Agriculture at Washington published a bulletin with relation to poison oak and poison ivy, giving the results of a special scientific investigation. The cause of the trouble was stated to be a recently discovered non-volatile oil called toxicodendrol. It is very irritating to the skin in a manner only too well known. Since it cannot be dissolved in water, washing is of little use. It can, however, be dissolved and converted into a soap by the addition of alkalies such as ammonia, washing soda and caustic potash or soda. It is also readily dissolved in alcohol. All these may be used in case poisoning should occur, but there is a better remedy which may be made as follows: In a bottle of grain alcohol put and shake as much acetate sugar of lead as will dissolve: then add a little more lead, so that when shaken the mixture is milky. When needed, rub the shaken mixture upon the affected parts several times a day until all irritation ceases. If too strong, the mixture should be diluted with water, but more lead should be added.

Should poisoning occur and this preparation not be obtainable, hot soapsuds, with some soda or other alkali added to it, may be used. This should not be relied upon unless the poisoning is very fresh. Advanced cases should be treated with the above remedy.—Sacramento Bee.

PTOMAINE POISONING.

That our readers may be warned of dangerous combinations of foods we print the following dispatch sent out from Richmond, Ind., last week:

Richmond, Ind., May 11.—Miss Clara Reckers, 20 years of age and prominent in society, died last night from ptomaine poisoning. An autopsy today showed that a combination of spinach and strawberry shortcake had resulted in chemical changes which caused death. Physicians worked for hours in an effort to save her but she expired in great agony.

She had partaken freely of spinach at the noon meal and at supper she dined chiefly on shortcake and rich cream. An hour later she was in spasms.

Examinations of remnants of both foods show that neither contained any poison, but that death was due to combinations.

Physicians say the same effect would be produced by eating freely of bananas then drinking whisky, the combination which killed Patrick Gilmore, the great bandmaster.

* * *

Of course this is an extreme case, for spinach is easily digested and in a normal stomach would not have remained till supper time.

Chums

CONCERNING COLD BATHS.

Cold baths in the morning are undoubtedly beneficial, but only to those persons who have sufficient vitality and nervous force to insure good reaction.

Many persons who are greatly refreshed by their morning cold bath feel tired or languid two or three hours afterward. When this occurs they should leave the baths severely alone.

Persons who have an abundance of blood and flesh, who are lymphatic or sluggish in temperament and whose nervous force is not depleted can take a cold bath to advantage.

Those who are inclined to be thin, whose hands and feet become cold and clammy on slight provocation, who digest food slowly, and assimilate it slowly with difficulty, who are nervous and who have much on their mind, should avoid early morning cold bathing,

For such, a warm bath before retiring at night is recommended.

SEWING ON A BUTTON.

It is bad enough to see a bachelor sew on a button, but he is the embodiment of grace alongside of a married man. Necessity has compelled experience in the case of the former, but the latter has always depended upon some one else for this service, and fortunately, for the sake of society, it is rarely he is obliged to resort to the needle himself. Sometimes the patient wife scalds her right hand, or runs a sliver under the nail of the index finger of that hand, and it is then the man clutches the needle around the neck, and, forgetting to tie a knot in the thread, commences to put on the button. It is always in the morning, and from five to twenty minutes after he is expected to be down street. He lays the button exactly on the site of its predecessor, and pushes the needle through one eye, and carefully draws the thread after, leaving about three inches of it sticking up for leeway. He says to himself, "Well, if women don't have the easiest time I ever see." Then he comes back the other way, and gets the needle through the cloth well enough, and lays himself out to find the eye, but in spite of a great deal of patient jabbing, the needle point persists in bucking against the solid parts of the button, and finally, when he loses patience, his fingers catch the thread, and that three inches he had left to hold the button slips through the eye in a twinkling, and the button rolls leisurly across the floor. He picks it up without a single remark, out of respect for his children, and makes another attempt to fasten it. This time, when coming back with the needle, he keeps the thread and button from slipping by covering them with his thumb, and it is out of regard for that part of him that he feels around for the eye in a very careful and judicious manner; but eventually losing his philosophy, as the search becomes more and more hopeless, he falls to jabbing about in a loose and savage manner, and it is just then the needle finds an opening, and comes up through the button and part way through his thumb with a celerity that no human ingenuity can guard against. Then he lays down the things, with a few familiar quotations, and presses the injured hand between his knees, and then holds it under the other arm, and finally jams it into his mouth, and all the while he prances about the floor and calls upon heaven and earth to witness that there has never been anything like it since the world was created, and howls, and whistles, and moans, and sobs. After awhile he calms down, and puts on his pants, and fastens them together with a stick, and goes to his business a changed man.

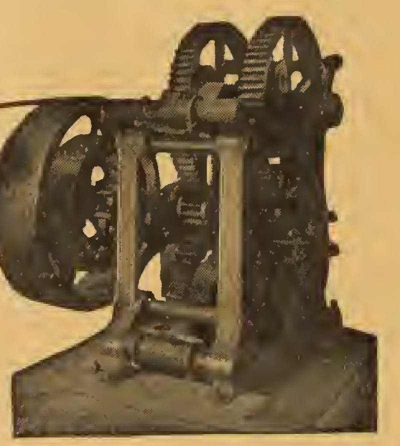
The Pomona Pump



☐ The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosph r bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the oest by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

LAMBS—Per lb: Yearlings, 4½@5c.

HOGS—Per lb: Hard grain fed, weighing alive 80 to 130 lbs. 6c; 130 to 180 lbs, 6½c; 250 to 350 lbs. 6c; rough heavy, 4@5c; common 3½@4c.

Flour and Grain.

FLOUR—Net cash: Family Extra, $4.70@5.10 per barrel; Bakers' Extra, $4.40@4.75 per barrel; Oregon and Washington, $3.50@4.

WHEAT—No. 1 shipping, per cental, $1.30@1.32½; inferior grades, $1.25@1.27½; white milling, good to choice, $1.32½@1.37½, with fancy up to $1.40.

BARLEY—No. 1 feed, $1.10@1.12½; common to fair, $1@1.08¾; brewing, nominal.

OATS—White, $1.35@1.60; red, $1.50@1.60; black, $1.30@1.40.

RYE—$1.47½@1.55 per cental.

CORN—Small round yellow, $1.55@1.65; western, mixed, $1.32½; yellow, $1.30@1.37½; white, $1.35@1.40 per cental.

Hay and Feedstuffs.

Arrivals of hay on the San Francisco market during the past six days have amounted to 2699 tons. Conditions in the trade have not been isfactory. It has been impossib get supplies enough to furnish the demand. There is plenty of hay being loaded at railroad points, but the rail road does not bring the hay into San Francisco as shipped. During this week on one day there were only two cars came into San Francisco, on another day only three cars, and another day only five cars. This condition has caused terrible inconvenience to all parties concerned here. It is impossible to supply the demand with what they need of the different qualities. We had expected that the new hay would relieve the situation, but the recent heavy rains have damaged what was baled, and delayed further baling and shipping for the moment. Prices on hay have continued very largely nominal, as the question has not been price, but ability to get the hay of suitable quality to meet the requirements of the consuming trade. There has been some little inquiry lately for shipping hay, but some orders could not be filled for the reason that the hay was not at hand. The trade for alfalfa hay is very light.

Straw continues in moderate supply, with a demand about equal to the amount that is offered.

HAY—Per ton, choice wheat, $13@17.50; wheat and oat, $10.50@14.50; oat, $9@13.50; barley, nominal; alfalfa, $10@12; new first crop, $6@8; stock, $7@7.50.

STRAW—Per bale, 40@60c.

FEED—Mixed feed, per ton, $24@25; Calfalfa Meal, $23.50; carload lots, $22; Mealfalfa, per ton, $23.50; carload lots, $22.

BRAN—Per ton, $19@21.

MIDDLINGS—Per ton, $27@30.

GROUND BARLEY—Per ton, $24@26.

FEED CORN MEAL—Choice grades, per ton, $28@29.

CRACKED CORN—Choice stock, per ton, $29@30.

COCOANUT CAKE—In lots of 10 tons, $23; 5 tons, $23.50; less quantity, $24. Prices are mill rates and are subject to change without notice.

OILCAKE MEAL—Mill rates in 5-ton lots, $37.50; jobbing, $38@38.50.

Beans and Seeds.

BEANS—Prices per ctl.: Large white, $2.40@2.60; small do, $3.25@3.45; pea, nominal; Lima, $4.50@4.60; red, $3.75@4; pink, $1.75@1.90; Bayo, $3.75@4; blackeyes, $5.25@5.50; red kidneys, $3.50@3.75; horse beans, nominal.

SEEDS—Brown mustard, $4.50@4.75; yellow mustard, $3.50@3.75; Flaxseed, $2.50@3; canary, 6@6¼c; alfalfa, 12c; rape, 2½@3c; timothy, 5c; hemp, 5@5½c per lb.; millet, 3@3¼c.

DRIED PEAS—Niles, $1.85; green peas, $2.25@2.50 per ctl.

Hops.

Desirable grades of California crop of 1905 sell at 7@10c per lb; 1906 crop, for future delivery, 8@11c.

Hides and Wool.

Wet Salted Hides—No. 1 sound, per lb., heavy steers, over 50 lbs, 13c; medium steers, over 48 lbs., 12c; heavy cows, over 50 lbs., 12c; light hides, 12c; kips, 13c; veal, 13½c; calf, 14c; stags and bulls, 8½c; No. 2 hides, 1c per lb less.

Dry Hides—per lb: No. 1, 22c; No. 2, 18c; dry calf, No. 1, 24c; No. 2, 22c.

Horse Hides—Salted, large, $3@3.25 each; medium, $2.75 each; small, $2.25 each. Dry—Salted, $2@2.25 each; medium, $1.50@1.75 each.

Sheep Pelts—Long Wool Skins, $1.25@2 each; medium wool skins, 90c@$1.10 each; short wool skins, 50@75c each; shearings, 20@40c.

CITRUS MARKETS

New York, June 5.—Twenty nine cars sold yesterday in a brisk market, the demand being most unusually strong with the expectation of a continuance at least until the navels are all in. Seventeen cars were sold at auction today. The market is very strong and the weather favorable.

FARMER'S VECETABLE CARDEN

Continued from first page.

passed through the fermenting stage before being used. The use of night soil generally is not to be recommended, as its aplication, unless properly treated for the destruction of disease germs may prove dangerous to health.

For garden crops there is no fertilizer that will compare with good, well rotted barnyard manure. In localities where a supply of such manure can not be secured it will be necessary to depend upon commercial fertilizers, but the results are rarely so satisfactory. In selecting manure for the garden, care should be taken that it does not contain any element that will be injurious to the soil. An excess of sawdust or shavings used as bedding will have a tendency to produce sourness of the soil. Chicken, pigeon, and sheep manures rank high as fertilizers, their value being somewhat greater than ordinary barnyard manures, and almost as great as some of the lower grades of commercial fertilizers. The manure from fowls is especially adapted for dropping in the hills or rows of plants.

Commercial fertilizers are sold under a guaranteed analysis, and generally at a price consistent with their fertilizing value. No definite rule can be given for the kind or quantity of fertilizer to be applied, as this varies with the crop and the land. At first the only safe procedure is to use a good high-grade fertilizer at the rate of from 1000 to 2000 pounds to the acre and note the results. Market gardeners frequently apply as much as 2500 pounds of high-grade fertilizer per acre each year.

If you want an apple orchard and chicken ranch in the far famed Pajaro Valley, the largest and best apple growing section west of the Missouri river, read the advertisement of the Pajaro Valley Implement Co. in this paper. Watsonville is a thriving and beautiful city and the country around it cannot be surpassed for beauty and fertility.

Fortunately escaping the disastrous fire that swept so many San Francisco firms out of business the Pacific Implement Co. are at their old quarters, 133-153 Kansas St., amply equipped for business in all lines. Their advertisement appears in this issue.

H. M. Warren, of Santa Cruz, advertises Indian Runner ducks from his famous stock in the Cultivator this week. Mr. Warren is one of the old reliable fanciers of the state.

RUPTURE

Absolutely corrected. Examinations free. I furnish addresses of my many soundly cured patients and contract to refund all money if unsatisfactory. Also make 14 kinds of Trusses, Elastic Stockings, Suspensories. Correct deformities and all physical weaknesses.

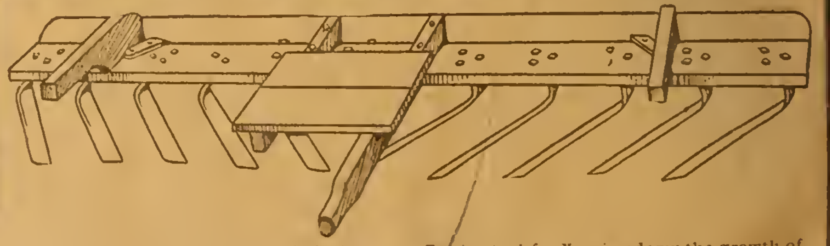
THE

Killefer Clean Cut Weeder



Is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. It does twice the work of any other tool with the same power. The knives overlap so it is impossible to miss any weed. Built in 6, 8, 10 and 12 foot sizes. The patented knives are so formed that they wear uniformly from heel to point, causing them to wear twice as long as any other blade for the same purpose. It is ***the*** tool for weed killing on any kind of cultivated land. Blades can be attached to cut in or out as desired.

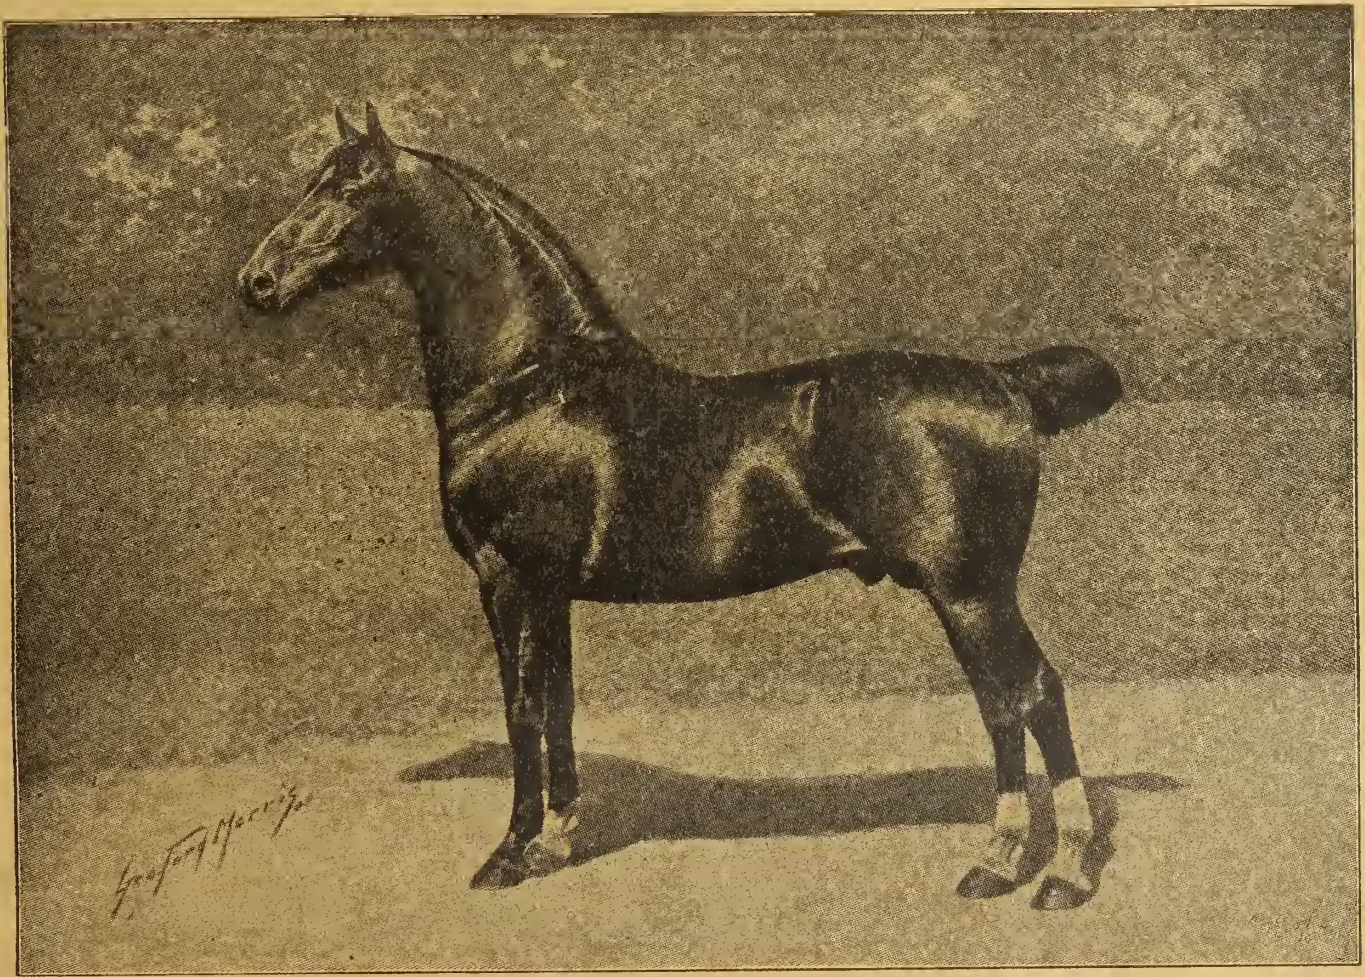
LOS ANGELES JUNE 14, 1906 SAN FRANCISCO



CHAMPION FRENCH COACH STALLION PALADIN 1968.

At the head of the famous Oaklawn Farm Stud of French Coach Horses of Dunham, Fletcher & Coleman, Wayne, Du Page County, Illinois.

The Coach or Carriage Horse.—The distinguishing features of the coach or carriage horse are its symmetry and action. The height should be about 16 hands to make a good appearance. In contrast with the roadster the carriage horse is very smooth and symmetrical. The smoothness should be due to plumpness of the muscle over all parts. In the carriage type the head should be comparatively small and lean, the ear neat, the neck long and carried gracefully, the body round and plump and the limbs clean cut, with well formed and durable feet. Graceful carriage and action are leading qualifications.

ANOTHER GAS ENGINE TO THE FRONT.

Ex-Senator Dorsey has recently installed a pumping plant on his ranch near Pasadena, consisting of a 40 H. P. Stover gas engine and Addison pump.

The Stover engine was introduced into this field about a year ago and has made such rapid strides within that time that the Southern California agents, Livingston and Lee, have put up a splendid sample room in connection with the shops of the Commercial Engine Company, 953 North Main street, Los Angeles, and are well equipped to figure on anything from 2 to 40 horsepower.

Mrs. A. M. Cary has a 25 horsepower running and a No. 6 Byron Jackson pump near Rivera and altogether the opening of a tardy pumping season looks very bright.

The Stover engine has less working parts than any engine on the market and has combined some of the good features of old lived engines with modern and up-to-date improvements, so that after a person has seen one running they cannot help but conclude that the troubles of the gasolene engineer are about over.

The new speed regulating attachment recently introduced on these engines is worthy of more than passing notice, as it puts the speed of the engine under almost as perfect control as can be obtained on a well regulated steam engine. This point of course is commendable on drilling rigs, wood sawing outfits, and, in fact, in any place where change of speed is necessary. By simply touching a light lever the speed can be moved up or down, notch by notch, and yet the whole apparatus is so simple we wonder it was not thought of before.

On the whole the Stover engine bids fair to become a keen competitor in the race for a portion, at least, of the trade of this splendid market, and anyone interested directly or indirectly in gas engines will find a half hour spent in the salesroom of Livingston and Lee, 953 N. Main st., well worth while.

SELECT YOUR LAYING HENS.

It is desirable that the hens lay large eggs, and while some breeds lay larger eggs than the average, yet there are individual hens of all breeds that excel in that respect if the conditions are favorable. What is meant by large eggs is not such as may be of abnormal size, or approaching those which contain double yolks, as only the hens that are overfat lay double-yolk eggs, but eggs of an average size and uniform in appearance. When the eggs are uniform they present a more attractive appearance in market, and bring better prices. When pullets are just beginning to lay it is more usual for the eggs to be small than of an average size, and the same thing happens to both hens and pullets when they are near the end of their laying period, especially when about to molt. The feed has also something to do with the matter, as it has been noticed that hens which are well fed and receive a liberal allowance of corn lay larger eggs than those which receive a less quantity of grain, but there is no uniformity in the size of eggs from a whole flock, as the hens differ. Even two sisters may lay entirely unlike in every respect.

At the New Jersey Agricultural Station, in 1904, dried beet pulp was compared with dried molasses beet pulp as regards influence on yield of butter and milk, etc. The test was made with four cows and lasted 30 days and indicated that the addition of molasses to beet pulp is no advantage in feeding for the production of milk.

Fifty Cent Pieces Running Around on Legs

And How They May be Made to Earn Five Dollars Profit

The ordinary laying hen sold in the market would bring about 50c; therefore a flock of common hens might be known as 50 cent pieces running around on legs.

But, you take these hens and feed them once a day a meal of **COULSON'S IMPROVED MASH EGG FOOD**, and these hens will coin money for you every day.

According to San Francisco market prices for eggs, a good hen (fed on Coulson's Mash Egg Food every day) will lay enough eggs in a year to value somewhere between $3.00 and $4.00. Feed the hens for 2 years on **Coulson's Improved Mash Egg Food**, and during this time they will lay enough eggs to earn $5.00 per hen profit, more than the cost of the feed. Then you can send the hens to market and get the original value of 50c back again for her.

So when you can make $5.00 gold pieces out of 50 cent pieces, by feeding the hens **COULSON'S MASH EGG FOOD**, you can't make money any easier.

A word to the wise is sufficient. It is to your best interest. Go to your store-keeper and order a few bags of Coulson's Improved Mash Egg Food.

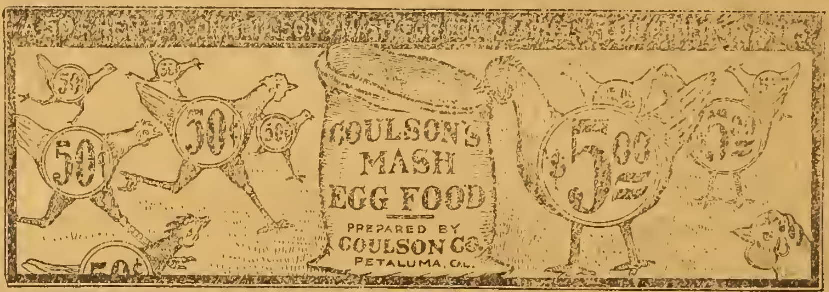
RAISING CHICKENS?

I Certainly Would Feed Them Coulson's Mixed Poultry Foods. Why?

Johnny Bull Tells Why He Would Use Coulson's Poultry Feeds.

1st. I know how nice Mr. ——— hens looked when I saw them; what nice red combs they had, and what nice healthy birds his hens were. I know that Mr. ——— was getting two cases of eggs a week in the Fall of the year from 350 hens, when other people's hens were not laying at all, and when eggs were bringing him 51c per dozen; and he has been feeding Coulson's Feeds for over a year, which show how good the feed is, for his hens netted him a profit of $2.00 apiece last year. Most people only make $1.00 per hen per year.

2nd. I know that there are other large poultry ranchers near Petaluma who feed Coulson's Feeds. For instance, Mr. Geo. Gaston has FED THE FEED FOR THREE YEARS every day to 3000 hens. Then there is Mr. W. W. Freeman, who has fed Coulson's Poultry Foods for about three years to 4000 hens; and Mr. De Rezendes at Tomales, has fed several thousand bags of it and buys it in car lots. All these are successful poultrymen, and if the feed was not good they would not continue to use it so long, and their being successful poultrymen, they know that Coulson's Egg Food GIVES THEM MORE returns than any other feed for the money.



3rd. Then there is Mr. Henry Graff, former President of the Pacific Coast Poultry Association, and a very successful poultryman, who makes his flock of 2000 hens average 184 eggs per hen per year, which is nearly $4.00 per hen, according to the market price for eggs in San Francisco last year. I know that if these successful poultrymen use Coulson's Foods, then I should use them too.

Hens Need a Good Balanced Ration

4th. Then I know that hens need a Balanced Ration, and that they need Meat Meal, Blood Meal, Bone Meal, and such things, and they get all these in Coulson's Foods. I know that if I were to go to a store to buy these Meat Meals, Blood Meals, Bone Meals, etc., that I would not be able to get anything good, for it would all be fertilizer stock, which would not be very good to feed to the hens, as it would not agree with them, and therefore prevent them from giving good results. In any case the stores from which I could buy these articles, would charge me a high price for them, as they only handle them in small quantities, while the Coulson Co. get these supplies (Meat Meal, Blood Meal, Bone Meal, etc.) by the carload, and therefore, can afford to sell cheaper, and I will get them ALREADY MIXED with the feed.

Healthy Hens are Profitable Hens

5th. I know it PAYS TO KEEP THE HENS HEALTHY, and that the hens need Flaxseed Meal, Condition Powders, Charcoal, etc., and that they get all these in Coulson's Feeds. I want my hens to be healthy, and not sickly, like other people's, which I have seen, where they were fed only cheap feed, and I know that if I feed them Coulson's MASH EGG FOOD, they will get all they require to keep them healthy, and they WILL DO SO WELL on it.

6th. What is the use in spending so much time every morning, mixing up a little chicken feed, when I can get it already mixed by machinery, and when it contains everything that is needed? All I have to do is to take the feed out of the sacks and mix it with a little water, and it is ready for the fowls; whereas, when I mix it by hand, it would take at least two hours every morning, and then it would not be mixed as well as when it is mixed by machinery.

Cost Is Not Much--Two Pounds Feeds a Hen a Month

7th. Coulson's Mash Egg Food doesn't cost much, a 90-pound sack will make a meal for 1250 hens. A little more than two pounds will feed a hen for a month, and if a hen lays three eggs a month, it pays for the feed; and I know of some hens that were fed on Coulson's Feed, that laid 23 and 24 eggs a month.

Profit In It for the Feeder

8th. It's results that I'm after. So long as I am keeping hens, I am going to make as much profit out of them as I can. I know a poultryman at Elmira, with a small flock of 400 laying hens, which he fed every day on Coulson's Mash Egg Food, and he sold over $1100.00 worth of eggs from them in one year, making nearly $700 clear profit from 400 hens, fed on Coulson's Feed. You bet, it pays to feed the laying hens, COULSON'S IMPROVED MASH EGG FOOD.

What the Little Chicks Would Be Fed On

9th. I would feed the baby chicks on Coulson's Special Dry Chick Feed every time, especially until they get to be 6 or 7 weeks old, anyway. I would scatter cut chaff on the brooder house floor, and would spread the Coulson's Special Dry Chick Feed around in this. This would give the chicks splendid exercise and keep them busy and contented; and in this feed they would get all that they required to build up their bodies, and what a delight it is to see them grow—why, every day you can see them getting bigger. A 100-pound sack of Coulson's Special Dry Chick Feed will feed 300 little chicks for the first three weeks or longer, so the cost would only be about 1 CENT PER CHICK for the feed for the first three weeks.

10th. I know one poultryman that raised 800 chicks up to two months on Coulson's Special Dry Chick Food, at a cost of 4½ c per chick, for the feed, and he only lost 29 chicks out of the 800 when I saw them, and such fine looking fellows too.

After the chicks got to be 6 weeks old, I would give them one meal a day of Coulson's Growing Chick Feed, and after they got to be two months old, I would give them two meals a day of the Growing Chick Food, and one meal of the whole wheat or cracked wheat. At about 11 weeks of age, I would send the roosters to market, and commence feeding the pullets on Coulson's Balanced Ration Mash Egg Food once a day, and whole wheat two meals a day. And I venture to say that I would soon have a flock of birds that would average me over $2.00 per hen per year profit—by feeding them Coulson's Mixed Poultry Feeds or Balanced Rations.

Ask your dealer about Coulson's mixed poultry feeds manufactured by

4 CENTS A MONTH
to feed a hen Coulson's IMPROVED Mash Egg Food Every Day. Two eggs a month pays for the feed and when you get 18 to 20 eggs a month think of the money the hen earns for you.

The Rural Home and the Rural School

Some philosopher has said that the best crop raised on the farm is the children. We all believe it. Persons reared in rural districts have occupied very important places in the professions and business life of the country. Or if they remain on the farm, their hope for success is much greater if they are well educated. Yet we oftener see fine barns than fine schoolhouses in the country districts.

We sometimes act as if the country school belongs to the teacher. If every person felt that the school belongs in part to him, he would be likely to see that the school gives better returns; and this would lead to giving some attention to the school property even if he cared nothing for the instruction given in the school. How many farmers or farm women really know how their schoolhouse looks on the inside? How many would recognize a photograph of the inside? If the teacher punishes your child you rebel and perhaps report the occurrence to the trustee; but the child may be unhappy every day and all because of the wretched condition of the schoolhouse and the outhouses. Calculate how many hours your child spends each year at the school: what impressions are influencing its life all this time?

* * *

Teachers underpaid.—Following is the substance of a letter written by the trustee of a certain school district to the commissioner:

"We want a teacher for our district school. Most anybody will do, for the children are all small and there are not many of them. Will you give a temporary license to Miss ———. She failed in her examination for a certificate, but she lives in the district, and we can get her cheaper than some one from a distance who has a certificate."

One woman heard about the letter, and told her neighbor. They protested. They had pride in the neighborhood and the school. Other neighbors were consulted. The little school house had sent out some boys and girls who had amounted to a great deal in the world, and they believed its usefulness as a factor in education was as promisiing as ever. Thereupon a movement was started for better pay for the teacher. in order that better teachers might be secured.

* * *

The office of trustee.—The farmer who had been elected in a certain district declared that he did not want the office. He said it took too much time, and there was no pay in it. Besides, he could not please every one. But they elected him, and at the same time voted enough money to run the school upon as economical a basis as possible. The district had a small valuation, and this year farmers did not have a large amount of money with which to pay school taxes. The trustee was instructed to hire a teacher who could pass an examination, and to get her as cheaply as possible. The whole tendency was to run the school so cheaply that it had no tone. The enterprise seemed to be hardly worth the while for the busy man.

* * *

The rural school teacher.—She has to hear more classes and cover more work than one who has but two grades. She must be prepared to teach all parts of the arithmetic every day, when perhaps a grade teacher in the village school teaches only decimals and fractions the year around. Then the rural teacher does not have a principal to aid her in disipline, nor much of any library and apparatus to assist in her work as teachers have in the union schools. Here is the experience of one teacher: She had hoped she might teach in a union school, where the wages were better. but she found that her expenses would be nearly double, and she decided to use her very best energies toward making a model country school. Some of her friends offered sympathy because she would not have much company nor hear concerts and lectures. But she went bravely to the district on Saturday before school opened, and as she drove over the country road she felt a sympathy for her frends in town, because they could not live as near nature as she could live. The country has its recompense.

A Model Country House.

* * *

To mothers and teachers.—One Saturday early in a term the women in one district were all invited to the school building. Some of these neighbors, though living far apart, had not met for weeks, and it was a treat to them to be invited by the teacher. She made tea upon the schoolhouse stove. Nothing was said about improvements or the necessity of them until, as the wind blew, they had to move away from the lose-fitting sashes and broken window lights. The sun shown in through the uncurtained windows into the faces of the guests. The seats soon became very uncomfortable. These mothers discussed the possibilities for making more homelike surroundings. They suggested a plan, which was approved by their sisters, and the next Saturday found these same mothers at the school again. It was not tea simmering on the stove this time, but hot water in large quantities. Soap was there and scrubbing utensils. The application to the floor, to the ceiling, to the walls, to the windows, of soap, water and muscular effort wrought a complete change. They even scrubbed the tops of scarified desks which had seldom seen soap and water. Sleeves of all conditions had passed over the surface of the desks term after term, and soap and water removed the abiding place of dangerous germs. Then came the paste pot. The old paper had been torn from the walls. They had prevailed upon the trustee to buy some inexpensive paper and these women papered the school room. Then they blackened the stove. It shone as it never had since it was new. A schoolhouse stove really needs blackening occasionally, For curtains they had secured a roll of heavy brown manila paper and cut it to fit the windows. Sticks were pasted on it at the top and bottom, and the new curtains hung with a cord attached to fasten them at the required height. Cloth shades and roller attachments can be secured at the store for twenty-five cents each. These present a better appearance than the ones described. but cost more.

* * *

Better sanitary conditions.—They curtained off a corner of the room where a bench was placed, holding a basin and soap. The women agreed among themselves to keep the school supplied with towels. The water pail was provided with a cover to keep out the dust, because the danger of disease from school dust is great. The cup had been used by all the pupils. and now it is agreed that each child shall have in his desk his own individual cup. A basin was provided into which to empty the water remaining in the cup after each child drank.

* * *

Pictures and flowers.—Some inexpensive but artistic pictures, copies of masterpieces, and mounted by the teacher, were placed upon the walls; and who can estimate the artistic and educational value in a child's life of good pictures The pupils brought flowers, the lilacs, myrtle, apple blossoms and pansies, all packed together and tied with a string. Instead of packing them still tighter into disused ink bottles, our teacher separated them. letting the lilacs fall into graceful lines as they grew on the trees. In a small flat dish she arranged the dandelions, and in taller, plain, inexpensive vases she arranged the slender stems of taller flowers. The schoolroom was made into a veritable flower garden some days, and the girls were unconsciously learning lessons which would make them more artistic housekeepers.

* * *

Home and school united.—How proud these children were when the teacher went home with them! They told the other children about it the next day, and were proud little entertainers. They learned from her a great deal more about living than they ever could in the formal work of the schoolroom. She entered into the spirit of the home and every woman felt comfortable and happy with her there because she was a partner in the care of the best they had—their children—and because she was interested in their household duties. She found the farmers' wives as bright and intelligent a class of women as she had ever met, but they were busy from morning till night. She believed they would accomplish just as much and be in better condition to do for others if they had more recreation. The teacher and mother tried to keep up their Saturday afternoon meetings. One read aloud while others mended or sewed. They discussed with the teacher various subjects which would benefit the children. They talked over household problems and some of them added to the pleasure of the others by "brushing up" their music which, in their busy lives, they were fast forgetting.

* * *

Men become interested.—One even-

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

THE MILLENNIAL GRAPE.

There has been considerable interest created in the Millennial grape during the last year or two. It has been taken up by experimenters on the desert with the hope that it may prove an early grape suitable for shipping. The originator, Mr. John Mathiasz in Hungary, claims that it has about all the good qualities that can be desired in a grape. Great vigor, strength and productiveness of vine, exceptional beauty, fine flavor, and excellent keeping and shipping qualities of the fruit. The claims have been borne out to a large degree by Mr. George Husmann of Napa. This grape has apparently been well tested as it has been grown in Europe since 1887 and in California since 1889. We saw a vine growing at Brawley, that was not so far advanced as Malaga. Luglienga growing beside it had grapes just ripening, would apparently be ripe the first week in June.

* * *

PRUNES.

The prune crop of Santa Clara valley is estimated to be 110,000,000 lbs. for the coming season. This is 5,000,000 pounds more than the combined crops of 1904 and 1905. During the season of 1900, California produced 130,000,000 pounds and France exported about 100,000,000 pounds. The figures on the estimate of the coming crop would indicate that there is no danger of an over surplus that would keep prices down. The prunes that Washington and Oregon turn out will not materially affect the California crop. Eighty per cent. of their prunes are Fellenberg, Italian prunes and do not come directly into competition with our French prune. They are falling into disfavor with the Washington and Oregon growers on account of shyness of bearing, tough skin, large pit and some other minor objections. The prune orchards of Washington, Oregon and Idaho amount to about 50,000 acres which produce about 12,000,000, pounds of prunes.

The prune industry in the northwest began in Oregon in 1860. The area of finer varieties will in all likelihood not increase very rapidly over the total now grown as the greater part of it will no doubt be changed gradually. The glut that was on the market during the last few years will act as a check on planting for years to come.

The history of prune growing in western Europe is interesting. Prune growing there dates back about one thousand years. It would seem that all that is desirable in varieties and methods might be found there, but there has been practically no change in that region during the last four hundred years. The great majority of prunes grown in France are grown in small lots mixed with all kinds of friuts and shrubs. The entire acreage of prune growing in western Europe embraces about two thousand square miles.

The French prune in its present state is not so popular as it used to be and an effort is being made to put it on the market in a pitted state. This is not practical at this time but if the product shows signs of becoming popular there will be machines invented which will make the product a commercial possibility. The pits are not only a useless part of the prune as a food but are an undesirable adjunct while they are the most expensive part to raise, drawing more fertilizer material from the soil than the entire flesh of the prune does.

A large quantity of the inferior grades of prunes are worked up into jams, butters. jellies and marmalades with other fruits, the prunes being used as a foundation. The culls and poorest grades are made into brandy which sells at a much higher price than other brandies. We have not introduced these branches of the industry into California prune growing to any great extent. There seem to be great possibilities in the jam, etc., line and if we get free alcohol for industrial purposes, there will be another outlet for the culls and lower grades.

* * *

CODLING MOTHS.

The codling moth, like the poor, is always with us. We expect some time to run him out with some sort of a bug, and we now have under way in the northern part of the state, some experiments with an imported insect that promises to practically exterminate this subtle pest of the apple grower. Should the State Board of Horticulture be as successful in this as it was with the Vedalia, it will pay for itself over and over again more than it has cost the state, as it did in introducing the Vedalia cardinalis. In the meantime we must continue to administer homeopathic doses of arsenic in our own behalf.

Paris green is the most popular remedy to use against the codling moth and it requires a pure article to do the work well. This is not always put on the market and orchardists should take particular pains to obtain only that which is pure. A good test is to place some on a smooth piece of glass, holding it at an angle and tapping it so that the powder will work slowly to the lower edge. If a white powder is left on the glass, it indicates that it is adulterated to that extent. Another test is to place a tablespoonful in a half pint of ammonia. If there is a sediment left after stirring it for a few minutes, it shows that it is adulterated.

White arsenic is much cheaper than Paris green and just as effective. It is more dangerous to use, owing to its similarity in appearance to baking powder or flour for which it may easily be mistaken.

"It may be prepared in the following manner: In two gallons of water, place two pounds of freshly slacked lime and one pound of arsenic. Boil from one-half to three-quarters of an hour. By this time the arsenic will have dissolved and united with the lime. When wanted for spraying, dilute with water and lime. The above arsenic will suffice for four hundred gallons of water. In order to prevent burning the foliage, slack one pound of lime to every twenty gallons of water used in diluting. This is for apple and pear trees."—Michigan Bulletin.

Paris green is used one pound to 200 gallons of water. If a couple of quarts of paste are used to a barrel of spray, the Paris green will be held in suspension a much longer time than otherwise and will not require constant stirring as is the case when using Paris green alone. By adding one quart of strong ammonia ot each pound of Paris green before putting it in the water, it will be dissolved and will remain a perfect mixture without settling. This, however, renders the Paris green soluble in water and will be washed off by rains. The undissolved article with the paste added will stick through considerable rain.

The codling moth lays its eggs on all parts of the foliage and fruit of the apple and pear trees and seems to bear the reputation of preferring the blossom end and a thorough wetting of every part of the foliage and fruit is the only way to combat the pest with sprays. It will require a spray pump with enough force to make a fine mist. This cannot be done with a cheap pump. The best results are obtained when the spray is left on the tree and fruit in the form of dew and not in such quantities as to run off of the foliage. More material will remain on the tree in the form of dew than any other form.

The first spraying should be done before the calyx closes, as after it will keep the spray from entering. A nozzle with a right angle is necessary to do good work as the spray must be sent down from above with force and should not be allowed to drop as mist.

THE ELBERTA PEACH.

It was down in that wonderful fruit section of Georgia where this great peach originated, in Houston county, just three miles east of Marshallville, on the farm of Hon. Samuel Rumph. This tree came up as a "black sheep" from the seed of the old Chinese cling. This, we all know, was a very large, white, clingstone peach, and the Elberta came, a very large, yellow, free stone peach. Its growth is very thrifty and rather stocky; it is hardy and stands spring frost well; the blossoms are evenly distributed over the tree and are closed bell shape. You can readily distinguish it while small from the other varieties as it is larger and has an ablong shape. This peach was named after the wife of Hon. Samuel Rumph.

YOUR BARN
will be as well protected as your dwelling house, and your dwelling house better protected than most buildings whose roofs have cost much more trouble and expense to lay, if you cover your buildings with

Rex Flintkote Roofing

Tin rusts, shingles dry and blow off, tar roofs sag and run, both burn at the touch of a spark,

Rex Flintkote is good fire insurance because it is spark-proof. It affords perfect protection in all kinds of weather, hot or cold, wet or dry, because it is pure, long-fibre, wool-felt, saturated with an acid, alkali, water-proof material, both sides coated with a water-proof and fire-resisting compound. Any ordinary laborer can lay it as easily as a carpet.

SEND FOR FREE SAMPLES

With samples you get a book, giving valuable suggestions concerning roofing, showing photographs of Rex Flintkote buildings of all kinds, from poultry houses to railroad terminals, which are to-day proving our claims for Rex Flintkote. *Beware* of imitations. "Look ☞ for the Boy" on every roll. Don't take cheap goods just because they are cheap in price. Write for dealer's name.

Practical Farm Science

BY PROF. A. J. COOK

SUGAR BEETS.

Today I have spent much of my time in the beet fields in this famous old German town of Magdeburg, famous, for here Luther preached, and it was my pleasure to look into his old church. This city, about the size of Milwaukee, is about two hours by car southwest of Berlin. This is the great center of beet culture and sugar production for Germany and is no less famous for its work of beet-seed breeding and production.

For over half a century there has been an effort carried on in the manner that the Germans do all such work—with marvelous thoroughness. The aim from the first has been to develop beet seed that shall increase not only the tonnage of beets but also the percent of sugar. They have done what the Illinois farmers have done in breeding corn. That success has crowned their efforts is shown in the fact that when the work commenced the sugar content was only thirteen per cent. It has steadily increased till it reached sixteen, seventeen and in 1905, eighteen per cent. The principle of selection is on form of beet—that with long tap root is regarded as best—and the actual percentage of sugar, as shown by actual test made by polariscope. That we in America are interested, is shown from the following figures, which I have from our United States consul at Magdeburg, Hon. Frank S. Hannah, to whom I am greatly indebted for generous aid and kindly courtesy: Germany exported from this consular district of Saxony in the last fiscal year, from July 1, 1904 to July 1, 1905, beet seed to the value of $310,295.80 and in the calendar year of 1905 to the value of $492,511.50. These figures are indeed startling and exceedingly suggestive. Why may we not keep all this money in our own national pocket book? Although distinguished scientific experts in this field of research express to me the opinion that our climate will not permit successful seed production, I must confess I am exceedingly skeptical. We know that California produces beets with a very high percentage of sugar. I shall cherish the belief until actual test shows to the contrary, that we have equally superior facilities and conditions to develop superior seed. I hope and expect to see the day when California will not only produce its own beet seed, but will reciprocate and supply our German brothers.

I have today had a very interesting interview with the man who is the head of the largest beet farm in Germany, that of Kleins-Wansleben, Herr Schraube. This gentleman is conversant with all the details of field work and from him I gleaned very important facts which emphasize what I have before given to the readers of the Cultivator.

It will surprise many to learn that here they plant in rows only twelve inches apart, and when they thin leave the beets at an equal distance in the rows. They claim that this close planting not only gives more beets, but also increases the percentage of sugar. It is to be said, however, that there are very few vacancies in the rows. As Mr. Schraube remarked, they can afford no breaks. Last year was a phenomenal and an exceptional one, with just the right amount of water and cool favorable nights. They harvested, I am told, twenty tons to the acre with a sugar percentage of eighteen. They plant from the middle of April to the middle of May. The present season has been peculiarly balmy and I found that nearly all the beets were planted. They find it so much better to plow for beets in the fall that this has become the almost universal practice. They also plow very deep, usually about twelve inches. The soil however, in this region is very light, and it is possible that this matter of depth would need to be modified in case of heavier soils. They grow beets only one year in four, though some of the farmers put in a beet crop every third year. They plant in the intervening years either potatoes, grass or one of the cereals. While they use no stable fertilizer on the beet ground, they do use it liberally the other years with the grain crops. They do, however, use, invariably, commercial fertilizers, and find that it pays excedingly well to do so. They use fifty or more pounds of soda nitrate per acre and double this amount of lime phosphate in form of treated bone meal. Others use much more of this commercial fertilizer. They plant on this large beet farm twenty-five pounds of seed to the acre. Many beet growers plant more but they see no advantage in so doing. All the cultivating after planting is done by hand, and no weeds are permitted to grow. At first this culture is shallow but as the season advances they hoe deeper even to a depth of six inches. As before stated the beets are thinned to one foot and almost no vacancies are ever seen. This persistent and thorough cultivation they hold to be a sine qua non to the best success. As hand labor here is so very cheap it pays to use human in lieu of horse labor, Indeed, in such close planting it would seem impossible to use horse labor, though a trial might prove it otherwise. Most of this labor is done by women. I was told that they grow about twenty-five thousand beets to the "morgen," or two and one half acres.

* * *

VALUABLE OBJECT LESSON.

Berlin, always beautiful, is now superbly attractive owing to the grand avenues of trees distributed liberally throughout the city. This in addition to the grand and numerous parks makes one glad to be a resident of this beautiful city. Not only are there many trees, but there is only one kind along each street. This surely gives a most pleasing effect. Again, many of these trees are famous for honey. For example, there are many streets with the honey locust, which, I am told, ranks first among the European trees for honey. Others, with European linden and still others with maple. No wonder that bees do well even in the cities of Germany. They have ample forage of the best kind. I remember once hearing Mr. Braunton at one of our institutes recommending the bright red flowering Eucalyptus ficifolia as a street tree. I wondered then if this would not be too gaudy. I find now on more than one street in Berlin trees with as showy flowers, and they are certainly very imposing and exceedingly attractive.

Tools That "Handle" Easy

You want tools that give best service and longest wear. Finish is all right—but first, last, and all the time, you want strength, endurance, and proper balance for easiest and most effective use. There is just one way to get such tools—see that every hand implement you buy bears the name

KEEN KUTTER

E. C. SIMMONS KEEN KUTTER TRADE MARK

The Sign of QUALITY.

Take for example a Keen Kutter fork. Test it any way you choose it's the best—tines and tang are drawn and forged from solid crucible steel *without a weld*, spring-tempered in oil, and individually tested.

All Keen Kutter Tools—Forks, Hoes, Shovels, Garden-trowels, Grass-shears, Rakes, Manure-hooks, Axes and a full line of Carpenter Tools—stand the *hardest tests*, and are easier to handle than any other tools.

Every Keen Kutter farm tool has a well-seasoned, straight-grained ash handle. If your dealer does not have them, write us. Tool Book Free.

A USE FOR UNMARKETABLE FRUITS.

The passage of the Payne bill, providing for the use, free of internal revenue tax, of domestic alcohol, rendered unfit for use as a beverage, and which goes into effect June 1st, 1907, promises to open a wide field for the California fruit grower. At the present time there are large quantities of inferior grade raisins and prunes, which if marketed at all are sold for a price so low as to be unremunerative to the grower, and which, under the new law, can be converted into alcohol at a fair profit. When in seasons of large crops and poor markets, which have hitherto meant heavy loss to our growers. as they had no other manner of disposing of their fruits, the unsaleable fruit can be made into an article of commerce which will at least leave some profit to the grower. In past years the great question has been what we should do with our unsaleable fruits in season of depression. Prunes and raisins have been fed to stock and hogs and in some cases manufactured into brandy, but the latter process did not pay for the reason that its manufacture was surrounded with so many legalities that growers hesitated to resort to it, while the heavy revenue tax on the finished product made it almost prohibitive. There is no question but that the passage of this act will be of very material benefit to the fruit growers of our State.

* * *

DISTRIBUTING PARASITES FROM THEIR NATURAL HOME.

The new insectary of the Horticultural Commission is now fairly established in Sacramento, and the parasitic insects are doing well. A very large part of these were lost in the San Francisco wreck, but enough have been saved for a fresh start and with the improved conditions in their new home they are doing well, and it is hoped that in a short time they will be numerous as ever. The Comys fusca, the internal parasite of the brown apricot scale, is now breeding out in large quantities, and hundreds of colonies of this insect have been sent out into infected sections during the past week.

* * *

CONTINUING THE PEAR BLIGHT WORK.

The work of fighting the pear blight is being continued in the infested sections of the Sacramento Valley, although the more active operations were suspended some weeks since. The principal work now is in cutting out new cases where they show themselves. Prof. Waite writes us that he will be in California again probably in August, and arrange for another winter's campaign against this disease.

* * *

HEAVY DAMAGE TO CHERRIES.

The heavy unseasonal rains this year have done much damage to the fruit crop, especially to cherries and peaches. The black cherries suffered the most, the Tartarians were almost a total loss. The cherry was the one fruit crop which promised especially well early in the season, but the rains caught it in the most vulnerable season and ruined the hopes of the growers for a big crop. Prices for this fruit have gone soaring, and in the center of the cherry district cherries are retailing at two pounds for a quarter.

* * *

HEAVY PLANTING OF PEACHES.

The peach seems to be the coming fruit both in California and the East. I notice from Eastern exchanges that in Northern Texas, Georgia, Missouri, Indiana, and other States enormous areas are being set out to peaches, while in California for the past three years the peach has most decidedly grown in favor. and during that time more of this fruit has been planted than any other. This season the demand for peach stock was so large that our local nurserymen were unable to fill it, and already heavy orders for peach stock are placed for next spring.

* * *

PRUNE PRICES FIXED.

The Santa Clara Valley prune crop is reported as light again this season, and the output will fall much below the usual average. This, together with the shortage of carry-over stock and of drying fruits has given the growers hopes for better prices this year. A meeting of the growers, or a number of them, was recently held for the purpose of considering the prospects for the season, and it was decided to place the basic price at 3½ cents for the four sizes. Other sections of the State report a fair to good prune crop, but in view of the fact that there is now a shortage in the dried fruit stock and an active demand, there should be no difficulty in the prune growers opening the market on the basis agreed upon, which is very reasonable.

* * *

HELP FOR THE FRUIT GROWERS.

There should be no scarcity of help in the orchard and field this season. The destruction of San Francisco has dispersed tens of thousands of its population to different parts of the State, and of these a great part have found their way into the country. Most of these will be glad to obtain employment in the orchards to tide them over until they can resume their usual vocations, so that the annual outcry about lack of help will not probably be heard this season. It will be a good thing for these people to get employment for it will go far toward tiding them over their period of adversity. Already we hear of numbers of San Francisco sufferers who have taken kindly to orchard work and their number will increase with the increasing demand.

* * *

FRESH FRUIT SHIPMENTS LIGHT.

Shipments of fresh deciduous fruit from the northern counties have so far been light, falling below the normal up to the present time. The principal part of the shipments have been cherries, and the recent heavy rains put a stop to this shipment to a great extent, as a large part of the ripe fruit was damaged. Apricots are now coming in but the crop of this fruit is very light, so that we can not look for heavy shipments until later in the season when plums, peaches and pears begin to go forward. The heaviest shipments of fruit this year will be grapes, late in the season. There is every promise of a good crop of grapes. and very large areas of new vineyards are coming in. There has been a great deal done in the way of vineyard planting during the past four years, especially of table grapes, and the output of this fruit should very materially increase now with each season.

* * *

HAS FAITH IN PEARS.

Howard Reed, a prominent pear grower of the Sacramento Valley, evdently has abounding faith in the control of the pear blight. He has not only taken care in cutting out the blight from his own trees, but has leased several large pear orchards for a term of five years, with the firm belief that he can control the blight and make his venture a profitable one. This demonstration of faith on the part of a practical man like Mr. Reed is worth more than all the theories that can be advanced. Mr. Reed knows of the work of eradication that has been done, and evidently has full faith in its efficiency.

SEEDLESS BERRIES.

We have heard of many so-called seedless berries and have seen a few. Several subscribers have sent in fruit from what was claimed to be the "Seedless Blackberry." Others, whose word is perfectly good, have stated that berries bought under the above name have been fairly congested with seeds. Two dealers who have advertised in the Cultivator, have written disappointed buyers that they are not seedless the first year, but become so the second. So far as tried, this has proved untrue and we fully believe that all so-called "seedless blackberries" are anything but seedless. Until we have proof of the genuineness of such claims the Cultivator will not hereafter print any advertisement of such stock.

RENOVATING SOILS.

To build up and maintain fertility in the soil, feed a large part of the crops and return the manure to the land. If manure is not available, plow under crops grown for the purpose. Plow deep (but do not subsoil). Grow leguminous crops for the nitrogen they add to the soil.

Commercial fertilizers and lime may be important means of improving the soil, but the fertilizer requirements of different soils and different crops in different seasons are so little understood that we are not yet in a position to make positive recommendations that are of general application.

WHAT NODULES DO.

From the results of various experiments and observations at the Michigan experiment station it is concluded that, while nodules on the roots of soy beans and cowpeas on fairly fertile soil may not noticeably increase the yield, they may increase to an important extent the relative and absolute amounts of nitrogen in the plants and thus add to their value as green manures and as food.

The Pomona Fruit Growers' Association, having discontiued fruit drying, have on hand 9000 drying trays, 500 picking boxes, and two graders which can be had at a great bargain by addressing R. D. Russell, corner Phillips and Ellen Sts., Pomona, Cal.

A1 Valencia Late Orange Trees

Owing to an unprecedented demand for Valencia Late Orange Trees during the present season, the market has been nearly exhausted, with the result that many have been unable to plant for want of good nursery trees. In the face of this situation one of our heavy contract buyers at the eleventh hour changed his order from Valencias to Navels, which put us in possession of a large block of one-year-old buds of prime quality and ready for immediate delivery. This stock is first-class in every particular and will be sold at once, as the demand for Valencias exeeeds present supply. **If you are in want of Valencia Late Orange Trees it will be to your interest to correspond with us at once in relation to this stock. First come, first served; write today.**

San Dimas Citrus Nurseries **San Dimas, Cal.**

With the Citrus Growers

BY J. W. MILLS

PRUNING ORANGE TREES.

Now is the time when bearing orange trees should receive what pruning they may require. We refer to Navel orchards, which in most cases are now picked clean. A one-time prominent orange grower but who now is engaged in building houses on sand, used to say at citrus growers' meetings. "When ever the passion comes over you to prune your Washington Navel trees, go away from home till the passion leaves you." That was good advice if the passion was to prune them after the plan laid down by deciduous fruit growers, but when the proper idea is conceived it is very poor advice. Opening up a tree so that it is goblet shaped is not pruning, but the removal of such interior brush that is past usefulness is good orange pruner's work. Branches that are trailing on the ground or whose fruit will be borne to the ground when loaded, should be cut back so that all fruit will clear the ground, for the great part of such fruit will never make good fruit. It will lie in the mud during the rains and be bruised more or less during wind storms.

It is no easy matter for a novice to pick out the branches which are past usefulness, for few of such branches are entirely without some healthy looking wood and even leaves. There may be a lot of dead twigs on the inside of the tree, but the tips usually find their way out to the open. Thinning these out so that the overlapping clusters of leaves on the outside of the tree will not shut out the sunlight is the essential point to keep in mind when pruning the orange. Of course all the dead wood should be removed. This will be a big part of the first pruning if the work has been put off till the trees are ten or fifteen years old. After the first pruning there will be some dead wood to remove from year to year, but there should be very little if the regular annual pruning is faithfully followed.

It is only by getting in and doing the work that the "hang" of the work can be had. A person may figure out and tell how to do it, but in order to do that he must suppose an ideal case to fit his imaginations and when the grower goes into the orchard to put these ideas into practice he can't find a tree to exactly fit the case and where is he? Up a stump or up against a tree? It makes no difference how long a man has been a pruner of any kind of fruit trees, the first few trees that he prunes at the beginning of the season occasion more thought and difficult work than all the pruning that follows. He will almost invariably go back and prune his first trees over again. In pruning the orange tree, the pruner must keep in mind that he wants to get light into the interior of the tree, but not so much so that it will turn the fruits a light color or allow a person to see through the tree from a distance. That would be butchering. not pruning. There is a happy medium that will permit the blossom to grow and the fruit to set on the interior of the trees without producing light colored fruit. Every grower knows that the best and highest colored oranges grow on the shadiest portions of the trees. No two trees are just alike and consequently cannot be pruned alike. This forces a man to work out the problem for himself.

Mr. C. C. Chapman of Fullerton has worked the problem out to a nicety and gets practical results that count in dollars and cents.

The topping back of an orange tree is simple in comparison with the other part of the work. It should consist of removing any branches that project high above the main body of the top or out at the sides of a tree. This will sometimes be most advantageously trimmed by removing the branch clear back to the trunk or to a larger branch. More often it should be cut out at a fork. Never cut so as to leave a blunt stub.

It has been demonstrated by several of our best growers that when young orange trees, especially Valencias. send out rank and heavy growth, the trees are much strengthened and relieved of future propping by cutting back the longest and strongest shoots to one of more moderate growth. This improves the shape of the tree and makes it stockier. Trees treated so will not be so large at the end of a given time, but they will hold up a larger load of fruit than trees which have been allowed to go unpruned.

Riverside has navel oranges 16 inches in circumference and grape fruit at 20.

GREEN MANURES.

The practice of plowing under green crops as manures is not very general, and we do not know as much as we should like to of the value of this method. Some crops do not thrive when sown on land into which a green crop has recently been plowed. This is particularly true of those crops that like a solid seed bed, or which are sensitive to acids. When a heavy green crop is plowed under, it goes through a fermentation not unlike that which occurs in a barrel of kraut, resulting in the formation of a considerable amount of acid.

Alfalfa is particularly sensitive to acids, and it also requires a compact seed bed. It is unwise, therefore, to green-manure the land just before seeding to alfalfa. The cereals, particularly wheat and rye, do not do well after a green manure. On the other hand, potatoes and corn are not seriously injured by green manures. In fact potatoes are benefited by them, since the resulting acid condition of the soil prevents the development of potato scab.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

FLORAL SHOW ECHOES.

At the Los Angeles Floral Show in May we saw, for the first time, Burbank's Crimson California Poppy, and don't like it a little bit. It is far from crimson and isn't even a good pink. It will never prove a garden favorite.

His Shasta Daisy was in evidence by hundreds, and made a fair show. For those who wish a large mass of white in the garden or a large coarse flower in the house, it is a good thing. It keeps splendidly, and if mixed with something " light and airy" either in foliage of flower sprays, would make a fair table decoration.

A new Marguerite, which "knocks the Shasta Daisy all hollow," as one visitor put it, is the Queen Alexandria, a half double form of the common white that is a prize winner whereever shown. Like the common one, it has a single row of petals, but around the center it has a finely cut row of about a half inch wide. It is twice as large as the common.

BEAUTY OF PLANTS.

The more fully the observer is familiar with the functions of plants and the structure and purpose of their leaves and flowers the more fully and completely will he apreciate and interpret their beauty and the refined sentiments they represent.

Plants are the missionaries of nature constantly at work attempting to cover some ugly scar which civilized man has made in his struggle to wrest from the earth the living which he claims she owes him. If you will but give nature the suggestion of your wishes in the form of a few choice seeds she will paint for you the rich shades of the pansy or the phlox; she will carpet your floor with a velvet rug of green and strew upon its surface in bold contrast the golden disks of the dandelion or the bright, saucy faces of the crocus. She will drape your walls with a festoon of green and hide therein rich gems of purple, of crimson, and of white, and, if you ask it, she will screen one apartment from another with barriers of green which may or may not carry bright floral gems.

CHRYSANTHEMUM RUST.

The chrysanthemum rust has invaded America within the last decade, and in various places has done injury to the chrysanthemum industry. The rust will grow only upon the true chrysanthemum (Chrysanthemum Indicum), and not upon daisies, costmary, or other allied species, or upon more distantly related plants. This rust appears to be a native of Japan, and has been introduced into Europe and America through commercial agencies.

In the western world the fungus produces only uredospores, which are efficient for spreading the disease under favorable conditions, but not for carrying it through uncongenial periods or for maintaining the fungus in full vigor. So long as teleutospores do not appear, the disease is likely to be easy of control, and at present none have been found outside of the orient. Care to keep out the disease, and handpicking with total destruction of badly diseased plants when it does appear, should be effective in wholly evading the disease or in eradicating it within a year or two. Spraying all plants of a lot frequently with Bordeaux mixture or sulfide of potassium will doubtless assist in keeping the disease in check.

USE OF PLANTS.

The appropriate use of trees, shrubs, vines and herbaceous plants in the adornment of city, village, suburban or country home grounds gives a charm and beauty which are interesting and pleasing to the passer-by and to the occupant of the home. Plants are a means of expressing restfulness and beauty. Their gradually changing aspect with the succession of the seasons heightens their pleasing effect and relieves the monotony. The changes which occur in the life of vegetation during the year have caused man to speak of the stages of human existence as the "spring," "summer," and "autumn" of life. The leaf, the branch, and the flower, as well as the general form of the plant, manifest a grace and beauty which art endeavors to copy. While art can not take the place of nature, it nevertheless plays an important part in teaching us to see and appreciate the beauties of nature. After the eye has been trained to see and the mind to interpret the beauties which the eye beholds, then association with nature produces its greatest effect.

SHADE TREES.

We, of today, enjoy an hour's idleness beneath the shade of some spreading tree and in this corner of the world, enjoy it none the less because the air is laden with the orange bloom's fragrance and the sleepy hum of insects as they fly from bloom to bloom.

We are apt to be ashamed of this in the busy struggle for existence of the 20th century; but it is as much a part of our nature today as it was many centuries ago, when the patriarchs sat beneath the shadow of their fig and vine, and no picture of the Garden of Eden would be complete unless supplied with some spreading trees under whose grateful and refreshing shade our first parents might take their noonday rest, and ornamental trees from whose symmetry and beauty they might take their first lessons in aesthetic art.

ODD PLANT LIFE.

The delighted plant-lover, entranced by the rich color, grace, delicacy and fragrance of this plant or the majestic grandeur of another may well feel that—for the moment at least—his cup of joy is full, but if he is so fortunate as to be in the way of acquiring a systematic knowledge of plants, an ever deepening interest is added to his pleasure. Systematic knowledge is to be understood, as relating to position in the vegetable world, or scientific classification. The "Natural System" which has universally superseded the arrangement of Linnaeus, aims in general terms to bring together plants having the greatest number of resemblances. Viewed in this light, botanical names become fraught with meaning—with an intelligence that constantly expands while gaining in precision in proportion to the advance in experience; a panorama is presented to the mind the details of which continually increase in interest and vividness.

Unsuspected resemblances between plants are often hidden by wide differences in their general appearance and from this follow the many curious surprises to be found by glancing at a list of the genera of any one family. Let us then take, at haphazard, a few of the common plants of garden or field and see what they will tell us of relatives seldom considered as such except by specialists.

Sitting in placid reflection, upon your rose-embowered veranda, the sky-line is broken by the sombre spires of the blue gums, bowing in majestic grace and haughty recognition to the gentle orange-scented breeze, as you gaze in contented mood, perhaps you would be startled into a belligerent denial if told that those trees, towering more than a hundred feet above the classic myrtle beside the house, were of the Myrtle family. Yet such is the case. In this instance, the features common to both plants are not easily recognized. They could be quickly determined by checking with the description limiting the family. The true myrtle referred to is not to be confused with the periwinkle, a creeping vine sometimes wrongly called "myrtle," but really a dogbane.

The claim is made that Eucalyptus amygdalina is the tallest tree in the world. Eucalyptus giganteus is apparently is not to be sneezed at, it is reported to attain 400 feet in height and 100 feet girth. (Ketchum, Bot. of Academies and Colleges, p. 100, as to E. giganteus.) The pomegranate, formerly placed in the myrtle family, is now classed with the crepe myrtle in the Loosestrife family. There is not I believe, any member of the Myrtle family indigenous to the United States. Other plants of this family are the rose apple, the guavas, the bottle-brushes, and the Brazil nut tree (Bertholletia excelsa.) What we know as the Brazil nut is the seed, of which 18 to 24 are inclosed in a round shell opening by a pore at the top; the shell is half of an inch thick and so hard that an ax is required to break it.

An amazing range is found in the limitations of families from the Hornworts, comprising one genus of only one species, to the Daisy or Sunflower family embracing, approximately, 766 genera and 9800 species. So large a group of plants admits of wide variation in appearance, and it is hardly to be expected that the common and detested cocklebur should be recognized as allied to the daisies and sunflowers.—L. A. G.

SHADE TREES and EUCALYPTI

Also a fine variety of Eastern trees, such as Lindens, Maples, Horse Chestnuts, White Elms, etc., all well established in cans. Dracenas, Palms, Roses, Ferns, etc.

Malthoid Roofing

Malthoid Roofing is made from a compound that will not dry out—it will last for years against the hardest kind of climate, and always keep the interior of your buildings dry and comfortable.

Malthoid is finished when laid and does not require painting. It is inexpensive; a large surface can be covered quickly. It does not warp, shrink, crack, blister, flake off, run or deteriorate in any way. Send for booklets.

In the Vegetable Garden

BY ERNEST BRAUNTON

LATE VEGETABLES.

All kinds of summer vegetables suitable for a warm climate can still be sown or planted. Melons can be planted early in July and come in fresh in the fall quite different from those that have been bearing all summer. Tomatoes, summer squash, corn, beans, etc., will be in perfection when cooler weather comes in the fall. It will be almost impossible to start those things without thorough irrigation and plowing. Under such conditions you can see them grow day by day.

SEEDS AND PLANTS.

The supply of seeds for the garden should be secured some time in advance of the planting season. During the winter months send for the catalogue of some seedsman in your part of the country and make a selection of the kinds and quantities of seeds that you desire to plant. Garden seeds can frequently be secured of some local dealer who handles them in conjunction with other goods. Many of the garden seeds lose their vitality after one year's time, and old seeds should, as a rule, not be relied upon.

Throughout the colder sections it is desirable to start plants of certain crops before the danger of frost is past. The simplest method of starting a limited number of early plants is by means of a shallow box placed in the south window of the dwelling. After the plants appear, the box should be turned each day to prevent the plants drawing toward the light.

THE CHAYOTE.

The chayote is a climbing vine belonging to the Cucurbitaceae or gourd family, but to a section different from that which includes the squashes, melons, cucumbers, and other related plants in general cultivation. The fruit of the chayote contains a single, short-lived seed, and it is probably owing to this fact that it is not so well known as its relatives in tropical and semi-tropical countries.

The introduction of a superior variety of a plant already in cultivation is no longer attended with any special difficulty or delay, but new plants are still popularized with extreme slowness until they reach the point of commercial importance. Particularly is this the case when, as with the chayote, the seed can not be kept in stock or handled in large quantities by dealers, who have thus small incentive to advertise or make other special efforts to bring the new plant before the public.

The culture of the chayote is extremely easy when once a beginning has been made, and its desirable qualities are such that in spite of the obstacle of a difficult seed supply it has gradually made its way from Mexico through tropical America to Brazil, and is also known at many points in the Old World, from Spain and Algeria to the East Indies and Australia. But this extension of distribution is in many cases of recent date, and the value of the plant is still very imperfectly realized, even among intelligent agriculturists of regions where it is not unknown. In addition to the fruits, which are considered an excellent substitute for the summer squash or the vegetable marrow, though very different from either, the climbing vine is of use as an ornament for covering fences and arbors, the numerous flowers are rich in honey, and the large tuberous perennial roots are charged with starch and furnish a wholesome food material comparable to the true yam.

SPINACH.

Spinach thrives in a rather cool climate and attains its best development in the Middle South, where it can be grown in the open ground during the winter. Large areas of spinach are grown near Norfolk, Va., cuttings being made at any time during the winter when the fields are not frozen or covered with snow. When the weather moderates in the early spring, the plants make a new growth, and a large crop of early greens is available.

Sow the seeds of spinach in drills 1 foot apart at the rate of 1 ounce to 100 feet of row, or 10 to 12 pounds to the acre. To produce good spinach, a rich loam which will give the plants a quick growth is required. As ordinarily grown, spinach occupies the land during the autumn and winter only and does not interfere with summer cultivation.

Spinach is an easily grown garden crop, and there is, perhaps, no other of its kind that will give as good satisfaction. Three or four ounces of seed, planted in the autumn after a summer crop has been harvested from the land, will produce an abundance of greens for the average family during the late autumn and early spring. In gathering spinach the entire plant is removed rather than merely cutting off the leaves. The larger plants are selected first, and the smaller or later ones are thus given room to develop. No thinning is required if this plan of harvesting is practiced.

GARDEN BEANS.

If the crop is planted for string beans the rows are made about two feet apart, and the hills about six inches apart in the row. From one to four plants are allowed to grow in a hill; depending on the strength of the soil. The hills are planted farther apart if the variety is one of the larger bush beans. It should be the aim in planting to get the row as narrow as possible; it is better to drop a bean every inch than to drop six beans every six inches, provided it can be accomplished as easily. When the rows are straight and very narrow it often happens that there is no occasion to use the hoe at all. Excellent crops of beans are grown without taking a hoe into the field at all.

Vegetable growers having only a few acres will doubtless find it cheaper to have fertilizers mixed at the factory, but those who cultivate large areas of one kind of vegetable should be able to save the profit that the manufacturer makes on mixing the fertilizer.

SURE SEAL,

Home canning of vegetables, meat and fruit made easy and certain by The Economy Jar

To give you an idea how easy it is to can fruits, soups, vegetables, meats, etc., in the Economy way—Note the wide mouth—how easy it is to put your hand in and thoroughly clean the jar. No rough seams inside or out to catch lint, chip into food or scratch you. After pouring the contents in hot and wiping rim of jar, clap on the gold-lacquered cap (acid-proof.) No screwing, twisting or prying. Just press the cap on gently. No bruises, burns, cuts or sprains when you use the Economy. Put clamp on top to hold cap in position while contents are cooling. The cooling forms a vacuum and holds cap on firmly. Jar is then absolutely airtight. Next day remove clamp, which lifts off lightly. If the food was cooked enough cap is held tight by vacuum, and contents cannot spoil, as no air can leak in. If cap loosens, contents were not cooked enough to sterilize, and can be heated again and saved. The Economy automatically informs you if contents are in proper condition to put away. When ready to use, puncture cap with can opener and pry off lightly. No sprained wrists, no unscrewing, no hands gashed by broken glass. No glass particles in food; no smelly top; contents fresh and sweet as the day you put them up. No separate rubber rings required. The Economy is the jar you will use with comfort and satisfaction year after year. There is absolutely no jar that looks like, works like, keeps like, seals like, or opens like the Economy. Using some other jar *cannot* give you any notion of what the Economy really is and what it really will do. Try the Economy for yourself. Ask your dealer for it. Send his name and we will send you, free, a booklet of recipes. Write direct to main office.

WIDE MOUTH

Alfalfa Ranch Wanted Have a customer for a nice alfalfa ranch and home. What have you? *White & Newby,* 404 Hellman Bldg, Los Angeles, Cal.

Alfalfa and Fruit Land

To the Homeseeker. It will pay you to investigate our land in the Gridley Colonies, Butte, Co., California. We offer irrigated land as good as any in California at $50. to $100. per acre with a fully paid water right. Water costs only One Dollar per acre a year. We build the ditch to your land.

Anything that will grow in California can be produced on our land. Soil is a sedimentary loam, very deep and free from alkali. This is the land that grows the Big Oaks. No better land anywhere.

Alfalfa and Dairying, peaches, grapes, English Walnuts and figs pay the best Big fruit cannery, also a fruit drying plant at Gridley. New Electric Railway now building.

Good schools, churches, etc; good roads. A prosperous community, with a bright future.

Write for free printed matter.

Chas. F. O'Brien, Gen. Mgr.
30 Montgomery Street
San Francisco, Cal.

Apple Orchards

We have placed on the market five-acre apple orchards (two-year old trees) with crop of corn planted between, at the small sum of **$1,150,** that will double in value in five years and treble in ten years, besides making interest on your investment during the growth of trees. The land is all right and trees are beauties, situated right in the apple center and only 3½ miles from the prosperous city of Watsonville, the largest apple growing section west of the Missouri river. Land level and oiled roads from city to the ranch. These tracts can be bought for $250.00 down and $15.00 per month, or on terms to suit you. This is a grand opportunity to own an apple orchard and chicken ranch. ***Investigate Now.*** You can have larger tracts if desired on same terms.

Our State Agricultural Society.—The directors of the California State Agricultural Society have determined to put forth every effort possible for reviving interest in the institution, enlarging its field of operations and increasing its usefulness to the great industry for which it stands. This is a big State with varied interests, but it is the hope and purpose of the present board of directors to extend the work and benefits of the society to the remotest parts of California and to all the industries that are comprehended by the word Agriculture in its broadest sense. In this endeavor they ask the co-operation of the press and the people. They realize that such co-operation is essential to success—to the creation of a sentiment that will make their work effective.

It is the desire of the directors that the secretary shall reach out for the best that is being done in this State, and in this country, and in other countries in industrial lines, and give the information thus obtained to the people in periodical bulletins.

It is the aim to get in closer touch with the Agricultural Department of our State University, with the Agricultural Department at Washington, with the Experiment Stations of the Federal Government, with other State agricultural societies, and with Consular reports that have relation to our interests, and keep our people advised of the latest and best that is being done in the world in those particular industries that most concern them. In short, the intention is to extend the work of the institution along all lines of endeavor in which it may be of service to the people of California within the limits of the great field comprehended by its name.

The work immediately in hand is the preparation for the Fair of 1906, which is scheduled to open on the 25th day of next August. In harmony with the general purpose to improve all features of the Society's work, it is the determination of the directors to make this the biggest, best, most attractive and most comprehensive display of livestock interests and other industrial resources ever assembled in California. The aim will be to secure all products of the State from every part of the State, and present them in a manner that will not only be attractive, but a source of instruction to every one seeking a broader knowledge of California's possibilities. With proper encouragement to reinforce the high aim of the directors, the State Fair can be made the greatest annual event in California, and the society one of the strongest instrumentalities for the development on higher lines of the State's agricultural and other industrial resources.

* * *

International Institute of Agriculture.—It is gratifying to learn that we are to have a great International Institute of Agriculture as a permanent institution. The King of Italy, who has been foremost in the work, after consultation with men of prominence in many countries, issued a call for a meet at some future time, and it is stated that thirty nations, including our own, have notified the Italian government of adherence to its proposals, in so far as to promise representation at the conference.

It is proposed to limit the main functions to the collecting, summarizing and disseminating of correct and timely information, and in a form in which it can be easily availed of. This information is to consist of the available quantity on hand and the condition of the growing crops of any and all the various staples of agriculture. Such data will include information respecting crops, labor, prices, freights, discoveries, inventions and markets.

The importance of this step will be manifest when it is considered that the world summary of any one agricultural staple forms the basis of the price; in other words, the world's price of the staples of agriculture is arrived at by a summary of the stock on hand and the conditions of the growing crops. At the present time these facts are gathered by only a few of the governments of the world, necessarily involving more or less speculation as to the conditions in those producing countries where no such information is gathered or disseminated.

Mr. David Lubin, of California, who has been laboring for years to interest the nations, especially Italy and the United States has this to say of the proposed organization:

"The institute, it is calculated, will do for the staples of agriculture, the things of exchange, what the gold standard has done for the money value, the medium of exchange. It will steady the staples of agriculture and largely replace the speculative field, rendering the prices of staples more stable than they can be under present conditions. The case, substantially, is this: So long as rumors largely make up the world's summary, so long are the staples rendered highly speculative, and so long as this is the case, just so long must there be a persistency in the adverse conditions of the capital and labor of the farm and the capital and labor of the factory.

"Again: Were it even possible for any one nation to introduce efficient methods in foreign countries and produce accurate world's summaries, it would even then be of no value, for the selling nation of the staples is necessarily a bull and the buying nation a bear. Were the selling nation to produce the correct figures they would be disputed by the buying nation, and so on. It would only be acceptable were each of the nations of the world to gather the information and summarize it and that each of the various statements were to tally. This is manifestly an absolute impossibility. It therefore follows, and necessarily so, that all of the nations should combine for the purpose of gathering, summarizing and disseminating the world's information and this is the purpose of the International Institute of Agriculture."

* * *

"Please Re-print.—Every week the Cultivator receives a number of requests like the following:

Editor Cultivator: Sometime ago you published in your paper an article on the gopher. Can you forward me the number or give a reprint of it. I missed seeing it and I am anxious to get it.—C. J. B."

Of course we cannot remember all that we print. To keep back numbers of the paper world require a warehouse. To reprint such articles would crowd out others of value to many readers and would only aid the enquirer. Subscribers should either keep a file of the Cultivator or cut out such articles as are of special interest to them. In the case above cited the subscriber evidently missed what to him was a valuable article, through a careless perusal of the paper. In this progressive age we must go forward, ever presenting something new, and cannot re-hash unless an article is of unquestioned value to a large umber of readers and has not been published during the past twelve months. We are often criticized for re-prints by readers who have no interest in the matter reproduced and who feel aggrieved at again being confronted with it.

The Cultivator has the largest and most able corps of paid writers of any agricultural paper west of the Mississippi and it really seems that interested readers might, with profit, preserve a file of the Cultivator for future reference.

* * *

Santa Ana Plant Garden.—The Bureau of **Plant Industry has decided** to abandon the Plant Experimental Station at Santa Ana, and Prof. N. B. Pierce is now engaged in removing all of value that belongs to the government, with the idea of continuing the station for himself along commercial lines. With this end in view, he severs his connection with the Bureau on June 30th.

The abandonment of this garden will cause deep regret in the minds of all plant lovers for some truly wonderful work in hybridization and plant breeding was well under way and the next few years would have marked the introduction of many new and valued plants, specially adapted to our soils and climate. But a few months ago the writer thoroughly inspected the experiments under way and is much surprised to find that all the past years work is to come to naught, so far as Uncle Sam is concerned. Prof. Pierce has done noble service since his residence in Santa Ana and we sincerely hope he will prosper in all that he undertakes.

* * *

Necessity for Economy.—The scarcity of water during summer, in many sections, should set people to thinking and devising methods whereby a recurrence of this state of things would not happen. There are hundreds of canyons in our mountains where the winter rains cause good sized torrents to rush down which, on reaching the valleys below, cause great destruction. It appears to us that if storage reservoirs were constructed, which could in very many instances be done at comparatively nominal cost, the greater part of this water could be stored and in extremely dry seasons used for irrigating. The mountain water which is now piped could be used for domestic purposes and this stored water would help tide over a dry season in good shape. Water should be conducted from all reservoirs in pipes, not open ditches, and every possible means taken to prevent loss by seepage and evaporation.

* * *

Our Beautiful State. Many have been the complaints, among all classes, over the great amount of cloudy weather this spring has brought upon us .But the clouds and their attendant rains have wrought well for all our people. Comparatively few have been damaged by storm waters, and these few, in most cases but lightly. The compensation has come in an increased water supply, assurance of better late crops, and extended grazing season, and last but by no means least. the whole State looking fresh and green down into June, a most unusual condition. This most exemplary weather for general agricultural crops will fill our State, from Siskiyou to San Diego, with showers of golden coin. All hail the cloudy, rainy springtime! May its precipitation never never grow less.

FREE SEEDS.

The free distribution of Government seed might be narrowed down close to the vanishing point by a system of elimination. On every packet of seed sent out from Washington there is a printed request that the recipient will report to the Agricultural Department the luck that he has with the contents. The department clerks are never overworked after the harvest in tabulating such reports. So here's the plan:

Unless the farmer writes, "Dear Government, your Pride of the Can Corn was a wonder and one head of your Sure to Head lettuce headed,'" or words to that effect, put that farmer on the black list and ignore all future applications from him for free seed. His Congressman will be able to tell him that it is his own fault, and no harm will be done.

The plan will not be complicated by a new batch of applicants this year, for there are not going ot be any more farmers after the present generation dies out. All the sons of farmers are becoming motormen or bankers or drivers of ice wagons.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Grapes are ripe at Brawley.

The "June drop" of the orange is with us.

Warm weather is bringing out the codling moths.

Napa County reports 'best grape crop for 15 years."

Hail has damaged the apple crop in the hills above Porterville.

June lemons are at the highest price ever known for this month.

Navels are about gone, not over 50 cars remaining in the state.

The Sacramento pea crop will be a fourth heavier than last year.

A car of seedling oranges from Colton sold in the east for $1,748.

Prices of orange lands in the Porterville district are on the jump.

Grapes about Santa Rosa are bringing from $25 to $30 per ton.

Imperial reports seem to favor the more extensive planting of apricots.

Apricot pits are bringing $15 per ton this year for German shipment.

Anaheim walnut growers claim the crop will be double that of last year.

Downey reports a heavy crop of walnuts on the trees in that section.

Cherries about Geyserville are bringing from 4½ to 6 cents a pound.

Some Muscat grapes about Oleander were knocked off the vines by hail.

Apricots at Santa Paula are bringing $40 per ton green and 11½ cents dried.

A Riverside man has perfected and patented a machine for making orange boxes.

Apricots about Sacramento are a failure and peaches are but a little better.

Late rains have caused the vineyardist to give his soil an extra cultivation.

James Mills is planting seven miles of robusta palms on Arlington's streets.

Imperial Valley grapes promise a heavy crop. No mildew has appeared to date.

Six hundred dollars was offered last week for one acre of Malaga vines at Thermal.

Sol Edwards of Calexico has 1600 acres of fine grain under water and of course ruined.

About Vacaville the present years fruit shipments will fall way below those of last year.

The apple crop at Seven Oaks in San Bernardino county was entirely frozen by late frosts.

The severe rains of last week have seriously delayed fruit shipments at many important points.

While the Tulare County apricot crop is very light, in the Sultana district it is unusually heavy.

Buena Park, a corn growing section near Los Angeles, reports the finest crop outlook in many years.

The Tule River Citrus Association is a new one, to include the South Tule, Pleasant Valley, and Globe districts.

Cherry picking is in progress in the Yucaipe Valley, but the crop will be light by reason of damage from late frosts.

At the annual meeting of the Butte County Citrus Association, in Oroville, June 2nd, it was decided to build a packing house.

Shot-hole fungus seems to have damaged apricots but little this season in many sections but Hanford reports a heavy loss.

Up in Happy Valley, near Anderson, hail fell last week to the depth of three inches, completely stripping trees of fruit and foliage.

It is estimated that we have yet to forward 2000 cars of Valencias, 300 cars of Sweets, 100 cars of seedlings and about 150 cars of St. Michaels.

The Southern Pacific has put on an exclusive berry train between Salinas and San Francisco for the benefit of the berry growers in the Pajaro Valley who ship about 800 chests per day.

AGRICULTURE.

Watermelons are ripe on the desert.

Dixon reports "all crops are splendid."

Green Valley will have a heavy crop of hops.

Alamitos beet crop will be the "largest ever."

Chino has 10,500 acres of beets and Oxnard 16,000.

The potato moth is rather numerous around Salinas.

Brawley barley shipments average two cars a day.

Upland boasts of oats six feet and seven inches high.

Golden Heart is the leading celery in Orange County.

Winters is shipping large quantities of beans and squash.

Lemon will have a heavy acreage of tomatoes this season.

The Imperial Valley will market 400,000 sacks of barley.

Ventura district has about 45,000 acres of beans planted.

The Escondido Valley had a June rain, a rare occurance.

Olive farmers are all turning to portable pipes for irrigation.

The hay crop around Saticoy was damaged 75 per cent by rains.

Guernsey, in Kings County is becoming a beet growing district.

Springville in Tulare Coutny is becoming noted for its "praties."

Soledad region was benefitted rather than damaged by the late rains.

There is a labor famine in all hay and grain sections of this State.

The late rains will result in an increased beet acreage in all sections.

The rain damage to grain about Hollister is estimated at 15 per cent.

Corcoran farmers report plenty of rain, but no serious damage resulting.

Celery from the Smeltzer district was 2275 cars against 1800 last season.

Ventura County has been presented with a 300-acre park covered with fine trees.

Imperial Valley ranchers get twenty-five tons per acre of sorghum cane for feed.

Cut worms destroyed a few acres of beets at Alamitos [illegible] replanted.

Farmers in every county are complaining of too much cloudy weather this spring.

Desert towns are shipping onions, cucumbers, and squashes by car loads to the East.

Banning reports hundreds of acres of Texas red oats six feet high, with a heavy yield.

2575 tons or hay arrived in San Francisco last week and yet more is badly needed.

Hanford is bragging of oats over 8 feet tall and a half inch in diameter of stalk—Next!

Brawley shipped the first crate of Canteloupes May 28 and it sold in Los Angeles for $15.

The damage to the hay crop caused by the last rains seems to be confined to a discoloration.

Twenty-seven hundred cars of celery will be shipped from Smeltzer the coming season.

The Coachella Submarine has suspended publication until the editor gathers his melons.

The beet crop around Los Alamitos is in the very "cream" of condition, and promises fine.

Around Winters the farmers have just harvested the heaviest crop of hay for many years.

Fresnoites claim the Kearney estate is worth over a million dollars if put on the market today.

The grain harvest is on in the Imperial Valley with barley averaging 20 sacks to the acre. This will net the growers about $12 per acre.

Five thousand six hundred and ninety-six acres of celery will be planted around Smeltzer next year.

Around Redlands the army worms have been so bad that in one section the ranchers cut their alfalfa, let it dry, and burned it to kill the worms.

Salinas Valley expects to harves common barley, 50,000 tons; chevalier barley, 35,000 tons; oats. all kinds, 5000 tons.

Many thousands of acres of grain around Tulare were lost by overflow, no portion of them being of use when the waters went down.

LIVE STOCK.

Asparagus along the Sacramento River will be but half [illegible]

About 700 acres of spuds below Sacramento will yield a heavy crop.

A Hanford sheepraiser sold 1400 lambs for three dollars each last week.

San Jacinto has a new creamery under the able management of Dr. Graeff.

A train load of cattle, averaging 350 head, is shipped from Chino to Los Angeles every week.

Three thousand cattle from Utah are expected at Chino about June 15th to be fed on beet pulp.

Stock raisers declare that the recent investigation of packing houses will hurt their business.

The Colorado River has fallen over a foot in the last week and Imperial Valley farmers feel better.

San Jacinto bee keepers report an unusually heavy crop of honey, while most districts expect just the reverse.

J. C. Rice has sold to A. D. Owen of Fresno the registered Holstein Friesian cow Kaastra Daw's Abbess.

Wild horses are so numerous and destructive about Reno that ranchers have been given permission to kill them.

The Marysville wool growers held another auction on the 8th and sold about 500 bales, ranging from 18 to 24 cents.

It is estimated that the Neill-Reynolds report has damaged the live stock industry in the United States to the extent of $150,000,000.

Buena Park residents say that the poultry crop bids fair to become their principal harvest. Lucky the section which can reap every month in the year.

Stockmen from Marysville district who drove their cattle to the mountains early in the season have experienced heavy losses in the recent storms.

Beekeepers in the vicinity of Sacramento have organized for protection against the commission men who get most of the profits that should rightfully accrue to the apiarist.

Ten hundred and sixty mules, the largest shipment ever made from the United States, went out from Stockton last week for Guatamala to be placed at work in the "tented field."

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

RANCH FOR SALE—650 ACRES 90 MILES from San Francisco in fruitful coast valley, 3 miles from railway station, on southwest slope of mountains. Delightful climate; no malaria. Beautiful scenery. A summer resort for city folks. Summer board in demand. Fine fishing. Estimated fire wood, chiefly oak, 10,000 cords. When cleared there will be 200 acres of best apple and vine land and 40 acres orange land. Orange orchards in vicinity. At present 50 head of cattle carried the year round. Springs and ponds. Angora goat business profitable. Seven-room house, stable, small orchard, 10 cows, 2 horses, wagons, implements. A bargain at $11,000. Crops without irrigation. Address Hollywood, Cal., P. O. Box 55.

FOR SALE—OR EXCHANGE FOR TOWN or ranch near Los Angeles or north inland from coast, poultry and fruit ranch of 33 acres, shipping canning and drying fruits. All under cultivation and good improvements. Two hours' ride from San Francisco by cars, one mile from town. Address Box 64, Sonoma, Cal.

MONEY TO LOAN—I HAVE MONEY TO loan on real estate. If you do not want to borrow more than one third the value of your property you can have it at one per cent less than current rates. address Joy A. Winans, 4565 Pasadena Ave., Los Angeles, Cal.

REPRESENTATIVES WANTED IN every county to sell Parafelt Rings for Mason jars. The only absolutely sure and sanitary sealing ring made. Big money for hustlers. Write to T. S. Wilson, 1357 9th Ave., E. Oakland, Cal.

ARE YOU INTERESTED IN FRUIT CANing? We have a book free describing six sizes of canners for the ranch or small factory, ranging from $10 to $125. Send postal with address for it. W. S. Ritchie, Corona, Cal.

FOR SALE—A QUANTITY OF SECONDhand riveted steel water pipe suitable for gravity irrigation system or drainage, sizes 6, 8 and 10 inch. Address Joy A. Winans, 4565 Pasadena Ave., Los Angeles, Cal.

HEALTHFUL VEGETABLE COOKING oils, free from disease. Inexpensive From corn, cotton and olives. Tiny samples 1c each. Also honey and olives. Address W. S. Ritchie Corona, Cal.

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

MALTESE KITTENS—MALES $1.00, FEmales 75c. Miss Wood, 130 Carey St., Arroyo Drive, Pasadena, Cal.

FOR SALE—A FEW THOUSAND BLUE Gums, cheap to close out, Address L. Z. Huntington, Anaheim, Cal.

FOR SALE—FINE LAND WITH WATER, close in to Turlock. Address Owner, Box 32, Turlock, Cal.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

MOISTURE IN BUTTER.

The hand separator used by the farmer, has placed him in a more independent position in regard to the creamery. Before its introduction he was obliged to sell his milk to the nearby man, while with a separator of his own he has a cream heavy in butter fat that can be shipped to a creamery at a distance. If it arrives sweet it is used as cream, if sour it goes into the butter vats. The entire San Joaquin valley is at times shipping to Los Angeles or San Francisco, some of the creameries only churning the surplus into butter, depending on shipping the bulk of the cream away as cream. The natural result is a keen competition among the creameries and the price of butter fat soared away up, to meet this increased price of butter fat, the butter makers began to study to make the over run, or the difference between the amount of butter fat and the completed butter as great as possible, or by increasing the water contents.

It has been claimed that as high as twenty-five to thirty per cent of water was left in the butter, but that is to be accepted with much allowance, for so far, the samples analyzed have not shown so much in any submitted. The Ames Dairy School has given much time to the subject and a study of the carefully tabulated statements is to be recommended to any one that wishes to look deeply into the matter from the scientific standpoint.

The wages of a butter maker has in many districts come to depend on the amount of over run he can show to the manager, or owners of a creamery, so that a knowledge of this subject is well worth while for the milk producer, when by a little watchfulness it will enable him to see where the profits of a creamery is coming from. For, until we have some governing laws or inspection the temptation to make a lower test, or to weigh the cream light at the creamery crops up at every turn of the butter maker's life. Business policy! Yes; policy, a polite name for rank dishonesty. I wonder if people will ever be morally as well as legally honest! So it does not land a man in the pen it is all right to most of them.

The water is incorporated in the butter by churning at high temperature, or by washing the butter in warm water. The commission people, also, take a hand in reworking the poorer grades of butter in tepid water to increase the weight enough to pay for the cost of handling; so the selling of water for butter fat has become prevalent to a marked degree in the past year.

Congress instructed Secretary Wilson to set a standard for water in butter, thereby making excessive amounts illegal, and to have the revenue officers enforce the same, by examination of the output of the creameries. The standard set by Secretary Wilson is 82.5 per cent of butter fat, leaving 17.5 per cent for water, salt and curd. This law, like so many others in this country when of a paternal nature, has never been enforced. The past open winter in the Middle West has brought the matter into plain view, as the surplus butter, becoming a drug to the commission men, caused them to export butter. The London commission men received samples and ordered butter shipments. Now the English laws only permit 16 per cent of moisture and other contents than butter fat in butter. Carload after carload was "turned down" as having 18 to 23 per cent of water.

The New York Review claims that the excess of moisture injured the keeping qualities of the butter, producing a fishy flavor. The fact as proven by a long and exhaustive series of tests by the Ames Dairy School of Iowa is that the excess of moisture was not to blame for poor quality of butter. The creameries were using their best cream to make custom butter containing 15.5 per cent moisture. While in the bulk of the ill flavored bad cream they received, a second grade was being heavily loaded with water, to increase the weight enough to bring in money to pay for a larger amount, to offset the lower price per pound on account of inferiority. Under the existing conditions the creameries by paying a like amount of money for both good and bad cream are not making it any object for the producer to care for the cream, and by caring more to make a large amount rather than a high quality butter, the creameries were cutting into the careful producer as well as into the consumer's pocket. Again an instance where "Honesty would have been the best policy." Prof. McKay was sent abroad by the Department of Agriculture to study the question of butters in the old world. In London he found the French and Danish butters sold highest, these carried from sixteen to eighteen per cent of water.

The next season the Ames School started an experiment in which 55 creameries sent in tubs to be scored. These tubs were then shipped to New York and after two weeks were again scored as to water contents and general quality. These tests were made as complete as possible and continued long enough to cover the season. The records were carefully kept and elaborated into tables. The summing up on the moisture problem was as follows: The average water contents of the 222 samples was 12.73 per cent. The lowest scoring butter, that spoiled the quickest, had only 10.75 hundredths of water in it, while the highest scoring butter averaged 15.42 per cent of moisture. It has been further claimed that butter containing the highest amount of water had the most bacteria in it, or was not as wholesome as the drier butter. There seems to be considerable confusion in the minds of many people about bacteria. Now there are some, that are in much of our food, that are not injurious in any way, nor are they specially detrimental to the food itself. Then another class of them are beneficial, as the yeasts and ferments, another class are the dirt ones, that, while they are unpleasant to think of, in living out their life history produce disagreeable flavors. Another more limited class of germs, by breaking down the foods and by their life actions, convert the foods into ptomaines that are destructive to human health. Then there is another lot, that are introduced directly into the water by carelessness of sanitation, or by sewage contamination. These are partly animal and partly vegetable and are known as the pathogenic or disease germs. This last class it is said are found in the water in butter, but should it be so, it would only show that the butter had been washed in impure water and the difference between 18 per cent and 10 per cent of water would not be much if the water was contaminated. Sanitation of the creamery and boiling of the water used would be the remedies rather than using less water in the butter.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

Poor keeping butter comes from dirty, over-ripe cream and from dirty cans and improperly scalded churns; from dirty milkers and from general carelessness, rather than from the cows or from the water used.

World's Champion Cow

The Guernsey cow here illustrated has proven herself the biggest butter producer in the world. This letter tells the story.

"Milwaukee, Wis., Feb. 12, 1906.
My Guernsey cow, Yeksa Sunbeam, No. 15439, holds the World's record for a yearly butter-fat production, having made in a year **857.15** pounds of butter-fat. She also made **14920.8** pounds of milk testing 5.75 per cent. fat; this is the largest amount of milk produced in a year by any Guernsey cow.

The butter exhibited from my farm was awarded **FIRST PRIZE** over all at the State Dairymen's Convention at Waukesha, Wis., scoring 97½ points.

I use the United States Cream Separator, of which I have three on as many farms. FRED RIETBROCK."

Don't miss the point of this story: GOOD COWS and the

U. S. CREAM SEPARATOR

is a combination that means biggest profit to dairymen. You feed your cows to produce rich milk, and to get the most butter-fat from that milk you need a U. S. Cream Separator because it **Holds the WORLD'S RECORD for CLEAN SKIMMING.**

Our new, handsome 1906 catalogue tells all about the U. S. Read it before you put any money into a cream separator. Just write us, "Send catalogue number 2". You'll get one by return mail. Better lay this paper down and write us now while you think of it.

the 22nd, her hind teats are all right. Her left front teat has a very poor flow. Her right front teat was the same for about two weeks but grew worse until now it has stopped entirely. That quaretr of the udder has been hard until a few days ago when it began to get soft.—Subscriber, Campbell.

Treatment for this cow has been unduly delayed. The results are a dry cow. What is her money value? If she is simply a cow I would turn her off to the butcher; if she is valuable for her breeding, then simply try ot bring back the milk flow by giving her sloppy or succulent feed and gently drawing on the dry portion of the udder, you know the milk flow can be started on a barren cow, or in an unbred heifer by constantly drawing on the teats, so at milking time go through the motions on the dry teats the same as on those giving milk. Milk the teats on the same side at the same time and keep it up until the milk is drawn clean from the teat in flow. Remember if you have not green stuff for her, make her bran as wet as you can induce her to eat it and salt it to create thirst.

* * *

BALANCED RATIONS.

Editor Cultivator:—In your article on "Balanced Rations for Dairy Cows," you give details of ration as follows: 4 pounds bran, 4 pounds chopped alfalfa hay, 4 cocoanut cakes, 1 pound of oil cake meal. Kindly answer is this for one feed or for one day for one cow. Is the ration you give in other parts of the article for one feed or for one day? Any charges will be cheerfully paid. Stamped envelope.—A. C. R., Los Gatos.

To A. C. R. A ration for a cow, is like that of a soldier, a day's of twenty-four hours' feed. This feed is only the grain part and the cow receives her roughage outside in the form of hay or pasture. This ration is for a cow producing three hundred to four hundred pounds of butter in a year and it must be fed up to gradually. In feeding any animal the feed must be approximate and the cow must be the judge, feed all that is profitable and no more. All rations are for a day. This holds good for all rations except where otherwise specified. Divide it into two feeds, one for the morning milking and the other for the evening. The way I think you have become confused was where the printer set up the words, feed double ration to some cows when it should have been written feed a double feed to the cows marked so and so. Now sometimes this is to cows giving enormously of milk, that are milked four times a day, for the short period of a month or so after freshing. The men at the barns really consider this feed by the canful after the ration is formulated, as so many tons of each. Then the head feeder has bins, holding a ton each, he then has so many sacks of this and of that dry grain put into it, then so many sacks of cocoanut cake, wet, into the mixing box. When we make any very radical change in the feed a box of different size is given to the feeder, and to them it is simply so many boxes full, or a half box to this or that cow. When beginning with a grade herd, be careful you do not overfeed with the expensive parts of this ration. Work up to it, only on the cows that will pay for it. There are so many that make a failure in feeding cows from the financial standpoint. It is with the cow like it is with Dr. Jordan's story of the boys, it is useless to give a fifty cent boy a thousand dollar education and expect as a result a learned man, while with a fifty cent education the boy might have been a good stable buck. So be sure your cows have dairy inheritance enough to turn their food into butter and milk; if they have, then feed liberally.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

WHAT IS A MUTATION?

One of the new words that has come into the breeder's vocabulary of recent years is the word mutation. DeVries first used it in the sense that we have it today. Mutation means change. In the breeder's sense it means a change of type, a sudden birth or creation of a new individual differing from his ancestors, having form or qualities not explainable by considering his ancestors. The word means very much the same as the older word sport or freak. The main difference in modern thought is this: Mutations occur from time to time, some for better and some for worse, but in such manner that they form beginnings of new species. That this may be true these mutations have within them as much potency to transmit their peculiar features as though they had back of them long lines of ancestry bearing similar characteristics. This has not heretofore generally been taught or believed.

Today there is ample evidence of its truth. To mention one example; there is the mule-footed hog. At some time in recent years there was born into the world a pig with the mule foot, or one toe instead of two. And that pig had potency to transmit this peculiarity so that now there is a race of mule-footed hogs, perhaps of no special value, but yet serving well to illustrate an important truth. So in each breeding herd, there is possibility of birth of some individual distinctly better (or worse) in some form or feature than any ancestry that ever walked, and with the new understanding of the law of mutations the breeder may hope to fix that peculiar feature, to perpetuate it forever. And here comes in the other thing most essential to know, the law of variation in cross-breeding, the law of Mendel. It is the fact of the acceptance of the theory of mutations by one class of students of breeding problems and its rejection by the rest that make the irreconcilable differences of opinion on breeding matters, as illustrated in the discussions that arise from time to time. Many trained scientists are studying this theory now and seeking evidences as to whether it is or is not a law, with constantly increasing volume of evidence that it is. Belief in this law does not in the least affect the old established theories that "like produces like" (with some important exceptions). It does not in the least relieve a man from his duty to provide the best possible males for his females, and the best possible females to mate with his males. But it explains and illumines some things that have been

THE CUTTER LARORATORY

Berkeley, California

mysterious; it hints whence came the smooth heads of the double standard Polled Durhams; it was first of all a mutation; it tells how there may be pure-bred polled Herefords; it explains the families of six-fingered men and the cats without tails. In other words, it shows how evolution may proceed by leaps and bounds instead of by imperceptible slow gradations.

CARE OF YOUNG PIGS.

Often from overfeeding the sow on perhaps a too-rich ration, one will find some of the young pigs scouring. This is known as the white scours, and if not checked at once becomes dangerous. If the feed of the sow is reduced and a tablespoonful of soda given once daily in her feed, the trouble may be stopped.

One will also once in a while find a large litter of pigs with sore noses and sores along the sides of their faces, and wonder what causes it. If you will watch the pigs when they are nursing, you will see that several of them are fighting for the same teat. You should now catch each pig and with a small pair of tweezers pull each of the four small tusks, which you will find are as sharp as needles, and these are what makes the sores along the sides of the face and nose. This will stop this trouble. After the pigs grow older and become about four or more months old, one may find some of them "humped up," coughing and choking. This is a sign of what is known as thread worm, and they have accumulated in the throat, causing the cough. There is another troublesome worm, known as the stomach worm, which is from six to ten inches long, about the size of a pencil, and tapering to a point at each end. These, when they become numerous, are a source of great unthriftiness, and sometimes cause death. Both of the above species of worms may be expelled by proper treatment, and may be entirely prevented. For prevention, feed any good vermifuge. Use some of the various kinds of "hog dips" by taking about one quart of the crude dip or disinfectant and putting it in a barrel of slop; this is a sure preventative and a cure. Spirits of turpentine in doses of a spoonful in each daily feed will also prevent or cure the trouble. Charcoal is also a most excellent thing for this and for aid in the digestion of pigs that are heavily fed on grain.

Another great pest one sometimes has to contest with in growing pigs is a little black or slate-colored blood-sucker known as the "hog louse," and when once this pest gets into a herd it requires patience and continued care to get rid of them. They multiply very fast and a pig will soon be covered with them, and he cannot thrive, and is constantly rubbing. One may first find this louse by looking inside the ears of a hog or pig. This is where they are first found; then they may be seen along the back, running as fast as they please. They accumulate in the wrinkles of the skin between the legs, back of the front legs, about the base of the ear and inside the ear. They lay a little yellow egg or nit, which adheres to the hair and one often first sees the trouble from this nit before he is aware that his animals are infested.

If one is growing hogs for the market they should be kept growing as rapidly as possible, because the first one hundred pounds can be put on for about half what the second can and the faster they are made to grow the cheaper it will be. To get the best results one should have good pasture, which with liberal grain feeding one can get his pigs off to market at any time after they are seven to eight months old, and should be good to top any market.

Many farmers in growing hogs for market make the mistake of not feeding well enough and by having litters come so late that their animals are not ready for market until every one else has lots ready, and the consequence is that prices break and the market is overstocked. Better try to get your hogs ready a little ahead of the others and you will be able to ship when the market is better. If one is breeding for sale to others as breeders, you of course, would have to have pigs farrowed every month in the year, except, possibly December and January, that you may have animals of the proper age to suit orders.

Give close attention to your herd at all times. It will pay you to do so and pay well. It is certain that there is no adjunct in farming that brings better returns for the amount invested than breeding well-bred hogs, either for the general market or for breeding purposes.

For Wooden Sole Boots and Shoes see O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

CROSSES.

The idea seems to be quite prevalent that crosses make better animals than pure-breds. It is frequently argued that as Berkshires and Poland-Chinas are each good, a cross will be better than either. The crossing of two pure-bred animals of different breeds often gives pigs which are fine animals, have good forms, and will mature very quickly and satisfactorily. When a litter of pigs is to be raised exclusively for slaughter, such crossing is not objectionable, and many careful hog raisers think it the better practice; but the pigs from such crosses, however good they may be are of little value as breeders. The pure-bred ancestors on both sides have been developed toward certain definite but different ideals. In the first cross there seems to be a blending of the two types and the results are often very satisfactory, but the offspring of these crosses are almost sure to show all the weakness and defects of both lines of ancestors as well as many of their own. Breeding from crosses, even though the individual animal may be of good quality is rarely satisfactory or profitable.

Farmers, avail yourselves of the present demand for good horses, produce the kind of a horse that readily sells for a good price.

A pump of the greatest efficiency is P. K. Wood's Improved Deep Well Propeller. This pump has had many years' practical test by irrigators. Where it is necessary to raise water from great depth and under adverse conditions it has succeeded in lifting water with a far less expenditure of power than many pumps but recently invented. Mr. Wood, the inventor and patentee, has made one or more improvements, such as ball bearings and new screw guides, which have added still greater efficiency to this economical pump. Mr. Wood is now in communication with irrigators in Mexico with an idea of installing plants there; also is in correspondence with parties in European countries who are anticipating the use of his peculiar and effective style of pump. A card to Mr. Wood, at 702 N. Main stret, Los Angeles, will bring full description and catalog of these pumps.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

MILK, SKIM-MILK AND BUTTERMILK.

The accompanying letter is so interesting that instead of relegating it to the question box I will discuss it in full, takng it as the text for our weekly talk.

Santa Fe Springs, Cal., 6-1, 06

Mrs. A. Basley,
Hollywood, Cal.

Dear Madam:—I notice on page 499 of last week's Cultivator an article "Early-laying Pullets," in which a Minnesota pullet began laying at four months and eleven days, while a Pennsylvania pullet began at three months and twenty-six days. My first hatch of about 180 chicks, Jan. 3rd, and the balance of 351 on Jan. 10th, arrived at the broiler period with 347 of the 351 alive (one killed by accident, one got lost outside the pen and died from cold, the other two I killed because they took bowel trouble.) On May 4th I found two small eggs in one of the coops, one of which must have been laid the day or day before they were four months old. I am now getting from 14 to 16 eggs per day from them, and the oldest of them lack three days of being five months old. This may sound like a "fish story," but any one doubting the same can find proof of my statements by interviewing my near neighbors who know the facts as set forth above.

Now I wish to get some information through the columns of the Cultivator:

1st. The analysis of skimmed milk.
2nd. The analysis of whey.
3rd. The analysis of the curd.

I let skimmed milk stand or I cook it, feeding only the cheese or curd, throwing away the whey, but am wondering if I am not throwing away good egg and flesh producing material.

4th. In what number of the Cultivator was the formula given for making "United States Whitewash?"

Hoping for the information in earliest number of the Cultivator, I remain, very respectifully

John A. Bevington.

There is one omission in it, we are not informed what breed of chickens is making such phenomenal layers.

I most heartily congratulate their owner on his success, not only in the bringing chickens, to maturity so quickly, but in his success in raising practically every chick to broiler size, in so large a number. This shows that his care of the chicks must be about right or they would not do as well, nor mature as early.

I have had White Rocks that laid at four months and fifteen days, those were hatched in February, but with White Rocks I never encouraged early laying because I wanted large frame in my fowls. I wanted a good market fowl as well as a marvellous layer. I kept my large hens as my breeders and in order to get them, I discouraged early laying and to prevent my pullets from commencing to lay until I thought them large enough and thoroughly matured, I moved them every two weeks to different quarters.

I did not want to master the laying

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

for my object was not eggs for market it was eggs lots of eggs too, for breeding purposes. I fed for that and for fertility, and for any one that wants large fowls, I think my way of handling the White Plymouth Rocks was good, for it gave the large vigorous frame that I wanted.

The Leghorns of course I kept for eggs only, they proved for me grand layers the first year and my plan was just the contrary to the way I managed the White Rocks, I encouraged the timid, nervous little beauties to start in with their family making at as early an age as possible, preparing comfortable nests ahead of time and offering every inducement to them to lay. For I had found with Leghorns that the first years laying was the best, and I could only keep with advantage to my pocketbook the best, highest scoring, largest and handsomest over the second year.

I found then, for I had not then attempted to hasten the moult, that the pullets laid, when hatched early, magnificently all through the fall and the first winter, then they stopped laying in July and did not lay again till January, nearly six months moulting and resting. Now I do not say all Leghorns will do this, but I had beauties. In those days I had not studied the balanced ration. so when the pullets had finished laying I fattened and sold or ate them. I did not want to keep over as breeders.

With White Rocks it was different, for they even lay whilst they are moulting. In fact, when I try to assist the moult, it often seems to assist them to lay more eggs, and I find that my White Rocks lay at two years of age very nearly if not quite as many eggs as they do in their pullet year.

I am telling my own experiences in this matter. Others may have very different, but I made a success of the business and discussing this subject may help others out.

Milk I have found excellent in every form for poultry, and I was rather amused at a clipping sent me by a lady who is using milk successfully with her fowls. The clipping was from an Eastern poultry magazine and read, never feed milk to laying hens, it will make them too fat; feed milk to the hogs. Good for the hogs but excellent for hens (Mrs. D. B.) and don't change your plans on the advice of this clipping.

The analysis and computed value of milk from "Poultry-craft" and the government bulletins is as follows in percentages:

Gross contents percentages: whole milk, water, 87.2; dry matter, 12.8; composition of dry matter protein, 3.5; carbo-hydrates, 4.8; fat, 3.7; nutritive value, 1.04.

Skim milk—water, 90.4; dry matter, 9.6; composition of dry matter, protein, 3.1; carbo-hydrates, 4.7; fat, 0.8; nutritive value, 1.2.

Butter milk—water, 90.1; dry matter, 9.9; composition of dry matter, protein, 3.9; carbo-hydrates,4.0; fat, 1.0; nutritive value, 1.16.

Curd—Water, 72.0; dry matter 28.0; protein, 21.0; carbo-hydrates, 4.45; fat, 1.10.

These analyses I have taken from the government bulletins and from "Poultry-Craft," a most useful text book for poultry keepers.

I cannot find in the books that I now have the analysis of whey, but "Poultry-Craft" says, "Whey is used by many feeders to wet the mash. It contains so little solid matter that the advantage of using it, rather than water, to wet the mash, must be more fancied than real. especially as its solids are principally carbonaceous. If one has it, it will pay to use it, nothing should be wasted. It has not food value enough, however, to make it worth ones while to go to any trouble or expense to get it.

W. B. Anderson of the Indiana Station (Bulletin No. 71) found that skim milk added to the ration. increased the consumption of other food. The greatest average gains were made in the case of such additions. He concluded that skim milk was especially valuable for young chicks in hot, dry weather, and that it is less important when they are older. In later experiments he found (Indiana Station Bulletin No. 76) that with cooler weather and for older chicks the value of skim milk was not lessened. He concludes finally that "milk is most valuable and that by its use one can obtain better results from the other constituents of the ration than otherwise."

In the tenth report of the New York State Station (Geneva) W. P. Wheeler (p 193) says. in speaking of "skim milk for growing chicks:" "An unlimited supply of sweet skim milk can apparently be given to chickens with advantage, but sour milk must be fed with caution. Where sour milk only is available, it is best to coagulate, thoroughly by moderate heating, and feed only the curd. straining out as much whey as possible."

In Bulletin No. 53 of the same station, it is stated that sweet skim milk was fed as profitably to capons as to young chicks and adds, "It is very important that the dishes from which milk is fed should be cleaned often and scalded occasionally."

Personally I have used milk for fowls for many years. I always use sweet skim milk for little chicks, ducks and turkeys. I always use it for fattening fowls, mixing their feed with it. and I give the laying hens and half grown chicks all the milk either sweet or clabber that I can spare them. I have never found it in any way injurious and it certainly promotes laying with my hens.

I prefer giving it to them to drink. I never mix it now with their ration (except for fattening fowls) and I give it to them to drink and scald the vessels more than "occasionally".

Curd is my staple food for turkeys and as now I only feed by the dry method I throw away the whey.

* * *

EDITOR'S QUESTION BOX.

Sick Turkeys. (Mrs. M. D., Anderson, Cal.) I have read your poultry articles with great interest as I am raising some, so I hope you will give me some information about my turkeys. I have twenty little turkeys with two chicken hens; they are now about five weeks old; they have been doing nicely and never were sick until the past week. I have lost four, and on examining them I found their livers all spotted. I did not remove them from the nest till they were 36 hours old; the first day I gave grit and fresh water. then I began feeding chick feed four times a day, and they have a run of 175 acres. The hens don't seem to care very much for them and last week they strayed around the barn most of the time. They have no lice. I use insect powder every week. I have 150 little turkeys running with turkey hens, I feed them the same ration and they are doing fine.

Answer. Your little turkeys have liver complaint, brought on by over feeding or wrong feeding. You had better put your little turkeys if possible under a hen turkey; the chicken hens are not feeding the little turkeys enough green food and too large an amount of grain. I do not like chick feed for little turkeys; there is too much corn in it, and corn ferments in the little turkeys stomachs. If you will notice carefully the mother turkey will eat most of the corn herself out of the chick feed so that when a turkey is the mother the little ones get but little of the corn. Another thing, the turkey mother will not stay by the feed trough or box more than a very few minutes and will then move slowly away calling her young away also, whilst an old chicken hen will fiill herself up and her young also on the feed. For this reason little turkeys do much better with turkey hens.

* * *

BOWEL TROUBLE.

Editor Cultivator:—Can you tell me what to do for my little chicks. When they are hatched and for a week they are nice healthy chicks, and then some take bowel trouble, others die; can't tell what is wrong. They have no lice that I can find. The first flock I fed wheat, the next sweet milk and bread, the next chick food. The old fowls healthy. active and vigorous. The little chicks have a dry place to run.—J. T., Burbank.

Answer. "When in doubt consult nature." The bowel trouble is an indication of taking cold. The chicks are either taking cold from over heating and cooling off, or from cold in some way, or you commence feeding too early; chicks should not be fed until they are 36 hours old.

Sit down and think " am I giving the chicks the conditions they would have under Nature?"

Good air. shade as well as sunshine, fresh. cool, pure water, plenty of green food as well as grains, and animal food also. This can be supplied by milk or hard boiled eggs; it is in the chick feed as dried blood and bone, or beef scrap.

If your old fowl are vigorous and healthy you should raise every chick, barring accident.

Try to keep them close to nature.

* * *

STAGGERS.

Editor Cultivator:—Will you please tell me the cause and cure for chickens that stagger around like something drunk; after a day fall down and apparently lose the use of their legs? As long as they are fed and watered and kept in a dry house they will live for a month or so. Their eyes and comb are bright and are free from lice; are fed bran mash, corn and wheat, with free alfalfa range, plenty of grit and shells. A new case shows up about once a month.—N. E. M., Santa Ana.

The staggers such as your chickens have (you do not mention age or breed) are an affection of the nervous system due to an excessive flow of blood to the head. The cause frequently is from lack of shade, or over heating, lack of pure cool water or anything which would give sunstroke to a human being, chasing by dogs, fright, fighting, etc. The cure is to turn a stream of cold water on the head if they fall down unconscious, give five grains of hypo-sulphate of soda in a little water or a drop of aconite in a teaspoonful of milk; feed light food and plenty of succulent green food and give the fowls shade.

PETALUMA—CHICKEN METROPOLIS.

When one takes a trip to Petaluma, Cal., he is disposed to think that he has reached a new kingdom—a place something like those told about by Gulliver in his travels, says an exchange. Here within a radius of twelve miles is the greatest chicken population in the world, and it seems to the visitor as if there must be a chicken ruler and all the human bipeds were simply for the purpose of catering to the wants of the feathered people.

It is a wonderful population which immediately surrounds the thriving city of Petaluma—a population all dressed in white, with just enough other color to make one more fully realize the vast number of white dresses to be found. This is a busy kingdom, too. The hens are wanted for their eggs alone, and all desire or inclination to set and carry on the duties of motherhood is nipped in the bud, and the would-be mother is told to go ahead and get out a new supply of eggs and let the business of attending to little chicks be looked after by the human servants in the kingdom. A setting hen in and around the city of Petaluma is almost an unknown quantity, and after the hen has served her usefulness as an egg layer she is consigned to the pot, bringing more in the market than she originally cost, while she has paid more than the cost of her keep and care each year.

Within a radius of twelve miles of Petaluma there are seven and a half million chickens. The night after a person takes a trip through this chicken land he is apt to dream of a vast landscape covered with white dots. That is about the way the chickens around Petaluma look. Everywhere you look you see white chickens, and the further you look the more white you see, until just as the horizon comes to your relief the dots seem to merge into a white, snowlike covering. It is all white, for the chicken raisers in and around Petaluma have followed their leader most loyally, and the White Leghorn is the prime favorite.

Nearly half the eggs and poultry consumed in California are supplied by the poultrymen in and around Petaluma, and in addition to this large quantities of eggs and fowls are sent from there to Hawaii and the Philippine Islands.

Take a walk along the streets of Petaluma in any direction and you will be confronted with signs everywhere announcing the fact that the business houses which they adorn cater to a chicken trade. You will see, in addition to the ordinary country-store sign of "Highest prices paid for eggs," signs telling about "poultry feed," "poultry supplies," "poultry medicines," "egg shells bought," "feathers bought," and a lot of similar signs which show that all thoughts in the commercial world have a chicken basis. Even the big factories of the place are built upon a chicken foundation.

The largest factory which builds incubators in the world is at Petaluma, and besides this one there are numerous others devoted to the same industry. In fact, there are more incubator factories in Petaluma than in any other city in the world .

The chickens must be well fed in order to induce them to lay well, and it is estimated that to properly feed a chicken costs $1 a year. That does not sound large when only one chicken is to be considered, but when we figure that there are seven and a half million chickens to be fed it means that it costs in round numbers $7,500,000 every year to feed the chicken population of the Petaluma neighborhood.

It will readily be seen that it takes an enormous quantity of feed of various kinds to keep all these chickens from going hungry. Some of the poultrymen buy their feed in quantities up to 2000 sacks at a single purchase and many of them buy it in carload lots.

The marketing of the poultry products of this territory is no simple matter. A considerable portion of the trade is done direct with San Francisco. Small steamers make daily trips up Petaluma creek from the metropolis, and in addition to these thirty-eight sailing vessels assist in carrying the 500 to 700 cases of eggs which are sent every day.

These cases hold from thirty to to thirty-six dozen eggs each. Besides these cases of eggs the vessels are frequently loaded down to the water line with crates of chickens. Sometimes these loads are so large that they reach from the lower decks to the pilot house.

In addition to these river boats, a railroad connects Petaluma with San Francisco, and this carries thousands of boxes of eggs and crates of chickens in the express car. The bulk of the shipments is made by river, but where it is necessary to hurry goods the trains are brought into play. It costs 10 cents to ship a case of eggs to San Francisco and the case is returned free to the shipper.

In addition to being the largest chicken community in the world, Petaluma has the largest individual chicken ranch in the world. This ranch has on its premises 18,000 laying hens, besides thousands of young chicks in the brooders which are growing up to fill the places made vacant when the old hens are sold off after their third year of usefulness.

CARE OF YOUNG TURKEYS

I am an old turkey raiser. I have raised them twenty years. Experience has taught me many lessons.

So many advocate feeding curd or clabber cheese to young turkeys. I never feed it, for it is not digestible for people or turkeys. I never feed them under thirty six hours after hatching. I use custard, made of milk and eggs. For a flock of seventy little turkeys, I use one-half pint of sweet milk and four or five eggs, stirred together and cooked until the mess crumbles. Feed four or five times a day while small. Have oyster shell, cracked fine, and fresh water always before them. I use a saucer with a tea cup inverted in it, then pour water in the saucer; the turkeys cannot get wet by stepping into the dish.

I sometimes use chicken hens instead of turkey hens for mothers. When I take the mother from the nest I grease her under the wings and on the breast with lard with three or four drops of coal oil in it. Then in eight days I grease again. I watch closely for lice. I sometimes have to grease the litle turkeys when the wing feathers appear. I grease the top of the quill feathers by puhsing the smaller feathers up. I never grease the heads. Where the yellow of the egg is taken into the body or the umbilical cord, or navel I call it, (I do not know what it is called in turkeyology) is a place

$1500

For the above sum, Captain Mitchell of Santa Barbara will sell his poultry business and good will. The outfit consists of 1000 Standard Bred S. C. White Leghorn laying hens and pullets and their fixtures, i. e., Brooders, Houses, Posts, 6 foot "Union Lock" Fence Wire, Etc., Etc.

Sales of eggs for hatching average 14,000 per year at $70 per 1000, and the net income per annum for the last four years has been from $1000 to $1500. For further particulars apply to

Poultry and Eggs Wanted

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX NONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our ON TIME PLAN, and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—It will be mailed to you free.

Geo. W. Foott, Box 2040, Portland, Ore.

where the lice congregate. I never found out until late years that it is a tender place, and I grease there also.

I forgot to say how long I feed the custard. I feed it until the turks are feathered. In fact, if they could talk, they would say, "Give me nothing else." You can see them grow. I feed them wheat mainly. Keep them in a close pen until they get strong and understand their mother's call, which is about a week. Feed three times a day. Put them in a coop at night until they are large enough to fly on to the roost. The first year I raised turkeys I hȧd three to sell in the fall from two turkey hens. Last fall I marketed fifty-two from five turkey hens; kept eight hens and a gobbler to raise from. I have not mastered the art yet. Every year I learn something. I read in one of our farm journals that "turkeys must be fed like cattle when feeding to fatten. Feed corn gradually until on full feed."

I will close these instructions with a turkey tale. One of our neighbors had a flock of turkeys stray off. They had been gone four weeks and were given up as lost. I was at my mother-in-law's in Wellsville. I picked up a paper edited in the town, and my eyes fell on a notice. "Stray Turkeys stating the number.) The owner can get them by paying the cost." I said to my husband, "Go and see if those turkeys are not our neighbor's." He laughed at me, and said: "Do you think they would travel that far?" He went up town and met the man that had the turkeys, and my husband gave a description of the turkeys—so many bronze and so many yellow; and sure enough they were the turkeys. They had traveled thirteen miles. The owner paid the cost and got the turkeys.

DAMP WEATHER AND LICE.

One of our readers complains that the lice and mites, from which her flocks have been comparatively free during the past season, have gained a strong foothold and are making themselves felt in the matter of decreased egg production and slow maturity, delayed molt and some deaths. She says that things have become worse since the fall rains have been falling and that some of the fowls are wheezing, and conditions generally indicate the plague and roup. What can she do to stay the disaster?

Candidly, we are of the opinion that she is simply reaping the harvest of neglect—lice in time of damp weather? Why, yes, it is during such times that they multiply with increased rapidity, seemingly. Fact is, they do not multiply so rapidly during the fall months as during the warm days and nights of summer, but the casual observer is led to believe that the opposite is true because their destructive work is so much more apparent during the cloudy, dismal days of autumn.

The rains make the ground cold and disagreeable to the fowls so that they abandon for the most part the work of dusting themselves, and occupy their time in reaching the irritation with their bills. It is for this reason that few of the vermin are destroyed and as the number increase the vitality of the fowls decrease and presently the whole makeup of the fowl is disarranged and they become subject to colds upon the slightest exposure to draft or rain. In this debilitated condition the rapid advance of colds into symptoms of roup is noticed and fully one-half of our people make the mistake of attempting to cure the disease instead of removing the cause.

Do not be deceived; if your young stock is showing symptoms of roup, look well for lice and mites. Under ordinary conditions the flush of health present in the maturing stock should be capable of withstanding any slight exposure to which it is subjected at this season of the year. It is only when the vitality of the fowls is sapped by body lice and the nocturnal preying of mites that they fall victims to many of the diseases which crop out at this time. When satisfied that lice are responsible for the conditions existing it is high time that you begin an active campaign against the bloodthirsty little pests, and the crusade should last 366 days in the year, ever after.

Would it not be well to take a look into the matter and see how the fowls are spending the nights on the roosts? Take a walk along the roosts some evening and note the restlessness exhibited by the chickens and mark the eccasional rattle from first one and then another. Select one of these detected in the act of wheezing and take it to the lantern-light left safely at a convenient distance from the hen house and see if you do not find sufficient lice on the bird to give you that creepy feeling for the rest of the night. Then and there swear vengeance, not on the chickens, but on the lice, and provide a dust bath in a box set near the windows so that the sun may shine in on it during some portion of the day; obtain some good lice killing agent and go over the flock.

When the work is thoroughly done there will be fewer cases of colds and bowel disorders and the general health of the flock will begin to improve. You can't afford to neglect attending to this matter at once.

NITROGENOUS FEED FOR EGGS

Carbonaceous (corn) feeds are expensive for egg-laying hens. On the other hand, feeds rich in protein cause the eggs to pour down. For example, 100 hens fed on carbonaceous feed—corn predominating—at the Rhode Island station, as against 100 hens fed nitrogenous feed—oil meal used freely—laid only about half as many eggs from the carbonaceous feeds as when given nitrogenous feed. The reason is plain. The 100 hens fed a carbonaceous feed could not make the whites for more than 7908 eggs, in the seven months they were under trial, because the fowls filled themselves with starchy matter to the exclusion of the nitrogenous materials, protein and albumen being needed to make the whites of eggs. Therefore, the pen of 100 hens fed freely on protein and albumen as found in oil meal and meat scraps had all the nitrogenous material needed in building the whites in 17,459 eggs laid by this pen.

It is important to know that the carbonaceous feed returned a profit of only $20.59 for seven months, fed to 100 hens; while the nitrogenous fed pen gave $97.90 profit. Besides, the eggs from the nitrogenous feed were larger and hatched better than did the others. Besides these points, this ration added most weight to the hens that laid the most eggs.

In the face of such facts, sensible people will study to feed poultry such a balanced ration as will insure egg returns and healthy birds, even though they be forced to learn a few hard words. There is no excellence in the poultry yard today without study. Therefore Cultivator readers are invited to put on their thinking caps and investigate carefully every department of poultry culture, with the assurance that we stand ready to assist all who are striving to help themselves.

WHY WE HAVE EGGS WITHIN EGGS.

Instances of eggs within eggs are reported annually in the live stock periodicals, both with poultry and pigeons. Such cases are examples of retarded laying. The oviary channel is, through some unusual exciting state, deficient in lubricating fluid. The one egg, temporarily stopped, is encased in the second, which is thus formed around it. This accounts for the abnormal size of the completed egg, which is eventually evicted, at times with much pain and difficulty, and occasions death not infrequently through egg binding, as it is termed. The condition may be brought about by too much fat forming element in the fowl's dietary—Indian corn, for example, as a sole food—or in a measure may be constitutional and confined to an individual specimen or even strain of birds. The inner egg is often yokeless, though not invariably so.

Soft shelled eggs are ofted caused by an over-fat condition of the hen previous to starting to lay. Oats for the main part of the whole grain ration and cut clover for the bulk of the soft feed will have a strong tendency to prevent the hens becoming too fat, and better egg foods cannot easily be found than oats and clover. Feed plenty of both.

Fresh pure air night and day is the most important thing in poultry keeping.

A safe rule is to feed only what the fowls eat quickly and with a relish.

General Agriculture

CHILI PEPPER GROWING

If a man wants fair returns from any business he must put his mind and, in fact, his whole self into that business. Even at times when he does exert himself a great deal and does good, honest work, he then quite often fails to get the returns expected. But I am ready to say that if the following rules are carried out precisely as I give them, nine times in ten you will have a paying crop of chiles.

General Points.—Chiles are most successfully grown on deep, rich sandy loam, or sediment soil, which will not bake very rapidly. Chiles should be set in damp soil, and if land should easily bake, you will see the land become hard and will dry out more readily about the young plant. Conditions will thus be such that growth will be very slow.

It has been proven many times that to rotate crops farming would be more profitable. Looking at it from this standpoint it is not wise to grow more than two crops on even the best of soils without fertilizing very liberally. I have never tried commercial fertilizers, but have plowed under cover crops and found them very profitable.

The selecting of seed is a very important factor in growing a good crop of chiles. First, select your plant, a low, bushy vine, full of pods of medium length, such as I have here. A tall bush will not produce as many pods and is more liable to be broken by strong winds when loaded with fruits. Besides, the ends of the pods from a low plant will rest on the ground, and in that position they will prop up the branches, provided you will watch your business and keep crowding a little earth to the row at each cultivation so as to form a ridge, leaving a furrow between every row ready for irrigation.

Varieties.—There are several varieties of chiles, but only two are grown commercially in California. One of these, a very dark, thick-meated, cone-shaped chile, growing from 4 ot 6 inches long, usually known as the Mexican chile, is not grown very extensively, but is slowly gaining ground; while the long red, having pods from 6 to 10 inches long, is the best known.

There is another chile, an extra long pod ranging from 10 to 14 inches. The plant is of a good shape, but it will not produce as many pods, nor will a string of these pods weigh as much as a string of the other varieties when each is cured and ready for the market. When green they are thick and heavy, but after they have gone through the drying process, they are thin and very light. Another feature about these is that they contain very little seed. Just open a pod and find out.

How to Grow Plants.—When your seed pods are gathered have them put on a string and hung up to dry against the south end of a building. Do not put them into the evaporator when hotter than 110 to 115 degrees. They may stand more heat, but don't lay temptation in the way of the seed, for if you tempt it too much only 50 per cent may respond to your wishes, and the other half may keep you guessing a week longer than those dried in the sun; neither will it make so strong a plant. The seed is important: watch it closely.

The seed bed is also important and a peculiar thing to handle. Much havoc has been wrought among the young plants this season. Why? Who knows the reason. Some say a bug is eating the plant. Others say a worm lays them low. But I think it is too much moisture, and it would take a good deal to convince me that I am wrong. The plant simply lies down and dies. In selecting your seed bed take a new location each year.

My idea of a bed is this: Select a location where good drainage may be had. Sandy soil is best, but not so poor that it contains no plant food to nourish the young plants. Plow and level the plot, harrowing or raking with a hand rake, as only a small piece of land is used; sow seed in rows three inches apart, covering one quarter of an inch. On this spread one quarter inch white sand. Start your seed beside a large tree, and you will have fair success. The tree will drain your land. When the young plants begin to die, take a trowel and dig out the affected spots and throw them away. The plants should have five or six leaves on before transplanting commences.

Time for Planting—A number of people planted early this season, as many do every year, and nearly every one lost all or a greater part of their plants. These people planted their best seed, possibly selected, in the first bed and lost it. Then poor seed is taken next time. And what is the result? To plant early and out of doors where wind and weather has access to the plants, the chiles will die and do so in nearly all cases. What is the use of planting early? March 10 to 15 is a good time to sow seed unless one has a hothouse. Wet the soil thoroughly before removing plants to field, as roots are damaged less. They should have five or six leaves before removing. — Allen Knapp.

RIDING TOOLS PAY.

There is an idea abroad among a lot of farmers that a man who has a riding plow is lazy. Better farmers know that this isn't true, but that it is the very best economy for the farmer to preserve himself even though his horses must work a trifle harder, that he may not be worn out with his day's work and unable to plan his work carefully for the next day.

The man who manages a farm has more important business than to exhaust himself, plodding along after a tool over soft cultivated ground, when he can save himself by a slight investment in a riding tool and be able to put a lot more enthusiasm in his work. Because the farmer avoids hard labor for himself is no indication that he is indolent. It is rather an indication that he appreciates the need of a clear brain on farm work.

THE RURAL HOME AND SCHOOL

Continued from first page.

ing in a back district there was a meeting of the grange in the school building, and one man after another looked about him in amazement as he saw what the condition of the schoolhouse was. They decided to leave the interior of the house to the women, and to make a bee of their own number to improve the grounds. One man offered the use of his team, then another volunteered. They painted the building. The land about the school building was drained, and the stone wall was thus permanently protected and repaired. The roots were dug out, the soil turned over, and the yard graded. There was plenty of room reserved for the boys and girls to play, but in front of the building the yard was made very attractive. A walk was laid from the doorway to the steps. A hitching post was set, the flagpole raised and a new rope put in the pulley. A fence was built around the yard to keep out the stray farm animals and to lend neatness to the place. A few strong, young maple trees were carefully planted. not in a row in front, but irregularly massed at the sides. A discussion arose as to whether shrubbery, if planted. would suffer destruction at the hands of the boys. but it proved to be an unnecessary cause of anxiety, for the boys and girls took a hand in the planting, and with a sense of ownership they took as much care of the plants as a gardener would of his most choice varieties.

The woodshed was moved to the rear of the schoolhouse, and the children watched with interest, from day to day, the growth of wild clematis, which they had planted to cover the old shed. Trees and vines were planted about the closets, shielding them from view. These buildings were put into a safe, sanitary condition, thus reducing the possibility of moral and physical injury to the children. After everything was put in order the children occasionally were formed in line by the teacher, and, with baskets in hand, walked over the yard, picking up the refuse.

You cannot divorce the rural school from the farm home. Try as you will, even by means of utter neglect of the school, yet the school and the home are inseparable. One has an effect on the other. Both school and home train the child. The child lives in both. Your responsibility does not stop when your children go to school in the morning. They are your children still.

Queries and Replies

GUINEA EGGS.

Editor Cultivator:—Can you tell me where I can get guinea eggs?—W. O. B., Glendora.

Some breeders should advertise. We do not know who has them for sale.

PRUNING OLIVES.

Editor Cultivator:—Please tell me in your valuable paper when is the best time to prune olive trees, also if it injures them to prune them in the late spring or summer months.—W. E. M., Murrieta.

The usual time to prune olive trees is just after the fruit is picked. However we have seen olive trees pruned from December to August and could see no injury having been done. Only in case the trees had no fruit would we prune in the summer.

WEEVIL IN CORN.

Editor Cultivator:—I have a small bin of shelled corn which has weevils in it. They are eating it up. They started first in a bin of rolled barley and now are in the corn. Can you please tell me what to do for it?—H. C. B., Toluca.

Place a pint of bisulphide of carbon in a pie plate and set in on the top of the grain in the bin and cover over the top with boards and sacks. The object is to stop all openings. After 48 hours there will be no live weevils in your grain.

TREE DISEASE.

Editor Cultivator:—Enclosed I send you a sample of Ben Davis apples which is diseased. The last two years the tops seem to dry up and then the blossoms die. Would you be kind enough as to let me know through your paper if there is any remedy for them, also what is good for curl leaf?—Subscriber, Santa Ana.

Bordeaux mixture, four parts bluestone, four parts freshly slacked lime, both by weight, and 40 gallons of water will cure the fungus on your apple trees and curl leaf on your peach trees. Spray as late as you can before the buds open in the spring. If there is any sign of the disease after the leaves come out give the tree another spraying.

In mixing the spray material put all the lime in half the water (20 gallons) and all the blue stone in the balance, then mix the two. A better spray material is made that way than when mixed in a concentrated form and then diluted.

ROOT KNOT.

Editor Cultivator:—Some time since I wrote you asking about my peach trees and received a very satisfactory answer, for which I thank you very much.

Now I am trying to clean up an orchard for a friend of mine. It has black knot very bad. Prune trees on peach root. We believe they were diseased when at the nursery, as two orchards owned by two men are affected like mine and are of the same stock, put out the same year.

About 90 percent of the orchard is affected; about 50 per cent half way round. Some only two inches or so of bark left, but still alive and bear a good crop—better than the healthy trees. Ground pretty well tended, not many borers. When the knots are dug off the tree looks pretty badly girdled. I have been clearing off knots and putting on good coat of white wash. Trees are 15 years old. Will it pay to try to save the orchard? What can we do for it? I recommend the Cultivator to all. Please answer as soon as convenient. Yours, A. H. S., Campbell, Cal.

When fruit trees are more than half girdled by crown knots it is not worth while to try to do anything for them. Deciduous trees may be badly diseased with these knots and still continue to bear, but the fruit is not of as fine quality as that from a healthy tree. Diseased plants are always under a tree, endeavoring to reproduce their kind. This cannot last long. The badly affected will rot off in a few years or become so weakened at the points where the knots form that heavy winds will break them off. We have not seen a case where a tree with a strip of bark on one side and the balance of the circumference killed with crown knot amounted to anything. Where the knots take less than half the circumference the tree may be much benefitted by cutting out the diseased portions and saturated with a one-pound to ten-gallon solution of blue stone and water. We know of no sure cure or anything that prevent the knots forming.

ANTS IN GARDEN.

Editor Cultivator:—Please tell me the best method of getting rid of ants in garden.—J. G. W., San Jose.

There are a score or more of treatments that seem to be successful with some people. We give four in common use. 1. With a cane or broom-handle or other round stick make a hole (if a large nest, two or three holes) to the depth of a few inches, and pour in a tablespoonful of bisulphide of carbon, filling up the hole thereafter with earth. 2. Spray the entire surface with strong kerosene emulsion, or pour kerosene oil into the hills. 3. Punch a hole. fill with naptha, take the can to a distance of several yards, and ignite the naptha in the holes. 4. Pour in boiling water. We will add a fifth: Look in our advertising columns and note a remedy there recommended, give it a trial, and let us know the result.

FREE SEEDS.

It is strange that in a gift enterprise so meritorious that Congressmen do not change the character of the goods. Let them drop the seed business awhile and send out instead something useful, a patent hay-rake, a typewriter, a clothes-wringer, a husking peg. The government could as consistently run a whole department store as a mere department, and with its well known aim to please endear itself anew to the people.

The decison to retain the old plan was hailed with joy by many clerks strongly attached to their salaries, by tradesmen furnishing the paper bags, by experts who won't let a pea go forth unless it has the symmetry fitting it to be used in little Johnny's pea-gun, and by Congressmen who want to keep in touch with the folks at home.

The mere fact that the money expended for seed distribution is an absolute waste might be considered but economy is a detail, and this is a day of big things. Besides there have been provided costly warehouses and machinery, and Congressmen deprived of the right of pelting their constituents with seeds that the constituents want, just to show themselves in direct touch with the government, would never relinquish the privilege. They have grown so accustomed to it that any motion to assail it strikes them as a furtive blow at the Constitution.

ALFALFA BULLETIN.

Alfalfa seed is so valuable a crop that many would be glad to produce more of it if it were possible. The conditions favoring the production of seed are not well known. As the result of an inquiry throughout the State, the Kansas State Agricultural College Experiment Station has issued Bulletin No. 134, on "The Alfalfa Seed-crop and Seeding Alfalfa." This bulletin will not enable one to produce a crop of alfalfa seed at will, since some of the conditions are beyond our control, but it will be of value to every grower of alfalfa. It may be obtained free by addressing the Agricultural Experiment Station, Manhattan, Kan.

The latest revised catalogue of the Vermont Farm Machinery Co., Bellows Falls, Vt., has been received. Anybody wishing to study the making of one of the best cream separators made should by all means send for a copy. The U. S. Cream Separator has swept the premiums in many a state contest, while its record at the different World's Fair expositions is truly remarkable.

An experiment at the Maryland Station proved that sawdust was the best and cheapest available bedding for cows at that point. Where cows were continuously stabled wheat straw, sawdust and shavings cost respectively $4.15, 40 cents and $4.81 a year.

Geo. H. Croley & Co., before the fire at 512 Sacramento Street, San Francisco, have opened an office at 754 Main street, Petaluma, Calif., and are now able to fill orders for goods promptly.

THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—30 cents per foot and prepay the freight.

Driver, Aber & Co., San Leandro, Cal.

EASY TO PUT ON

a Permanent Protection

Save the expense of a professional roofer. Any man, any workman, with a knife, a hammer, an old paint brush and a little care can lay a perfect roof.

Pioneer

Rubber Sanded Roofing

Is the best protection for any sort of roof. Tar melts, clogs the drain pipes, smears the building. Shingles warp. curl and split. Tin rusts rapidly. Metal roofs quickly become leaky. ***PIONEER RUBBER SANDED ROOFING*** overcomes all these difficulties. That wear-proof surface of hard flint sand adds years of wear to the roof. We will gladly send samples and prices. Booklet "D" will tell you all about the best roofing and building papers for every purpose. It is free.

NOTHING TO SAY.

Nothin' to say, my daughter; nothin' at all to say,
Gyrls that's in love, I've noticed, ginerly have their way,
Your mother did afore you, when folks objected to me,
Yit here I am, an' here you air; and yer mother—where is she?
You looks lots like yer mother; purty much same in size,
And about the same complected, and ,favor about the eyes,
Like her, too, about livin' here—because she couldn't stay,
It'll most seem like you was dead—like her; but I hain't got nothin' to say.
She left you her little Bible—writ yer name acrost the page—
And left her ear-bobs fer you, if ever you come of age,
I've allus kep' em and guarded 'em, but ef yer goin' away—
Nothin' to say, my daughter; nothin' all all to say.
You don't rikollect her, I reckon? No no, you wasn't a year old then,
And now yer—how old air yer? Why child, not twenty; when?
And yer nex' birthday's in Aprile? And you want to get married that day?
I wisht yer mother was livin'; but I hain't got nothin' to say.
Twenty year; and as good gyrl as parent ever found,
There's a straw ketched onto yer dress there; I'll brush it off, turn 'round.
(Her mother was jes' twenty when us two run away;)
Nothin' to say, my daughter; nothin' at all to say.

—By James Whitcomb Riley.

PRACTICAL HOUSEKEEPING.

Nothing gives zest and interest to housekeeping so much as the intelligent application of principles that saves time and labor. Housework without thought is drudgery; with it there is delight in the accomplishment of those duties that transform housekeeping into home-making.

It is sometimes thought that any one whose cooked products can be eaten knows how to cook; that dishes are well washed when they look clean. It is equivalent to a fine art to do either of these household tasks well; and a woman who knows how is greatly appreciated in her own or in any other family. Girls brought up in ignorance of the practical things that make the home are deprived of a blessing, as well as handicapped for duty.

Pedagogy teaches that intellectual interest is necessary in acquiring knowledge. Terrors of housekeeping vanish, to some extent, when interest asserts itself in domestic life. The future happiness of all concerned depends upon the mental attitude of the worker. Nothing contributes so much to securing this quality as the lively desire to do work in the way that will best secure good results and conserve time and strength.

Do I hear you say, "With so much to do, there is no time to try new methods; the work must be hurried through anyhow?" The housewife is often an all-round, intelligent worker who must perforce crowd into her busy day work belonging to a dozen different professions. This gracious lady who receives her guests with a heartsome welcome is also a capable cook, the exquisite laundress, and the artistic housekeeper.

The most useful life may be made up of these details. The spoke of a wheel is only one stick of wood, the hub a larger piece fashioned to receive the spokes, the tire but an iron band to hold all in place. Without the spokes, the wheel lacks strength; without hub, the very center is lacking; without rim, the wheel has no stability. These domestic trifles are the condition of man's mightiest achievement, or are very possible elements in his defeat. A soggy potato has weighted many a man's soaring ambition. A complaining word, a sour look, a bitter tone, has taken the heart out of a man. Poor coffee has dampened the ardor of many a potential poet. Therefore, a woman cannot reasonably say that housework is mere drudgery, a round of soulless routine, and void of pleasure and interest.

A few years ago the school of domestic life was the home kitchen; the mother was the teacher; the pupils began at an early age and never graduated; the only book was experience with real conditions. Chemical and physical forces worked then in the mixing of ingredients; the influences of fire and water were as great as now; the care of the human system was as much governed by laws as now; but experiment and chance were the controlling elements in a housewife's education. There were good cooks then as now; there were neat and careful housekeepers; there was great devotion to household cares; but these virtues came with great labor and usually without fundamental knowledge.

Gold of Ophir Rose Courtesy Pasadena Star

The work in many homes is governed the same way today, but not so successfully. The simpler life of earlier times has given place to the great unrest of the present day; the cooking is more complex; a complete change has taken place in the methods of furnishing raiment; the art of keeping a clean and sanitary home has grown greater with the perplexity of living, with a larger population, and a greater knowledge of danger.

Without knowledge of these changed conditions and the ability to meet them, there will be much discomfort, much unrest, much that is not satisfying in the domestic world. Untrained maids will fly from kitchen to kitchen; the young wife will weep over her failures and depend upon a brief respite brought from the passing maid, from the reading of cookbooks, and by consultation with older and wiser heads.

With acurate knowledge comes skill in household affairs; with skill comes joy in the work. When this end is attained, interest will hold the maid in her flight and lend a charm to the making and the keeping of a home. Yet a scientific knowledge of household affairs is not altogether sufficient to relieve the domestic difficulties. There is no doubt but that an interest in housework is necessary in order to make it enjoyable, and that interest increases with knowledge and study. However, there is a step higher which must be attained if domestic duties are to be enjoyable. While we advocate making domestic science a part of a woman's education, still her accomplishments in domestic lines are greatly enhanced by culture, refinement, a life with books and with nature. The woman who by reason of her training has a large insight into the bacteria of the kitchen sink, who knows the song of the bird, the home of the insect and who studies the web of the spider, has just so more of the enjoyment of life. She who makes the appointments of a dining-room artistic and attractive, and finds pleasure in doing it, is a greater woman if she knows why she selects a certain madonna for her walls, of if she can paint a landscape to hang there. The music of poems is a desirable accomplishment to the song of the teakettle, the beating of an egg, or the rubbing of the clothes upon the washboard. The eyes may be attracted by the beauties of the landscape at the backdoor, giving somewhat of a zest to the dish washing, or even to the sweeping. Ability to play the piano should make a woman happier when she hears the prattle of little ones calling for attention, or starts the kitchen utensils into a merry hum in preparing a dinner or clearing it away. The four walls of a kitchen are much less monotonous if relieved by an occasional journey; life is broadened by travel.

Housework is called drudgery, but all work is drudgery until softened and relieved by life outside of dreary monotony. One objection on the part of woman to confining her time and thoughts to domestic life has been the desire to take part in occupations which offer seemingly wider experience; but a woman bound to make all that is possible out of her life in the home bids come to her use some knowledge of chemistry, physics, bacteriology, physiology, botany, zoology, art and many other interests. Her field, therefore, is great when she per-

fects her knowledge. Her spiritual aspect toward the work in hand, and her knowledge of principles to be applied, govern to a great extent her enjoyment and usefulness.

Of no little importance is her physicil development. Domestic life calls for large energy, calm nerves, fine physiques. The athlete uses his muscle to develop it. Shall not the housekeeper do the same? Every opportunity for gaining physical strength must be grasped with eagerness, for with the average woman housework fails in its pleasures and possibilities when physical strength has waned. With its failure comes a weakening of nervous energy and a lack of spiritual enjoyment.

Housework expresses the science of living. To woman is entrusted this great field of activity. Other occupations are dependent upon this one; the happiness and ability of men are dependent upon a woman's success in the art of living and of making it possible for others to live. Therefore, the merit waits upon the housekeeper, and we would pay a high tribute to her who studies to make it a science and an art. Regarded as a special education, domestic economy is in its infancy. The safety of the home is now considered to be more dependent on knowledge, refinement, culture than on constant drudgery and too close application to work.

As much muscular energy is used in sweeping, dish-washing and general housework as in tennis or golf, but the state of the mind is different. When a woman introduces into her routine an effort for higher attainment in the art of practical housekeeping, or when the routine is relieved by the enjoyment of pleasure in view—the time to read, an entertainment, an anticipated visit, or music—she sinks the heavy feeling of despair over never-accomplished labor in the anticipation of other things. Then, while she must labor on, may it not be well to sing a song, laugh in the midst of difficulties, enjoy the sunrise and the sunset, and smile at the fortune which made her a housekeeper.

ON THE USE OF PERFUMES.

The girl who is fastidious to the point of observing little niceties is chary in her use of perfumes.

She never indulges in those which come in liquid form, except to put a few drops in the bath water, and those in powdered form she selects with the greatest care and never by any chance those that are at all aggressive.

The moderate use of heavy scents is in most execrable taste. It suggests blowsy hair and cheap imitation jewelry, and is distinctly to be avoided.

It is the Scylla and Charybdis which has wrecked more than one young woman's aspirations, and a habit which, like the habits of smoking and gum chewing, grows with indulgence.

Frequently, perhaps generally the abuse is the outgrowth of a liking for a delicate perfume, which being persistently gratified, increases, dulling the senses until stronger and stronger scents are required to satisfy, and the wearer is unconscious of the distasteful effects upon others.

So, the better way is to dispense altogether with the liquid perfumes and substitute sachets, as many as you will as long as they are the delicate odors. Fasten them here and there in the gown or in the wrap, and scatter them about the trunk, even with the trunk sachets.

HUSBAND IN HOUSEWORK.

Every once in a while there comes a complaint from the men that their wives are not thoroughly competent housekeepers. They have no patience with a woman if she does not know how to perform all the duties about the house, but it never seems to occur to them that they have any household duties. They feel aggrieved if asked to do anything outside of their regular business, and moan if asked to bring up a hodful of coal, mend a window fastener, or put a washer on a faucet. Sometimes it is indolence that makes them shirk these tasks, but a great many times it is incompetency. A man should know how to perform a simple piece of carpentery, a little job in plumbing, just as well as his wife should know how to make bread or set the table. There is no reason why he should not be handy about the house instead of being obliged to call in paid workmen everytime there is a little something out of gear. There are some men who are not able to bring down the screen doors and hang them, who do not know how to put up a clothes line, who do not know how to fasten the hooks for the hammock, and are utterly at sea when it comes to mending anything. As for helping their wives in their domestic duties, they think themselves insulted if asked to do such a thing. Yet there is no reason why a man should not aid his wife in her hurry to do up her work in order to go out with him, by clearing off the table, helping at washing the dishes, and even paring the potatoes. Really great men are not afraid to aid their wives in the simplest duties. I have seen a man who holds a position of great responsibility get up from the supper table and quietly begin to remove the dishes so that his wife will not have to flurry to get ready for an evening's entertainment. I have seen a dignified, thoughtful business man always step forward, when his wife was doing some heavy piece of work, with the words: "Here, let me do that." These men did not seem to think thev had taken anything from their dignity, because they were willing to turn their hand to household duties. They simply saw there was a way in which they could help, and proceeded to give their services.—Motherhood.

FATHER'S TIME.

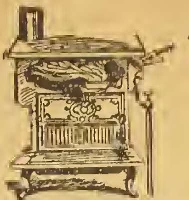
"Oh, no, I cannot go with you after dinner tonight, because that is father's time, and we always have so much fun then."

That is what I heard a little maiden say to her school friend, who had invited her to go somewhere with her.

"Father's time." I wondered what that meant, and so I asked the little maiden. "What is 'father's time'?"

"Oh," said she, "'father's time' is right after dinner at night, an hour or so before we go to bed. Father makes lots of pleasure for us then, and it is the only time we can see him, except in the early morning, and that is for such a short while. Father never goes away at that time, neither do we; we give that hour to him, and he gives it to us. It is our 'together hour.' Oh, he is such a good, dear father!"

What a testimonial to the high standard of fatherhood was the speech of this little girl! Away all day, immersed in business cares, the father could give no time to his children except the hour before their bedtime. With what happy, light hearts those little ones kissed him good night when bedtime came, and with what smiling faces they went to sleep to dream beautiful dreams of father love!—Evangelist.



BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIO OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to

Hague Domestic Oil Burner Co , 810 So. Spring St., Los Angeles, Cal.

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

SIEVERT OIL BURNER CO. 1005 N. Alameda St. Los Angeles, Cal.

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Choice of

MANY ROUTES

East and West

SOUTHERN PACIFIC

SUNSET Via New Orleans and El Paso

OGDEN Via San FraScisco

SHASTA Via Portland

Pullman Vestibuled Trains Daily. Personally Conducteo Tourist Excursions via all routes every day in the week at Reduced Rates. The SOUTHERN PACIFIC gives you choice of many routes from the northern boundary of the United States to the Atlantic Coast, so that you may go one way and return another, with varied scenery and climatic conditions.

Full information at 261 S. Spring St., Los Angeles, or from any agent

SOUTHERN PACIFIC

A Delightful Way to Go East

Is Via The

Scenic Salt Lake Route

Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City, thence over the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's

BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.

SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.

THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.

SALT LAKE ROUTE

THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.

DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.

EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.

EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:
May 25, 26 and 27—New Haven, Conn. Rate 92.10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50 St. Paul and Minneapolis, $70.00. St. Louis, Memphis and New Orleans, $67.50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.

Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returning.

T. C. PECK, A. G. P. A., Los Angeles, Cal.

VULCANITE
ROOFING

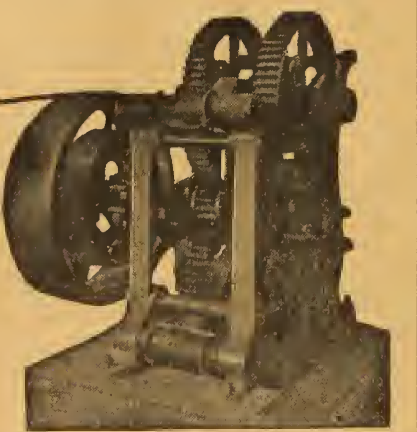
JUST THE THING ALL
THE YEAR ROUND

Non-conductive of heat and cold. Does not buckle—lays perfectly smooth. A material which is at once light, strong, durable and cheap, and at the same time water-proof, wind-proof, acid and fume-proof. Also used for covering outside of buildings, floors of warehouses, offices, etc. Requires no paint; is permanent and inexpensive. Comes in various weights.

Samples and price list upon application.

C. SCHEERER & CO.
255 S. LOS ANGELES ST.
LOS ANGELES, CAL.

The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas. Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosph r bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pu np head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Ani a Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make"

We have pleased these people and there is no reason why we cannot please you.

HIGH PRICED FRUIT.

Fresno, June 12.—Two of the biggest canning concerns opened their plants today, employing about 500 men and women each.

Sharp bidding on the part of the canneries, together with the scarcity of good fruit, has caused prices to soar and the packers are paying an average of $35 a ton for apricots. The quality of the fruit delivered so far is below the average, being small and marked by blight.

The packers and canners are already in the market for peaches and the price of that fruit will be higher this year than ever before.

SAN FRANCISCO SHIPPING.

Import and export trade have shown no great change from normal conditions. The great activity on the water front, so characteristic of San Francisco, has maintained its usual proportions. In fact the immense freight carriers of the trans-Pacific lines are loading and unloading an increased tonnage at the busy docks. Sixteen hundred and forty-three tons of silk, tea and rice was the last cargo of the Hongkong Maru. Fifty-three vessels, with cargoes to all parts of the world, sailed from this port a few days ago within forty-eight hours—the largest fleet within ten years past.

COULDN'T LAY EGGS.

Country schoolmaster, who has received a basket of egg as a present, and utilizes the same for arithmetical purposes: "Now, Peter, here are nine eggs in the basket; if I lay nine more beside them how many would that make?" Peter giggles heartily. "What are you laughing at?" Peter giggles on. "If you don't tell me why you are grinning I shall cane you." Peter (struggling with his grin:) "Please, sir, you couldn't lay no eggs if you tried, you couldn't."

P. K. WOOD'S

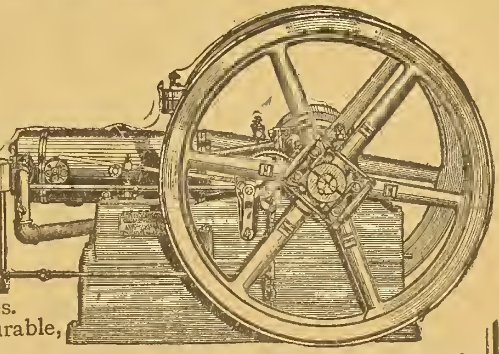
Improved Deep Well Propeller Pump

FOR IRRIGATING AND MINING

After devoting several years to deep study and experiments, and the expenditure of many thousands of dollars, this pump has been brought up to the point where it is practically indestructable, has an efficiency not to be excelled, and is ready to try conclusions with any deep well pump on earth. The principal improvement consists of a screw guide inserted in casing cupling and a ball bearing placed in each guide, which gives absolute protection to all parts of the pump, regardless of the amount of sand or grit which the water may contain. Write for catalogue and full description of these important improvements.

P. K. WOOD, Patentee and Manufacturer

702 No. Main St. **Los Angeles, Cal.**



Gasoline Engines For Irrigating.

THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in **full, regular and long sustained power.**

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), **4, 6, 8, 10, 12 or 15 Horse Power.**

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

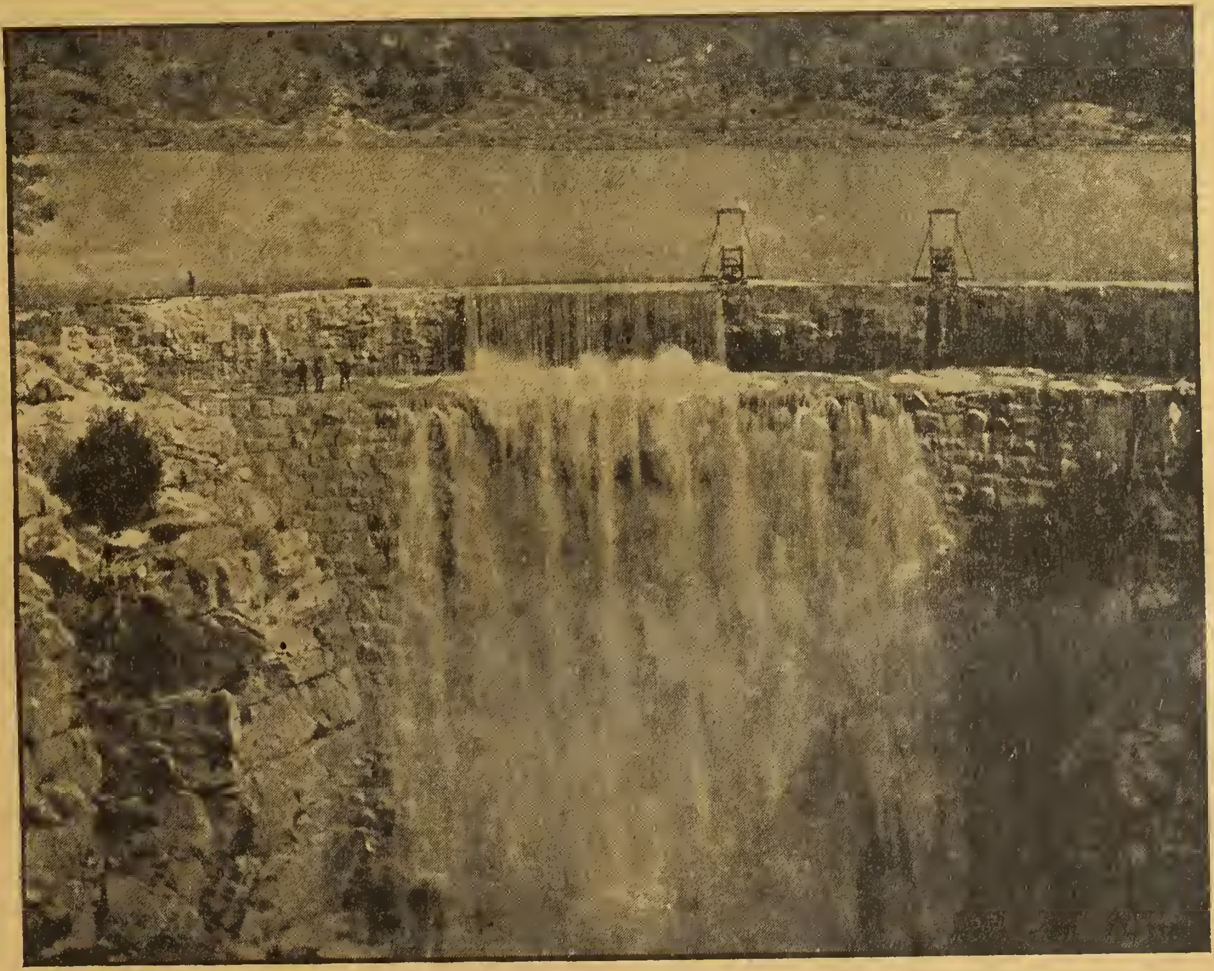
CALIFORNIA CULTIVATOR

DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES

LOS ANGELES JUNE 21, 1906 SAN FRANCISCO



The Great Hemet Dam.—The great Hemet dam is located 23 miles from Hemet. It is the largest piece of solid masonry in the West, being 250 feet across at the top, 125 feet high, 100 feet thick at the base and 32 feet thick at the top. Nearly 10,000 barrels of imported cement were used in its construction. It closes up a narrow canyon which is the only outlet of the large valley that forms Lake Hemet. During the rains of March, Lake Hemet, a vast body of water, sufficient to irrigate the ten thousand acres of the Hemet Tract for several years, overflowed this dam. Its capacity can easily be doubled.

STANISLAUS COUNTY.

This rich farming section lies in the great San Joaquin Valley, 114 miles south of San Francisco and 90 miles north of Fresno, and is traversed by five lines of railroad. One of them is the main trans-continental road between San Francisco and Los Angeles.

The soil is principally a rich sandy loam; some adobe; no alkali, and will raise almost anything that can be grown in a semi-tropic climate. Oranges ripen for Thanksgiving trade. The mild winters are without snow and very little frost. It has pleasant summers, on account of sea breeze to cool evenings and nights, and cool nights without dew.

Its products are: Fruits—Deciduous and citrus; nuts, grapes and the famous Calimyrna fig. Especially adapted to olives, peaches, apricots, almonds and grapes.

Dairying—At present seventh in state in point of production, having advanced from 12th to seventh in two years. The home of alfalfa, the principal forage plant of the Pacific Coast.

Poultry—Climate and conditions ideal; green feed the year round; San Francisco market near and still depends upon Eastern supply.

Its irrigating water supply is one of the best in the state, and the secretary of the county board of trade states that water costs from 50 cents to $2.50 per acre per year, according to the system used and the extent of the improvements.

The National Wood Pipe Co. has offices at San Francisco, and Los Angeles, California, and Olympia, Washington. They are widely advertising their continuous stave pipe, machine banded and bored pipe for irrigation systems, as well as mining and power plants and city water works. This pipe ranges in diameter from ten inches to ten feet and can be made in any length desired and is so constructed as to stand almost any pressure. It is always built continuous and in place, all staves, bands and other materials being delivered to the pipe line in knock down form. It is especially fitted for power plants and for all water systems where it is desired to deliver a large volume of water. They solicit inquiries and should be addressed at the nearest office. Will cheerfully give information but request that the size of the pipe be stated, the length of pipe line, maximum head or pressure, the amount of water to be delivered, whether it is a gravity or pumping system, and where possible, send plans and profile of system. Their advertisement appears in the Cultivator.

SOLVING A PROBLEM.

The bringing together of the landless man and the manless land is a problem the satisfactory solution of which in America will do more to remedy social evils, and to preserve democratic ideals, than almost anything in the domain of economics; and the chief obstacle in the way of such solution is the greed of the big landholder and the speculator.

The Temple Pump Co., one of the oldest engine manufacturers of Chicago, has recently opened a temporary branch in Oakland with Mr. David Rutherford agent in charge. They manufacture either portable, stationary or traction; 5, 7, 10 and 15 horse power in stock. This company is very proud that it is their fifty-third year of manufacturing. Send for catalogue and address Mr. Rutherford at 1396 Harrison St., Oakland.

Fifty Cent Pieces Running Around on Legs

And How They May be Made to Earn Five Dollars Profit

The ordinary laying hen sold in the market would bring about 50c; therefore a flock of common hens might be known as 50 cent pieces running around on legs.

But, you take these hens and feed them once a day a meal of **COULSON'S IMPROVED MASH EGG FOOD,** and these hens will coin money for you every day.

According to San Francisco market prices for eggs, a good hen (fed on Coulson's Mash Egg Food every day) will lay enough eggs in a year to value somewhere between $3.00 and $4.00. Feed the hens for 2 years on Coulson's Improved Mash Egg Food, and during this time they will lay enough eggs to earn $5.00 per hen profit, more than the cost of the feed. Then you can send the hens to market and get the original value of 50c back again for her.

So when you can make $5.00 gold pieces out of 50 cent pieces, by feeding the hens **COULSON'S MASH EGG FOOD,** you can't make money any easier.

A word to the wise is sufficient. It is to your best interest. Go to your store-keeper and order a few bags of Coulson's **Improved Mash** Egg Food.

RAISING CHICKENS?

I Certainly Would Feed Them Coulson's Mixed Poultry Foods. Why?

Johnny Bull Tells Why He Would Use Coulson's Poultry Feeds.

1st. I know how nice Mr. ——— hens looked when I saw them; what nice red combs they had, and what nice healthy birds his hens were. I know that Mr. ——— was getting two cases of eggs a week in the Fall of the year from 350 hens, when other people's hens were not laying at all, and when eggs were bringing him 51c per dozen; and he has been feeding Coulson's Feeds for over a year, which show how good the feed is, for his hens netted him a profit of $2.00 apiece last year. Most people only make $1.00 per hen per year.

2nd. I know that there are other large poultry ranchers near Petaluma who feed Coulson's Feeds. For instance, Mr. Geo. Gaston has FED THE FEED FOR THREE YEARS every day to 3000 hens. Then there is Mr. W. W. Freeman, who has fed

A 50¢ HEN FED ON COULSON'S MASH EGG FOOD EARNS $5.00 PROFIT IN 2 YRS.
50¢
50¢
50¢

$5.00
5.00
5.00

Coulson's Poultry Foods for about three years to 4000 hens; and Mr. De Rezendes at Tomales, has fed several thousand bags of it and buys it in car lots. All these are successful poultrymen, and if the feed was not good they would not continue to use it so long, and their being successful poultrymen, they know that Coulson's Egg Food GIVES THEM MORE returns than any other feed for the money.

3rd. Then there is Mr. Henry Graff, former President of the Pacific Coust Poultry Association, and a very successful poultryman, who makes his flock of 2000 hens average 184 eggs per hen per year, which is nearly $4.00 per hen, according to the market price for eggs in San Francisco last year. I know that if these successful poultrymen use Coulson's Foods, then I should use them too.

Hens Need a Good Balanced Ration

4th. Then I know that hens need a Balanced Ration, and that they need Meat Meal, Blood Meal, Bone Meal, and such things, and they get all these in Coulson's Foods. I know that if I were to go to a store to buy these Meat Meals, Blood Meals, Bone Meals, etc., that I would not be able to get anything good, for it would all be fertilizer stock, which would not be very good to feed to the hens, as it would not agree with them, and therefore prevent them from giving good results. In any case the stores from which I could buy these articles, would charge me a high price for them, as they only handle them in small quantities, while the Coulson Co. get these supplies (Meat Meal, Blood Meal, Bone Meal, etc.) by the carload, and therefore, can afford to sell cheaper, and I will get them ALREADY MIXED with the feed.

Healthy Hens are Profitable Hens

5th. I know it PAYS TO KEEP THE HENS HEALTHY, and that the hens need Flaxseed Meal, Condition Powders, Charcoal, etc., and that they get all these in Coulson's Feeds. I want my hens to be healthy, and not sickly, like other people's, which I have seen, where they were fed only cheap feed, and I know that if I feed them Coulson's MASH EGG FOOD, they will get all they require to keep them healthy, and they WILL DO SO WELL on it.

6th. What is the use in spending so much time every morning, mixing up a little chicken feed, when I can get it already mixed by machinery, and when it contains everything that is needed? All I have to do is to take the feed out of the sacks, and mix it with a little water, and it is ready for the fowls; whereas, when I mix it by hand, it would take at least two hours every morning, and then it would not be mixed as well as when it is mixed by machinery.

Cost Is Not Much--Two Pounds Feeds a Hen a Month

7th. Coulson's Mash Egg Food doesn't cost much, a 90-pound sack will make a meal for 1250 hens. A little more than two pounds will feed a hen for a month, and if a hen lays three eggs a month, it pays for the feed; and I know of some hens that were fed on Coulson's Feed, that laid 23 and 24 eggs a month.

Profit In It for the Feeder

8th. It's results that I'm after. So long as I am keeping hens, I am going to make as much profit out of them as I can. I know a poultryman at Elmira, with a small flock of 400 laying hens, which he fed every day on Coulson's Mash Egg Food, and he sold over $1100.00 worth of eggs from them in one year, making nearly $700 clear profit from 400 hens, fed on Coulson's Feed. You bet, it pays to feed the laying hens, COULSON'S IMPROVED MASH EGG FOOD.

What the Little Chicks Would Be Fed On

9th. I would feed the baby chicks on Coulson's Special Dry Chick Feed every time, especially until they get to be 6 or 7 weeks old, anyway. I would scatter cut chaff on the brooder house floor, and would spread the Coulson's Special Dry Chick Feed around in this. This would give the chicks splendid exercise and keep them busy and contented; and in this feed they would get all that they required to build up their bodies, and what a delight it is to see them grow—why, every day you can see them getting bigger. A 100-pound sack of Coulson's Special Dry Chick Feed will feed 300 little chicks for the first three weeks or longer, so the cost would only be about 1 CENT PER CHICK for the feed for the first three weeks.

10th. I know one poultryman that raised 800 chicks up to two months on Coulson's Special Dry Chick Food, at a cost of 4½ c per chick, for the feed, and he only lost 29 chicks out of the 800 when I saw them, and such fine looking fellows too.

After the chicks got to be 6 weeks old, I would give them one meal a day of Coulson's Growing Chick Feed, and after they got to be two months old, I would give them two meals a day of the Growing Chick Food, and one meal of the whole wheat or cracked wheat. At about 11 weeks of age, I would send the roosters to market, and commence feeding the pullets on Coulson's Balanced Ration Mash Egg Food once a day, and whole wheat two meals a day. And I venture to say that I would soon have a flock of birds that would average me over $2.00 per hen per year profit—by feeding them Coulson's Mixed Poultry Feeds or Balanced Rations.

Ask your dealer about Coulson's mixed poultry feeds manufactured by

4 CENTS A MONTH
feed a hen Coulson's IMPROVED Mash Egg Food Every Day. Two eggs a month pays for the feed and when you get 16 to 20 eggs a month think of the money the hen earns for you.

CALIFORNIA CULTIVATOR

Vol. XXVI—No. 25 LOS ANGELES, CAL., THURSDAY, JUNE 21, 1906 Subscription $1.00 a Year

Profitable Farm Industries for Women

In no occupation is there such a variety of industries, not necessarily carried on as a business, as in the farm home. Eggs, a staple article of diet, are taken by the hatful from the barn to the house; the bees feeding from the clover field, leave the sweet honey in the hives, needing only to be gathered for the table; the sheep on the hillside are sheared to provide clothing and they furnish mutton for the table; the strawberry patch has delicious fruit for canning; the garden and the orchard furnish green vegetables and fruit for dinner without exposure to the road and the market; the vinegar is making in the barrel; the hams are curing in the dry-house. All of these good things come to the city family in a roundabout way and through several sources. The telephone is called into service, and trips are made to the market before the table and family supplies are secured. This takes much work out of the home, although the home is also deprived of much comfort that comes from having supplies fresh and in good condition. Everywhere farms are teeming with work to supply the millions of persons who are dependent on the farmer. What have women to do with all this? Shall they tend the flocks, keep the poultry, hive the bees, husk the corn, and make the butter? No matter what one's theories are, the women will do a great deal of this work on the farm. Even with hired help they will supervise and plan, and if the children help, the mothers will be the inspiration which is the motive power behind a boy and girl not too anxious to toil all day. Often she must become manager, and assume the responsibility of the farm.

This article, however, is prepared for two other classes of women—those who wish extra occupation for pleasure and relaxation, and those who want it for profit. Many women are looking toward farming or some home industry as a healthful means of making a living in place of teaching or clerical work. Here is great opportunity for a woman's talent and executive ability. She needs to employ manual labor, but so does the farmer if he carries on much of a business. Let her furnish the ability to plan, to save, to drive, to "take time by the forelock," and get some one else to lift the beehive, climb the ladder, and hoe the garden. The latter is cheap; keeping the farm accounts and learning when to do things to advantage is a rarer accomplishment, and one which she may master.

Then there is the woman who wants to take up some special industry because, in addition to her routine of housework for the family, she is desirous of adding to her personal income. If, by skill and some help from the hired man or members of the family, she would raise a hundred bushels of strawberries and make $25 thereby, and then pay that amount for washing, cleaning or some other work which is difficult for her, she is a thrifty woman. Or, a new black silk dress purchased with egg money is just as much of a pleasure as though it were earned in some other way. The trouble is that sometimes she raises the srawberries and does the washing besides.

There is an interest which attaches to farm industries because of the influence on the children. The children will not so easily comprehend large results in the aggregate which come from farming as the older people will. But they can be interested in smaller and simpler ventures, learn to know the details of poultry keeping, or pigeon raising, or gardening, and gain a large enthusiasm for the work in hand. They do not so easily become enthusiastic when they do a little of each kind of work, with no sense of personal interest and knowledge of returns. Interesting the children in concrete industrial problems will help to keep them on the farm.

Shall all the farm women engage in a large number of farm industries, or shall each woman try to make a great success in special lines to which she is personally adapted, or which her capital and farm conditions permit? She must study to see what can be done in her particular locality under present conditions of soil and climate. She must study the market to see what will bring the largest returns. If the market is always overstocked with eggs, that is not the industry for her to follow. If there is no demand for small fruits, why waste her time? It also looks like a waste of time and strength, considering the question from the standpoint of a commercial industry, for one woman to raise a few fowls, sell a few eggs, market a little honey and a few berries, sell a few pounds of butter, particularly when her neighbor does the same. Each industry brings small returns for the money and time invested, while if each were to specialize on some line to which she and her surroundings are adapted, she would secure larger returns. This does not preclude her having eggs, butter, berries and apples for her own use raised on the farm, for therein is much satisfaction.

* * *

Poultry.—Probably the most popular and uniformly profitable home industry for farmers' wives is poultry rearing. There is probably not a day in the year when the average family does not use either fowls or eggs in the preparation of food. This makes a steady and uniform demand. Moreover, the farm is an ideal place for the flocks—they have wide range and a good variety of wholesome food. Much of the food is grown on the farm, and its cost is not felt. An important part of the food is what would otherwise be waste, as table refuse, screenings, and the like. The birds are able to forage a considerable part of their food; and green stuff can be grown in abundance. Just because so much of the food comes without direct money cost, however, the farmer or his wife may not figure up whether the fowls are really profitable or not.

* * *

Squab Raising.—In the last ten years the raising of young pigeons, or squabs, has grown into a more promising business than is indicated by the appearance of a few pigeons flying in and out of the barn loft. Now houses are designed for them, and instead of ten or twenty birds, a thousand make a profitable and absorbing industry. After the buildings are secured, the business does not call for great bodily exertion, so it is well adapted to women. In many instances poultry houses have been made to serve this purpose.

In few lines are there as quick results from the first investment as in squab raising. Two eggs are laid and in four weeks' time, with some varieties, and five or six with others, the squab is ready for the market.

A good site is required for the houses—dry, well sheltered from the winds, but admitting the morning sun. The house must be clean and well ventilated, and secure from maruders; for cats, rats and mice find an entrance if possible.

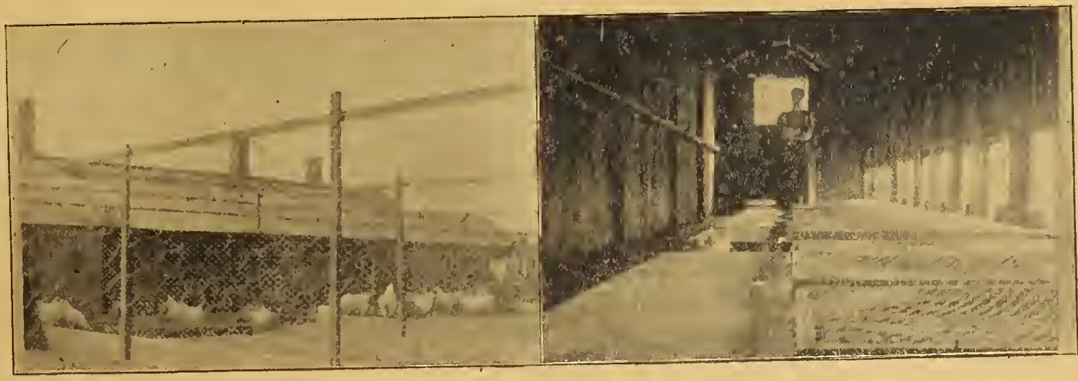
The selection of good stock is very advisable, as otherwise they only prove an expense with small returns. A good pair should yield eight, and sometimes nine pairs per year, although larger claims are made by some.

* * *

The Home Dairy.—An enormous amount of butter is made on the farms. Its quality does not average as high as it should, and as it could easily be made to average. A large proportion of farm dairy butter is sold on the market for two, three, or even five or six cents per pound less than well-made creamery butter . A small part of the farm dairy butter is excellent in quality and sells for as much as creamery butter, and sometimes more. An advance of a few cents per pound on butter throughout the year means a large sum. Three cents per pound would amount to $39 in a year in a dairy averaging twenty-five pounds of butter per week. The fact that some farm dairy butter commands a high price proves that high-grade butter can be made in the farm dairy; if any one is so skeptical as to need proof of this point.

The success of butter making, whether on the farm or in the creamery, depends first of all on the quality of milk. Fortunately, the dairy farmer who makes his own butter has this influence entirely under his own control. But improper care and ripening of the cream before churning are more responsible for the low average price of farm dairy churning than any other cause. This part of butter-making requires very close attention. The temperature must be watched and held at the point most favorable for the growth of those organisms which form lactic acid or cause milk and cream to become sour. When the cream has ripened enough or developed sufficient acidity, it should be cooled and held several hours before churn-

Continued on Page 594



A Woman's Poultry Plant.

Deciduous Fruit Culture

COLORING OF THE APPLE.

It would certainly be a matter of great advantage to have a few of the questions that the farmer and fruit grower have to do with definitely settled once for all. Now as to the matter of the coloring of the apple. If the apple growers this side of the mountains are to compete successfully with the favored districts elsewhere, this is the principal question that stares him in the face: Can we grow an apple here with as good a color as elsewhere?

It seems to be generally accepted as a fact that the mineral element in the soil required by the tree to enable it to give full color to its fruit is the potash element. It is an equally accepted fact that our soils on the west side contain, as a rule, less of this element in an available form than is the case on the east side. This would seem, indeed, to be a self-evident fact, as our best soils here are of alluvial nature, and this element in the most soluble form would, in the nature of things, not be found in the washed lands. It is admitted by all the authorities that this most valuable element in ordinary stable manure, exposed to the leaching influence of ordinary rains, is very soon washed away and lost. In the dryer regions of the country there should ordinarily be an excess of potash in the soil.

But that there is a deficiency of the potash element in our soils of the Pacific Coast is a totally unfounded assumption. The growth and perfection of the crops produced here prove the contrary to be the fact. Though that it is in all probability in a less soluble and available form here would seem to be a plausible theory as above set forth.

How could any one know that there is a deficiency in our soils here? The crops don't lead us to think so. We admit that such is the impression that the common "penny a liner" writer gives in print concerning the fact. But the teaching from such sources is as apt to be misleading as otherwise, as most practical, thoughtful farmers know.

Let some one send a sample of his soil in the State College or University, asking for an analysis, and statement as to whether there is a sufficiency of potash in it to ensure growth of good crops. He will surely by next mail receive a printed circular setting forth that no chemist by analysis could answer his question at all. The growing of crops alone could determine. There was a time, perhaps, when our agricultural professors would pretend to say as to deficiency, and to send prescription (as a full-fledged quack doctor might do) of amount of some element to be added to bring soil up to a desired standard. But that time is long since passed (with, perhaps, the exception, it may be noted, of some in the department of agriculture at Washington City, who do not seem able to resist the temptation to exploit themselves when favorable opportunity presents.)

And now as to the coloring of the apple actual existing facts will tell, and it is fully settled that where irrigation is practiced they color well. On the east or west side of the mountains they do not color well without water in the dry months. The actual fact, tested for at least ten consecutive years in my own orchard here, demonstrates this fact as to the Puget Sound region. Three rows in my orchard trees, nearly 50 in number, are on a lower level than the balance of the orchard land, and subject each July to its soil being filled, even a few inches above the surface usually, with water from seepage from the annual freshet of the river. The fruit upon these trees has invariably a brilliant coloring, while that of the adjoining trees on the higher (3 to 5 feet) land fail to color; the soil itself being exactly similar. The Northern Spy becomes a blood red apple with the water; without it a dingy green with only a faint touch of color on a portion of the fruit. The Baldwin, with the water, is an all-over red apple. Without it it might pass for a white-fleshed Rhode Island Greening. But an Eastern man would not know it from a Baldwin.—J. F. C.

SERMON ON FIGS.

Charles Chambers, secretary of the Fresno park commission, is a firm believer in the growing of figs in this country. He thinks that our horticulturists should give this important industry more attention. He is an advocate of the Smyrna and also the Mission figs, and in the course of an interview said that the fig which was brought here by the old Spanish priests has a new use. The black fig is made into coffee, and there is a firm in San Francisco which pays out good money in Fresno in the purchase of black figs for the manufacture of this coffee. Chambers is an enthusiast on the fig question, and had this to say about the trees and the fruit:

"It seems to me that an industry which would prove profitable has been overlooked by the horticulturists in this country. Much money has been expended in securing varieties of white figs such as the Adriatic when though it has taken kindly to the soil has its drawbacks. The white Adriatics sour badly on the trees, especiablly during wet winters, and two-thirds of the figs planted in Fresno are white Adriatics. The reason of this is that it was the first fig grown on extensive scale here, and it was thought to be the fig of commerce.

"It seems strange that when growers had a fig right at their doors they should have neglected it and experimented with a fig of which they practically knew nothing. The fig to which I refer is the black fig, known as the Mission fig. This fig was introduced into the country by the Mission fathers, who among their other accomplishments were horticulturists. This fig was largely planted at the various missions and cuttings were given to the Indians to plant around their rancheras. The fig took to the soil and the largest and most prolific of these Misison fig trees is at Palm Springs on the Colorado desert. They ripen there during the first days of May, and I have been told that when Mrs. Herman Oelrichs was married, Mrs. Fair, her mother, paid about 50 cents a fig for the wedding banquet.

The chief advantage of the Mission fig is that it does not sour upon the trees and is indifferent to wet winters. It is a prolific bearer, the fruit is large, purplish in color and with a delicate bloom which makes it attractive for table purposes. The only trouble with the Mission fig is that the people in the East are educated up to the white fig and might not take kindly to the black dried fig. There is a firm in this city which once thought of drying the black fig and packing it along with the white fig, so as to make a checkerboard as it were. By this means it was hoped to introduce the black fig in the East and so win for it favor and thus create a demand.

"There is big money in the growing of the black fig, which should be brought to the notice of the land owners. A black fig has other uses besides being eaten at the table as fresh fruit and being dried. Coffee manufacturers have discovered a use for the black fig. It is dried in the usual way, but not much care is given to it, and it is shipped in sacks to the coffee man. The manufacturer converts this crudely dried fig into a fig coffee, which is extremely nutritious, and there is a big demand for this drink. There is a firm in San Francisco which has been using this black fig for this purpose. I will give you an instance of the profit there is in the cultivation of the black fig. W. B. Bannister of this county has 40 trees and he has sold the dried fruit to the San Francisco coffee manufacturers for 5 years at an average net return of $6 per tree or $240 for 40 trees, which is a good return. This means $258 to the acre when planted 30 feet apart.

I would advise that instead of planting these trees in orchard form to use them as border trees and for lining avenues, and would be more profitable than planting eucalyptus or similar non-producing trees. For instance, a man having 40 acres of land he could easily plant 10 acres of figs on this 40 acres and not encroach upon the land proper. That would mean the planting of 480 trees, which bringing in $6 per tree, would give him a net return of $2680. The tree grows luxuriantly and rapidly and requires little or no care and would flourish on the ditch banks where the Adriatic would sour.

"Parties who still adhere to the white variety as the fig of commerce should, in my opinion, select the Smyrna, as it is the true fig of commerce and is the tree which is planted all through Asia Minor, which is the home of the fig. A great deal depends on the fertilization of this fig. When properly done it is a heavy bearer. The Smyrna is a delicate tree and requires constant attention and vigilant care, especially during the fertilizing period. If neglected during this time the crop will be light. This tree can not be left to take care of itself, and the man who abandons his grove for the pleasures of the sea coast during the summer months will find that he is without an income.

"However, if the grower will take the necessary care of the Smyrna they will find that it is one of the most profitable fruit trees to grow. The fig is always in demand and I do not think that the market can ever be overstocked. I also have a great belief in the Mission fig, and I have not the slightest doubt that when this fig is once established in the eastern market it will find a ready buyer at all times. No disease has as yet shown in any of the figs and this is a desideratum to all fruit growers."

TREE TOMATO.

In less favored climes the fruit of the tree tomato (Cyphomandra betacea.) is esteemed so much that the plants are grown in specially constructed glass houses. In California we have many localities where it can safely be grown out of doors, yet few, if any, have tried it other than as a decorative plant for tropical corners.

Practical Farm Science

BEE VEILS.

A beginner should never undertake to hive a swarm or work with bees without being well protected by a veil and gloves. An experienced apairist works often for months without either veil or gloves, and, indeed, they are a nuisance. The apairist, however, knows the nature of the bees, and knows how to manage them to avoid stings; yet, it is really folly not to use a bee veil at all times. It can never be known what accident may happen, and result seriously. If the veil is not worn constantly over the face, it should at least be kept over the hat, so that it can be drawn down upon a moment's notice when necessary. For years I had no use for a veil about my face. It was in the way, and did not allow a free circulation of air, so beneficial in a hot climate. Being so overly tall in person, it was also quite an annoyance, for limbs catch on the veil, especially when in a rush. But after experiencing several stinging scrapes, and working large apiaries where the veils had to be worn, and after several instances, more or less serious in their nature, of stinging accidents had come under my observation, it was decided best to use a veil at all times and places; hence I prefer to wear a veil whenever among the bees. A good veil does not cost very much; and if made at home, the cost is only a trifle. I prefer black cotton tulle with a silk facing only, for cheapness, and the silk face is not really necessary except for minute work. For rough work the tulle is all right, and black can be seen through better, and does not blind the eyes as white does.

Bees are certainly a help to growing fruit in that they aid in fertilizing, and while they are working in the blossoms other insects do not have an opportunity to injure them.—C. R. W.

ANTS AND FRUIT TREES.

The failure of fruit upon fig, orange and other trees is often apparently due to the presence of ants, which introduce and propagate various pests to the destruction of all new growth. In cases of this kind after thoroughly cleansing the tree either by means of spraying or, if the tree permit it and the attack is not too far advanced, by judicious removal of the affected branches, the pest may be controlled if the ants can be prevented from further invasion. Constant experiment has been made during the past two or three years to exclude ants from certain affected fig trees, but until recently little success was attained in consequence of the untiring persistence of these persevering insects. Many methods were employed, some of which were found destructive to the trees, and others were rendered more or less useless on account of the time and constant attention required. The most satisfactory and probably the simplest device has been found to be a strip of fur or goat skin tied closely around the trunk in such a way that the hair points towards the ground. Various viscid and corrosive preparations have been tried, but these for various reasons have not been satisfactory. Very good results were obtained by rubbing a band of chalk (which needs constant application), eight or ten inches wide around the tree, across which the ants have difficulty in passing. By the use of either of the methods suggested, there is no reason why even growers of large numbers of fruit trees should not be able to protect them from the pests which are introduced and spread by the ants.

INCREASING HUMUS.

There are three general methods of supplying humus to the soil. The first and best is the addition of stable manure. When properly managed it adds large quantities of both plant food and humus. But manure is not always available. When such is the case, the best thing to do is to make it available. Raise more forage, keep more stock, and make more manure.

But this takes time and capital, so that other means are necessary. When stable manure is not to be had, we may plant crops for the purpose of turning them under, thus adding large quantities of humus at comparatively little cost. Plowing under green crops is called green manuring. Under certain conditions this is an excellent practice.

A third method of adding humus is to grow crops like clover and timothy. These crops are usually left down for two years or more. During this time their roots thoroughly penetrate the soil. Old roots decay and new ones grow. When the sod is plowed up, more or less vegetable matter is turned under. This, with the mass of roots in the soil, adds no small amount to the supply of humus.

THE USE OF LAND PLASTER.

The chemical analysis of gypsum or land plaster shows it to be composed of 46 per cent of sulphuric acid, 33 per cent lime and 21 per cent water. It has been used as a fertilizer for many years, Benjamin Franklin being the first to introduce it in this country. Of its great efficacy as a fertilizer we have the authority of Liebig and many other distinguished agricultural chemists. The experience of practical farmers gives ample proof of its value in agriculture. Liebig, regarding its efficacy, says that as a general thing vegetation absorbs less than one-eighth of its weight through its roots from the soil, the remaining portion being absorbed through its leaves from the atmosphere.

But gypsum or land plaster is not, strictly speaking, a manure; it only attracts ammonia and other fertilizing gases from the atmosphere through the leaves and on to the roots for the use of plants. In this connection, practical experience has done more than aught else in directing the attention of agriculturists to the great use of plaster in the matter of fertilization. Scientific men, while they all agree as to the efficacy of plaster, differ as to its manner of action. This much, however, is agreed upon by all hands, and that is that plaster in its natural state is a compound of sulphur and lime, and it is pretty generally admitted that the winds passing over the surface of ground sown with plaster, freighted as they are with ammonia arising from decaying vegetable matter, barn-yards, hog-pens and the like, the ammonia dissolves the plaster, thus freeing the sulphur from the lime, and in doing so, immediately unites with the sulphur and forms the sulphate of ammonia, one of the most valuable fertilizing agents known.

NITROGEN FIXATION.

The notable progress which has recently been made in the development of commercially successful methods of fixing the free nitrogen of the air, and thus making it available for agricultural and other industrial purposes, should go far toward reassuring those who are disposed to view with alarm the rapid exhaustion of the world's principal known supply of combined nitrogen, namely, the nitrate deposits.

The rapidly increasing demand (which has been from less than 200,000 tons of nitrate in 1870 to over 1.500,000 tons in 1095) and the steadily diminishing supply have stimulated unusual activity in efforts to apply the discoveries of science to the solution of the great industrial problem of finding a practical means of maintaining a cheap and reliable supply of fixed nitrogen.

The encouraging results yielded by the Frank and Caro calcium cyanamid process have already been referred to (E. S. R., 15, p. 423). Further developments in the application of this process have fully justified the promise of the earlier trials, and factories have been built in Italy, Germany and elsewhere to test the process on an extensive commercial basis. The numerous experiments which have been made to test the fertilizing value of the so-called lime nitrogen (Kalkstickstoff) prepared by this process indicates that when used with proper precaution and under certain restrictions the product has a fertilizing value in general but slightly inferior to that of nitrate of soda and somewhat superior to that of sulphate of ammonia. The results of hundreds of such experiments on a great variety of soils and crops are given in a recent 120-page report issued at Rome.

Improvements are constantly being made which increase the efficiency of the process and lessen the cost of the product, and which encourage the belief that where cheap water power is available this process can be made to yield a product capable of competing successfully with nitrate of soda in the markets of the world.

The most recent and most notable development in the line of fixation of the nitrogen of the air for commercial purposes is, however, in the nature of a return to the earlier methods of direct oxidation by means of electric discharges. Prof. K. Birkeland of the university of Christiana, Norway, and S. Eyde, a Norwegian civil engineer, have devised a process for greatly increasing the size and efficiency of the ordinary electric arc, so that oxidation of the nitrogen is more rapid and is accomplished with much less expenditure of electric energy, and hence at less cost than in preceding processes.

Irrigation and Pumping

DUTY OF WATER.

The conditions affecting the amount of water required by any particular crop are numerous, and a change in any one or a number of them will change the water requirement to a considerable extent. Under constant conditions, however, it is to be supposed that the amount of water required is also constant. The most important of these determining conditions are:

1. The quality and condition of the soil. A gravelly or sandy soil will require more water than a loam, on account of greater percolation, and a well tilled soil will lose less moisture by evaporation than will one in a poor condition of tilth.

2. The depth of the ground water plane below the surface. If this is quite near the surface, no irrigation may be required, as upward movement of water due to capillarity may supply sufficient moisture for the plants. On the contrary, if the ground water plane is found at great depth, the soil will lose large amounts of water by downward percolation which would otherwise be available for plant growth.

3. Average humidity and temperature of air and temperature of soil during growing season. These conditions affect evaporation from the soil and transpiration from the leaves of plants. In the arid regions, where the amount of moisture in the air is relatively low and the temperature high, the loss of water from the sources mentioned is quite large and is further increased in certain localities by winds.

4. The slope and general configuration of the surface of the field. This affects the surface and underground drainage and consequently the amount of water which must be supplied to make up losses in the soil moisture.

As distinguished from the amount of water required, the amount of water actually used depends necessarily upon the above conditions, and also upon the skill and judgment of the irrigator; the condition of the land, whether level or uneven; the efficiency of the distributing system; the rainfall during the season; and not least important, the character of the water right and the amount of water available. It is an observed fact that the more water available, the more will the irrigator apply to the land.

The average irrigator in this state being a highly practical person, seldom gives much thought to the moisture requirement of the particular crop which he is watering, nor does he often trouble himself to practice economy in the use of water. The application of such a quantity of water to a crop as will bring the largest yield for a given amount used, is a question which however important to irrigators in thickly settled and inadequately watered portions of the West, has up to the present time been only of speculative interest to the Wyoming ranchman. They have rarely realized more than $10 per acre yearly from the yield of their irrigated lands, and the care and trouble necessary to make better use of the water has not been warranted by the value of the water which might be saved or of the increase in yield of crop which might be produced. The time is not distant, however, when present practices must give way to more advanced methods. Wyoming can boast of being more bountifully supplied with water than any State in the arid West, yet its comparative abundance should offer but small excuse for wastefulness in its use. In many portions of the State, neither land nor water has as yet the economic value which they are certain to acquire later, but already in certain sections of the State the entire normal flow of the natural streams is appropriated; ligitation between conflicting rights, local and interstate, is threatening, and the only way in many instances in which it is possible for a man to extend the area of his cultivated land is to make more careful use of the water which he now controls. It is no exaggeration to say that if the area now irrigated were watered with economy and with a more careful insight into the needs of land and crop, the cultivated area could largely be increased, probably by one-fourth or one-third of its present area. This applies particularly to the irrigation of hay land. The present practice of keeping the land in a thoroughly soaked condition for from two to four weeks at a time cannot but result eventually in ruining the land and producing growths of plants of doubtful value as forage. The economy in using water of any appreciable value in producing the hay crops upon these lands is very doubtful. To run a mowing machine over probably 500 acres of irrigated land in order to cut about 300 tons of hay certainly shows a ridiculously low valuation, both of land and water, as measured by the crop produced.—B. F. Fleming.

A GREAT IRRIGATION PROJECT

A great irrigation project, involving an expenditure of about $25,000,000 has been authorized by the Secretary of State for India. The area commanded by the canals is about 6,250 square miles, although only a small part of it will be reached for a number of years to come. In this area, it is estimated, about 3,000 square miles will be irrigated. The water will be taken from the Jhelum river, in which there is now unappropriated at the site of the headworks a flow of 5,600 to 7,900 cubic feet per second. It is believed that the investment of public funds in these works, great as the sum may be, is well warranted by the economic advantages of the undertaking and the reasonable assurance of ample interest payments.

IRRIGATING SEASON.

A question of no little importance to the framer of irrigation law and to the designer of canals and reservoirs is the length of the irrigation season, or period during which water should be supplied by canals for use upon lands under them. This period varies, of course, with the locality. In the warmer portions of the west it may extend over the entire year.

With the Citrus Growers

BY J. W. MILLS

PLANTING A CITRUS ORCHARD

The plan of planting a citrus grove should not be any different from that of any other orchard when the trees are to be approximately the same distance apart. There is nothing gained by planting on the septupal plan, six trees in a circle with one in the center, over the system of planting in squares. The space occupied by the tops of the trees does not indicate the manner in which the roots are distributed in any kind of an orchard. The roots will fill the soil in a citrus grove alike whether the trees be planted in squares, diamonds, or septupal. This has been fully demonstrated and this should settle for all time the question of the plan. Every practical farmer knows that it is much easier to cultivate an orchard that is planted in squares than when planted any other way. These remarks apply to orchards to be planted in straight rows. When the orchard is to be planted on a hill side whose slope would cause cutting out of the irrigation furrows, it is more profitable to plant on contour lines. This plan is being followed by the most careful growers who have land so situated that it works to advantage. This plan does not make cultivation more inconvenient, neither does it detract from the appearance of the orchard in fact it removes the artificial effect of straight rows, giving the plantation the appearance of having been cut out of a natural grove. The great advantage gained is in the establishment of irrigation furrows which will carry the water along the rows on a better grade than is usually possible on comparatively level ground where the trees are planted in straight lines.

The proper distance apart at which orange trees should be planted is not now and perhaps never will be settled. Individual opinions differ on this point and it is not a vital question. Trees should not be planted so close that they will crowd when 15 years old, neither can they be so profitably grown when their outer branches are ten feet apart at 30 years, unless the grove is planted for the express benefit of the following generation. About 20 to 24 feet apart is a good range of distance.

It is generally accepted that orange or lemon trees should be planted in the late spring or early summer. This we think is immaterial if the best trees are selected in the nursery. Trees which are planted in April and have the tops entirely removed at the time of transplanting from the nursery will not make as good trees or go through the winter as well as good trees that are carefully selected, balled and planted with special care as late as the middle of July. Mr. J. H. Reed of Riverside first conceived the idea of transplanting the trees from the nursery without removing any of the top excepting the ends of the soft growth. The trees are carefully selected, those with large tops and heavy stems being preferable. The trees are well soaked in the nursery before removing so that they may be properly balled. They are taken directly to the field and placed in the holes previously made for them. The holes should be at least two feet deep and two and a half wide. The earth should be filled in around the ball so that the trees stand in the holes at the same depth as they did in the nursery. The soil should be settled around the trees by water. The ground should be well soaked all around the newly planted tree so that it will have a surplus to draw on till the following irrrigation. Of course thorough cultivation should follow. We have found by practice that if the trees are taken from the nursery and stacked together under a partial shade as is afforded by a lath house four or five days, keeping them moist enough to prevent wilting, that they will recover from the loss of the roots suffered at the time of digging. If they are slightly wilted when placed in the holes and the water is turned on they will take up the water more rapidly than when thoroughly soaked just before planting.

Mr. Reed's directions after planting are as follows: "A small amount of fetilizer is applied soon after planting for the young roots to use when they first start out from the balls. A pure bat guano with a big percentage of nitrogen, about three-fourths of a pound to the tree, has been found to give the best results, but any commercial fertilizer rich in nitrogen or animal fertilizer, if placed properly and kept moist, answers well. It is applied in trenches each side of the ball, at right angles with the irrigation furrows and reaching to them. They may be made by a deep furrow and deepening with a trowel to ten or twelve inches. The material is carefully distributed and slightly mixed with earth at the bottom of the furrows; the water from the irrigating furrows keeping this always moist, it is available as soon as reached by the rootlets. This also tends to deep rooting. Thorough irrigation should follow planting every twelve or fifteen days through the summer. The whole space between the rows should be thoroughly and deeply wet—not merely a narrow strip on each side of the rows. I have traced roots that have grown during the first summer over six feet from the tree, and these should be well supplied with moisture at all times."

The advantage claimed by Mr. Reed is that the tops of the trees are retained and they are made use of immediately. The large leaf surface is brought into use at once, which means that instead of the reserve force of the tree being drawn upon to start a new set of leaves and branches the leaves retained enter at once upon the work of further building up the trees.

Orange trees planted according to the Reed system have tops that are from twice to four time as large when they start new growth as trees planted after the ordinary manner are after they have been planted six months. Trees planted by the Reed system have produced ten boxes of oranges per acre the second year and one hundred boxes per acre the third year.

We claim that trees planted late and as described above will stand the cold of the following winter better than trees planted on the old plan which have made an entirely new top of soft growth.

. Valencia Late Orange Trees .

We have a limited number of Valencia Late Orange Trees, 2-year, ¾ inch and up, running up to 1½ inch. on which we are making especially low prices, as we wish to move this stock this season. We have just sold to the largest and most experienced planter in Southern California a large number of trees to replant those that he had bought from another nursery, and he admitted that we had much better trees than he could secure anywhere else. As a 2-year-old tree will bear one year sooner than any 1-year tree, and as our stock has not been culled over, we believe that at our present prices they will produce enough more than any 1-year-old tree offered to more than pay the total price we ask for them. It will pay you to see these trees before you buy, as the amount of Valencia Late trees of any age unsold is very limited; it will pay you to write today, as tomorrow may be too late. We furnish these trees from our nursery either at Glendora or Riverside. Also a limited amount of Lemons, Seedless Grape Fruit, and other varieties of Oranges.

Redlands Nurseries, E. I. Martin, Prop., Redlands, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

THE COTTONWOOD.

The cottonwood is perhaps the best of all our poplars as a single specimen. It makes a noble tree, spreading its gray branches far and wide. But like the aspen, it is cheerful and restive. One is not moved to lie under it, as he is under a maple or an oak. Its leaves rustle with the lightest movement of air. The ripple of its foliage alway recalls to my mind the play of wavelets upon a pebbly shore. The day is never so dark, but the cottonwood reflects a flood of light.

Some of the forms of the black poplar of Europe are especially satisfactory for the production of lively effects in planting. Of these none is better than the form known to nurserymen as Populus elegans. It has a most pleasing light and tremulous foliage, the effect of which is heightened by a twiggy character of growth and a reddish cast to the leaf-stalks and young shoots. It is an elegant tree and well adapted to planting in front of heavier foliage in the most conspicuous portion of the grounds.

Some of the silver or white-leaved poplars produce the most striking contrasts of foliage, especially if set near darker trees. Bolle's poplar (Populus Bolleana of the nurseries) is one of the best of these trees. Its habit is something like that of the Lombardy. The upper surface of the deeply lobed leaves is dark dull green, while the under surface is almost snowy white. Such emphatic trees as this should generally be partially obscured by planting them in amongst other trees so that they appear to mix with the other foliage, or else they should be seen at some distance. Other varieties of the common white poplar or abele are occasionally useful, although most of them sprout badly and may become a nuisance.

NATURAL GARDENING.

In the artificial adornment of grounds by means of plants, nature is our best instructor. From her we learn the use of grass, flowers, vines, shrubs, and trees, and how to combine them to the best advantage. By growing together for ages, the various classes and species of plants have developed forms, habits, and requirements which enable them not only to live and thrive in harmony, but actually to assist one another.

Man should first provide for his necessities, then for comforts, and finally for pleasures. In a new country such as ours, the expenditure of time and means for the adornment of grounds has naturally received too little attention. The people have been necessarily concerned with acquiring lands and buildings. But a stage of development has now been reached when Americans should give more attention to the embellishment of their home grounds.

BALSAM.

A native of India, the garden Balsam loves hot sun, rich soil and plenty of water. The young plants are quick, sure growers, and from seed sown in the open ground in May soon form handsome bushes thickly massed with large, rose-like flowers. Transplanting two or three times has a tendency to dwarf the plants into better shape and to make the flowers more double.

BEAUTY OF FLOWERS.

While flowers are primarily utilitarians in purpose, the end is attained by attractive and alluring means. The beauty, fragrance, and sweetness of the flower are not vain attributes; each is designed for a suitable purpose. The bright colors are the gala-day attire of these natural fairies to attract and allure the passer by, be he insect, bird, or man. The perfume wafted upon the still night air suggests the whereabouts of the fragrant night-blooming flowers to moths and other night-flying insects, while the cups of honey at the base of the petals hold a reward for those who have heeded the signal of the color or the odor. The pot of nectar is a sufficient reward for the insect, and the transfer of pollen from anther to stigma by the clumsy but welcome guest is the end for which all this beauty, fragrance, and sweetness have been produced.

Beautiful plants and flowers naturally grouped are pleasing because they are restful. Association with nature is soothing because the crudities of man's invention in which friction is such a large factor are all eliminated. The sounds in the woods are musical, harmonious, and rhythmical, soothing and pleasing in effect, while the colors are beautifully blended, holding the eye and the attention without effort and without fatigue. Nature in such moods is restful.

AGERATUM.

"For strengthening the garden's color forces in blue, no annual is so good as the ageratum." Though ordinarily used in bedding and borders in contrast with such plants as geraniums, perillas, amaranthus, etc., the rose, white, and blue ageratums are exceedingly attractive when mingled with alyssum, candytuft, and similar plants. They grow well upon almost all soils and through a wide range of climate; for that reason many combinations with them are possible. The plants are neat, bushy, erect, with a continual profuse clustering of pretty brushlike flowers throughout the season. The dwarf blue sorts make fine borders and are much used where contrasting color effects are desired. For early bloom the seed should be sown in cold frames or in boxes in the house early in the season—March—but for summer and fall bloom the seeds may be sown in well prepared beds in the open. Seeds sown in August will produce good plants for winter flowering.

ZINNIA.

The zinnia is very easily grown from seed sown in the open ground. When sown in April the plants will bloom abundantly and continuously through the entire season. Of late great improvements have been wrought both in the color and form of the flower. During the month of August Zinnias are at their best. To secure large flowers and a profusion of bloom the plants must be given ample room for full development, as well as an abundant supply of food. Strong, rich soils suit the Zinnia. If the seeds are sown in a dwelling house or in a hotbet in March and the young plants are pricked out once or twice before they are placed in their permanent situations more satisfactory results will be secured than from outdoor-sown seeds unless equal care in thinning or transplanting is given. The plants can be used for groups, beds, borders, garden lines, and summer hedges. Their average is 1 1-2 feet.

SNAPDRAGON.

The Snapdragon is one of our finest perennials, flowering the first year as annuals. Its bright-colored, curiously formed flowers always excite interest, and among the newer sorts are flowers of a great variety of colors and markings, some of wonderful brilliancy, others soft and pleasingly shaded, and still others with a velvety appearance. Their rich spikes are beautiful for cutting and keep fresh a long time. From seed sown in the open ground plants will bloom in July and August. For early flowers sow under glass in February or March and transplant into beds of warm, dry soil moderately enriched. Average height, 1½ feet.

BEGONIAS.

Begonias are easily grown from seed, especially the semper-florens class, which bloom when only one or two inches high. They make fine bedding plants, giving a mass of color the entire season; stand the sun well; and require only a light, rich soil, and plenty of water to make a fine show. The foliage is almost as beautiful as the flowers, a large proportion being shaded bright red. The flowers are white, shades of rose and pink, crimson and scarlet or white with red or pink margins. They are easily grown from seed, bloom early and unceasingly, and are the most brilliant plants for pots or bedding that can be found.

ARCTOTIS.

A remarkably handsome new annual from Southwest Africa. It forms much-branched bushes 2 to 3 feet high; its flowers are large and showy, being pure white on the upper surface, embellished with yellow zone, the reverse of petals pale lilac-blue; altogether a lovely flower, of the easiest culture, and flowering in constant succession from early summer until late fall.

Kellogg's Ant Paste

Azusa, Los Angeles County, Cal., Dec. 8, 1905.
Mr. Kellogg:

Dear Sir—After giving your Paste a thorough trial I am now prepared to say of a truth that it has effectually rid my premises entirely of this most annoying pest. They were under the house, in the house, up under the roof, on the roof, in the ceiling, in the bath room, in the cupboard, in the pantry, in the hanging safe, the grounds around the house were literally black with them, and this condition had existed for years, until we were almost driven out. They were continuously at work, nights, Sundays and holidays, summer and winter, rain or shine, but now, thanks to your discovery, we are entirely rid of this trouble, and I sincerel hope that any who may be troubled in like manner may be fortunate enough to possess themselves of this Paste and I assure them that in process of a very short time they will clear their premises of the greatest source of annoyance that could possibly infest their home.

Hoping that you may succeed in getting every one supplied with this Paste.

We remain, yours most obedient.
JOHN AND HATTIE SHELTON.

In the Vegetable Garden

BY ERNEST BRAUNTON

BEETS.

The red garden beet may be grown in any good soil, but rich sandy loam will give the best results. Sow the seeds in the spring as soon as danger of frost has passed. Beets should be planted in drills 12 to 18 inches apart, and when the plants are well up they should be thinned to 4 or 5 inches in the row. If desirable to plant in rows 3 feet apart for horse cultivation, the seeds may be sown in a double drill with 6 inches between, leaving 30 inches for cultivation.

Two ounces of beet seed are required to plant 100 feet of row, or 5 pounds to the acre. As a rule each seed ball contains more than one seed, and this accounts for beets coming up very thickly. The seed should be covered to a depth of about 1 inch. For a succession of young beets during the summer, plantings should be made every four or five weeks during the spring months. Beets intended for winter storage should not be sown until late in the summer, the crop being harvested and stored in the same manner as turnips. Sugar beets are often substituted for the ordinary garden beet, especially for winter use.

Beets are used for pickles, or boiled, sliced and fried in butter, adding a little vinegar before removing from the fire. The young plants are used for greens.

POTATO CULTURE.

Considered from the farmers' standpoint the potato plant is a machine for the production of starch, the principal constituent of the potato, together with the small amount of other substances combined with it in these enlarged under-ground stems, which we use as food. The raw material for the potato substance comes from the soil water, taken up by the roots and the gases of the air. While the sunshine and other conditions are favorable these substances are organized in the leaves, and gradually pass downward, and accumulate as starch below ground. Since such important work is done by the slender fibrous roots and the expanse of leaves exposed to the sun. the necessity of keeping these organs in good working condition is easily seen. And theoretically one might say that the more water passed through the plant from the roots, and the more sunshine received by the leaves, the more potatoes produced.

The ideal conditions for healthy growth are loose, rich, well-drained, but moisture-retaining soil of moderate coolness, rich in humus, and used in rotation with legumes. Heavy soils are not so good as light and need to have careful management. Constant moisture is the first consideration, but wet soil is equally as fatal to good growth as drought.

After considering suitability for desired use in earliness, production and quality. the variety planted should be selected for resistance to drought, disease, insects, etc. And if it is desirable to grow one's own seed each season, the stronger, more productive and resistant plants should be picked out for seed, this keeping up or improving the seed tubers, has more to do with their success than the size of the tubers used for seed, or how they are cut.

Partly rotten potatoes or those showing imperfections, indicating lack of vitality, should never be planted, as they are apt to communicate disease to those that grow from them, and the cleanest, most healthy-looking seed possible should be used. One poor potato saved by planting it is usually equivalent to throwing away a whole hill.

The weakening of the seed by too early sprouting has to be carefully guarded against, and may be done by careful storing, or by the use of northern seed. The object of the starch in the potato is to feed the young plants until they can get well rooted, and they must suffer if it is exhausted by sprouts that are lost before planting. The cut seed may be injured by drying out, or heating, if kept more than ten days before planting. The partly dried pieces withstand rot better if planted in wet soil.

EGGPLANT.

The plants for this crop should be started and handled in the same manner as described for the tomato. After the weather has become settled, and the ground quite warm, set the plants in the garden in rows 3 feet apart and 2 feet apart in the row. The soil best adapted to the production of eggplant is a fine, rich sandy loam and should be well drained. Cultivate freely and keep the plants growing rapidly. Many growers believe that fresh stable manure should not be used in connection with the growing of eggplant and that the land should not contain unfermented vegetable matter to any extent.

Eggplant is used in several ways, among which are the following: Peel and cut into slices one-half inch thick, soak in salt water one hour; boil until tender; then coat with rolled crackers or flour and fry in butter or fat. Another method is to steam or bake the eggplant whole and serve in the shell, the pulp being eaten with salt, pepper and butter.

NON-FRUITING OF MELON VINES.

Many practical gardeners hold the opinion that some plants, like the cabbage, and also pumpkins and melons, head and fruit better when old seeds (two to three years of age) are sown. This is an exception to the general rule, which shows that fresh seeds possess a higher germinating power and produce more vigorous plants. A French experimenter, Cazziola, found that melon and squashes raised from fresh seed bore a larger proposition of male (staminate) than female (pistillate) flowers, while older seeds bore more female than male flowers. This may be the reason of the scarcity of female flowers in certain cases. It is well known, however, that male flowers of plants of the melon and squash tribe usually appear five or six days before the female flowers, and also that they are much more numerous than female flowers. In this way while plenty of pollen is provided, self fertilisation of the female flowers by the male flowers of the same plant is checked, and cross fertilisation, aided by the agency of insects and wind, is made easier. As a general rule, a practical result of cross fertilisations, is that more vigorous and hardier subjects issue. Some gardeners affirm that when growing pumpkins or melons it is advisable to mix a small proportion of new seed with the older seed, to provide vigorous and leafy vines with an abundance of pollen.

CULTIVATION OF GARDEN CROPS.

Frequent shallow cultivation should be employed for most garden crops, and during dry weather the depth should not exceed two inches. By keeping the surface soil well stirred what is termed a "dust mulch" is formed, and while this layer of finely divided soil will become quite dry it prevents the escape of moisture through the pores of the soil. A mulch consisting of fine manure, clippings from the lawn, or any similar material, spread to a distance of 10 or 12 inches around the plants will preserve the moisture; but the mulch should not be so heavy as to exclude the air.

A crust forming over the soil after a rain or watering is detrimental to plant growth and should be broken up as soon as the land can be worked. To determine when the soil is sufficiently dry for cultivation, apply the usual test of squeezing in the hand. Sandy soil can be worked much sooner than clay soils after a rain. Too much importance can not be placed upon the matter of thorough cultivation of the garden, and if the work is promptly and properly done there will be little difficulty in controlling weeds.

IMPORTANCE OF THINNING.

Where plants are not to be transplanted twice, but remain in the plant bed until required for setting in the garden, it may be necessary to thin them somewhat. This part of the work should be done as soon as the plants are large enough to pull, and before they begin to "draw" or become spindling from crowding.

When thinning plants in the plant bed it should be the aim to remove the centers of the thick bunches, leaving the spaces as uniform as possible. When thinning the rows of seedlings in the garden the best plants should be allowed to remain, but due consideration should be given to the matter of proper spacing. Failure to thin plants properly will invariably result in the production of an inferior crop.

THE SEED BED.

In the broadest sense the garden is a seed bed, as the seeds of many crops are planted where they are to grow. As the term "seed bed" is used here it refers to some specially prepared place for starting plants. from which they may be transplanted to their permanent positions in the garden. The location of an outdoor seed bed should be such that it may be conveniently reached for watering, and it should be naturally protected from drying winds.

Good soil for a seed bed consists of one part of well-rotted manure, two parts of good garden loam or rotted sods, and one part of sharp, fine sand. The manure should be thoroughly rotted, but it should not have been exposed to the weather and the strength leached out of it. The addition of leaf mold or peat will tend to make the soil better adapted for seed-bed purposes. Mix all the ingredients together in a heap, stirring well with a shovel, after which the soil should be sifted and placed in boxes or in the bed ready for sowing the seed.

Weed seeds and the spores of fungous diseases that are present in the soil for a seed bed may be killed by placing the soil in pans and baking it for an hour in a hot oven.

PARSLEY.

After soaking the seeds of parsley for a few hours in warm water, they may be sown in the same manner as celery seed and the plants transplanted to the open ground. In the south it will thrive in the open ground during the winter, but it can not withstand the heat of summer. The plants should be set in rows 12 inches apart and every 4 inches in the row.

The leaves of parsley are used for garnishing around meats and for flavoring soups.

The latest vegetable novelty is the black potato. It has been introduced into London from the Congo, and is said to be good to eat, but chiefly valuable for making ornamental salads.

Alfalfa Ranch Wanted Have a customer for a nice alfalfa ranch and home. What have you? ***White & Newby,*** 404 Hellman Bldg, Los Angeles, Cal.

Alfalfa and Fruit Land

To the Homeseeker. It will pay you to investigate our land in the Gridley Colonies, Butte, Co., California. We offer irrigated land as good as any in California at $50. to $100. per acre with a fully paid water right. Water costs only One Dollar per acre a year. We build the ditch to your land.

Anything that will grow in California can be produced on our land. Soil is a sedimentary loam. very deep and free from alkali. This is the land that grows the Big Oaks. No better land anywhere.

Alfalfa and Dairying, peaches, grapes, English Walnuts and figs pay the best Big fruit cannery, also a fruit drying plant at Gridley. New Electric Railway now building.

Good schools, churches, etc; good roads. A prosperous community, with a bright future.

Write for free printed matter.

Chas. F. O'Brien, Gen. Mgr.

30 Montgomery Street
San Francisco, Cal.

Apple Orchards

We have placed on the market five-acre apple orchards (two-year-old trees) with crop of corn planted between, at the small sum of ***$1,150,*** that will double in value in five years and trible in ten years, besides making interest on your investment during the growth of trees. The land is all right and trees are beauties, situated right in the apple center and only 3½ miles from the prosperous city of Watsonville, the largest apple growing section west of the Missouri river. Land level and oiled roads from city to the ranch. These tracts can be bought for $250.00 down and $15.00 per month, or on terms to suit you. This is a grand opportunity to own an apple orchard and chicken ranch. ***Investigate Now.*** You can have larger tracts if desired on same terms.

Farmers in Congress.—It is generally considered good policy, in business life, that "the shoemaker should stick to his last;" in other words "every man to his own calling." In organizations of every class save one, when representatives are wanted for the transaction of business, a committee is appointed, with power to act, because of their peculiar fitness for the work under consideration and their knowledge of the needs of the people whom they represent.

The one marked exception to this mode of procedure lies in political life. There is no question but that, in the great majority of cases, men are selected because of their pull with the party leaders—"the powers that be"—not by reason of being qualified for the position. In a few cases, in our own state even, the rural communities have risen in their might and demanded that a farmer represent them in the halls of legislation, both at Sacramento and Washington. We use the term "in their might" advisedly, for in some districts the farmers form the vast majority of voters, and may, if they so choose, send their humblest citizen to speak and act for their interests. They have both the might and the right.

In great centers of population, like San Francisco and Los Angeles, it is to be expected that we will send forth legislators to both State and national capitals who are intimate with city life and its needs as well as with those of the country contiguous. Such a course is expected and recognized as just. But we have many districts (State and Federal) that contain no cities of any size, in which all the towns are dependent for their very existence upon the support of the farmer. In such cases the farmer should not be slow to recognize and claim his rights. Men should be selected for positions of trust and influence who not only understand the needs of the district and are in sympathy therewith, but only those should be chosen who are financially interested in the section they wish to represent—landowners, real farmers—part of the very life-blood of the community. If farmers will but learn to select one of their own number for important political office, one who is competent and trustworthy, and give him their unqualified support regardless of party lines, then, and not till then may they expect to see legislation especially designed to meet the needs of our great and increasing agricultural interests.

* * *

Alcohol for Fuel.—The most importnat enactment of the 58th Congress in its relation to the farmer was that for the withdrawal from bond, tax free, domestic alcohol when rendered unfit for beverage or liquid medicinal uses by mixing with suitable de-naturing materials. That part of the act which sets forth the purpose of the new law are as follows:

"That from and after January 1st, 1907, domestic alcohol of such degree of proof as may be prescribed by the Commissioner of Internal Revenue, and approved by the Secretary of the Treasury, may be withdrawn from bond without the payment of internal-revenue tax, for use in the arts and industries, and for fuel, light, and power, provided said alcohol shall have been mixed in the presence and under the direction of an authorized Government officer, after withdrawal from the distillery warehouse, with methyl alcohol or other denaturing material or materials, or admixture of the same, suitable to the use for which the alcohol is withdrawn, but which destroys its character as a beverage, and renders it unfit for liquid medicinal purposes."

This bill is a very broad and liberal measure and the part the farmer is to have in its general introduction is to be seen from figures made by an expert on the yield of alcohol from various farm products which however does not include fruits, of which California can furnish no inconsiderable amount that at present is almost or entirely wasted. All culls and unmarketable fruit may now be turned into alcohol for fuel purposes, at a very slight cost as the article may be manufactured from 6 to 15 cents a galion according to the material used.

An acre of ground planted to corn will yield 140 gallons. One yielding 300 bushels of the ordinary potato will give 245 gallons, and it is said there are varieties of potatoes not suited to the table and not now grown which would give as high as 500 gallons of alcohol to the acre. The sweet potato is also a yielder of a high percentage, as is also the sugar beet. The corn stalks grown on an acre of ground and at present wasted, are said to be capable of producing 170 gallons of commercial alcohol. Almost everything grown on the farm is available for its manufacture and it is to be expected that with the removal of the tax and the wider introduction of the alcohol for light, heat and power, a distillery for its manufacture will become in time as fixed a feature of every farming community as is now the flour mill. Each community will be found to a large extent making its own alcohol for domestic use out of the waste products of the surrounding farms, the surplus of its fields.

It is expected that it will be the most desirable substitute for coal and oil fuels, while for burning in lamps it makes a better light and a quart of alcohol burns about twice as long as one of kerosene. With a cheap supply, alcohol would become a formidable competitor of gasoline in the operation of automobiles and small engines, not only as a direct power, but as a fuel for steam-propelled ones. In Germany there are said to now be 6000 such engines run by the duty-free alcohol of that country. Thousands of small engines now in use with gasoline as the explosive or steam generating fuel can be operated without mechanical alteration by the substitution of alcohol. In engineering circles it is accepted as the coming substitute for both gasoline and kerosene, and we may reasonably expect to note its use, in the near future, in solving the problem of cheaper water for irrigation purposes in California.

* * *

A Golden Opportunity.—Every true Californian is watching with interest the progress of the battle for a better, cleaner, safer, more beautiful San Francisco. The opponents of improvement are leaving no stone unturned to defeat the plans, which, if carried out, would eventually give us a metropolis to which the whole State might point with pride as being a twentieth century city in every respect.

For years and years before the Baltimore fire one of the greatest drawbacks to the old business section of that city had been its narrow streets, and with the steady increase of business the thoroughfares were so crowded that traffic was greatly hampered. Before the fire plans for the widening of some of the streets had been prepared, but there was one obstacle, and that was the great cost, since not only did the land have to be bought, but the warehouses as well.

When that section was a mass of smouldering ruins the mayor called together a committee of the leading citizens of the city and the situation was talked over. It was decided to appoint a citizens' emergency committee to consider the improvements to be made. Within a week the committee submitted its report, which has since been carried out, and which involved the widening of no less than a dozen important thoroughfares, adding to the city's street area 348,710 square feet. Many of these streets were widened from 50 to 76 feet, and one from 45 to 108 feet.

The carrying out of the suggestions for the improvement of the streets was a stupendous task, but the Burnt District Commission was indefatigable and where property owners would not accept what was considered fair valuations for their lots the matter was sifted out in the courts, and, be it said to the credit of the latter, the work was pushed through and speedy settlements were made.

Overcoming all obstacles the work of widening the streets progressed rapidly, and today the thoroughfares are completed and paved. The settling of the street widenings and the laying off of the new lines caused some delay to the rebuilding, but several men took chances, and the moment the new street grades and lines were established the work of rebuilding went on rapidly. It was less than nine months that work had advanced so far that the burnt district was no more and the more euphonious name of new district was given to it.

This name was well deserved, and, as the hundreds of fine warehouses, stores and office buildings arose from the ashes, the advantages of the widened streets were rapidly perceived, and there has been considerable regret expressed that more streets were not so improved.

San Francisco now has a golden opportunity if she will but grasp it, to so rebuild that she will be pointed to in the future as a model that budding municipalities might copy with both profit and pleasure. From a standpoint of civic beauty the old San Francisco had nothing to admire aside from Golden Gate Park, but much that called for unmeasured criticism. She now has the golden opportunity of proving to the world that the terrible disaster so recently visited upon her was somewhat of a blessing in disguise. May she prove equal to the emergency and arise from her ashes the "City Beautiful."

* * *

The Farm Boy. The boy who is brought up in the country lives, in comparison with his city cousin, a broad life, filled with rich experiences. Of the two, only he may at all times enjoy the fresh air, the green fields, the running streams, the luxurious foliage, the joyous, singing life of bird and bee and the thousand and one joys which rural scenes alone provide and which the city boy knows not.

Too often, in the case of the city boy, is a "shop" handy, where he may take all his "breakdowns and bust ups," while in the country the boy learns to "do things." No handy shop with the multiplicity of conveniences easily within reach—he is forced, luckily, to rely upon his own resources and it is the resourceful man who "does things" all through life, who is equal to every emergency.

The various phases of farm life are all educational, they make the farm boy self-reliant, independent. When confronted with trouble or danger he is equal to the occasion with a sure and certain solution to every problem. We pity the boy who has not been through the trying experiences connected with farm life for, unless he has passed through a similar schooling in other lines or is naturally self-reliant he is not prepared to stand the "crucial test" with which all are confronted who seek for success in this life.

Parents should strive their level best to make life attractive on the farm. See that your boy gets as many holidays as the city apprentice. Give him a plot of ground upon which he may grow anything he chooses. Let him have a fine calf or pig for his "very own." And above all things, while trying to steer him right, let him spend the proceeds from his sales as he sees fit. The reverse of all this will send your boy to the city at an early age.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Orosi reports unusually good fruit crops.

Redlands reports many new orange groves.

8 and 9 cents is being offered for dried apples.

The fig crop in all parts of the State is a good one.

Dinuba has purchased and is planting a ten-acre park.

This season will be a crack-a-jack for California lemons.

Orange packing in the Porterville district is about ended.

Some Orosi vineyardists are now sulphuring the second time.

Sonoma County will dry a large quantity of blackberries this season.

The Whittier Citrus Association shipped 14 carloads of Valencias last week.

Peach growers around Marysville are selling their crops for $60 per ton f. o. b.

An Azusa grower has Oregon Long blackberries which are really long—2½ inches.

From 103 young Valencia trees an Orosi farmer sold $910 worth of oranges last week.

Many orchards and berry patches around Visalia have already been killed by the floods.

Late rains, without frosts, have insured a fine yield of wine grapes in the Sonoma Valley.

The price of blackberries is very low compared with other fruits in all parts of the State.

On account of an excess of wet weather grape growers are using lots of sulphur on their vines.

This season's high prices has already caused a considerable acreage to be planted to citrus fruits.

Last week's hot spell, which seemed to be pretty general all over the State, has ripened up apricots very fast.

Los Angeles will have a flower show in November, and Santa Barbara two, one in August and one in October.

Two Toluca men sold their peach and cot orchards last week for $300 per acre, retaining the present crop.

There is a persistent rumor that will not down that something will happen to the Citrus Union in the near future.

Two orchard owners in San Bernardino County have each received $25,000 from 60 acres of oranges this season.

Christian Colony, in San Joaquin County, shipped Alexander peaches and Abundance and Climax plums ten days ago.

The hot weather has caused a shortage of fresh fruits at many points, though ripening has been hastened by the heat.

The Taylor Seed Co., of Glendale, reports many European orders for California grown seeds. One of considerable size was received on Tuesday from Paris.

The Toluca fruit growers sold their peaches for $30 per ton for free stones and $37.50 for clings. The crop is estimated at 2000 tons.

At Mountain View buyers are offering $50 to $60 per ton for green apricots and 12 cents per pound for the dried, and no fruit in sight.

Brawley has a new melon known as Burrell's Golden Gem, which it is thought will displace the Rockyford, being just as good and much superior in size.

AGRICULTURAL.

Brawley is shiping Kaffir corn.

Melon aphis has been bad on the desert.

The Sacramento region had a rain last Friday.

Placer County had still another rain on Monday.

Salinas marketed her first threshed barley on the 14th.

Brawley shipped the first car of melons on the 12th.

Lancaster reports a most unusual crop of hay and grain.

Traver is the center of a large potato district this year.

Imperial Valley melon growers are calling for more pickers.

The Sonoma County grape crop is fine, with prices "way up."

Holtville expects to market 300,000 crates of melons this season.

Potato blight has appeared at Blanco in Monterey County.

16,000 sacks of grain were received in Sanger one day last week.

The Coachella melon acreage is about double that of last year.

300 sections of farm land are covered by the return of Tulare Lake.

El Cajon is bragging about a head of cabbage which weighs 33 pounds.

Coachella shipped her first car of melons just one day earlier than last year.

Orosi farmers are using Indians in their hay fields with satisfactory results.

Mexican canteloupes were on the Eastern markets with the first from California.

A crate of watermelons from the desert sold in Los Angeles on the 10th for $28.

The Mound Farmers' Club (Ventura County) will picnic at Casitas on Saturday.

Sanger, in Fresno County, claims the honor of harvesting the first grain of the season.

Kings River and Tulare Lake are highest for years past and many crops have been destroyed.

One Perris rancher is harvesting 60,000 sacks of wheat and 20,000 sacks of barley from 12,000 acres.

Watermelons have ben ripe on the desert for several weeks but not in sufficient quantities to ship.

Cantaloupes are getting to be within reach of the ordinary pocketbook, but watermelons—"nuff sed."

The Imperial Valley's biggest crop is not melons, nor is it sold; it is alfalfa, and it is all home fed.

New potatoes are not plenty, the early crop is exhausted and the blight is catching many later patches.

"Dinis" Kearney, who says he was cousin to the late M. Theo. Kearney, would like some of that Fresno land.

The Riverside Chamber of Commerce is running excursions from that city to Coachella to view the canteloupes.

Farmers around Fairmount, in the Antelope Valley, are complaining of damage to their wheat by the grasshoppers.

The next meeting of the Corona farmers club will be held the second Tuesday in July at the home of Mr. J. F. Merchant.

Farmers around parts of Tulare Lake are offering half their crops to anyone who will haul and stack it back a mile farther from the water.

The first shipments of canteloupes to New York netted the growers about 30 cents apiece for melons just big enough to taste. Talk about "getting money from home."

On account of the beans not being able to get through the crust formed by the rains, a heavy acreage will have to be replanted in many sections. Fillmore reports a heavy loss.

An Oroville news items states that the removal of the U. S. plant gardens from Santa Ana to Chico was on account of the superior soil at the latter place. Soils had nothing to do with it; at both places the soil is all that could be asked and will raise anything, even a row, as events have proved.

LIVE STOCK.

Stock feed along the upper Tulu is best in many years.

Black bass are unusually thick at Marysville this year.

600 head of cattle were shipped from Dinuba last week.

The Kings County Poultry Show will be held December 19-22.

The Healdsburg wool sales last week brought 25 cents per pound.

The Novata cheese factory shipped 25,000 pounds one day last week.

Escondido had a lively egg market last week, prices going up to 24 cents.

Petaluma has some active professional poultry thieves just at present.

During May the Downey Creamery handled 310,572 pounds of butter and made 7,470 rolls.

Tens of thousands of sheep have been lost by floods in Montana during the past ten days.

Sawdust from the mills is so thick in the river above Oroville as to completely destroy the fish.

Unusual cold weather has resulted in the loss of many recently sheared sheep in the mountain districts.

Butter has gone up in the markets of Los Angeles and vicinity, amounting on local creamery to five cents per roll.

The price for salmon this season is 3 cents per pound for all sizes, and over 100 boats are at work around Monterey.

All sections of the state report an increased and increasing supply of eggs and we may look for lower prices immediately.

Northern eggs are pouring into the Los Angeles market and on account of the hot weather many are only fit for presentation to the vaudeville stage.

Tuesday was wool sale day at Cloverdale and there was a large attendance of buyers. Much wool was offered and the highest price paid was 25 cents per pound.

At the 21st annual meeting of the Holstein-Friesian Association of America, held at Syracuse, N. Y., June 6th, Hon. R. M. Hotaling of San Francisco was elected one of the vice-presidents.

Croakers in San Diego County and elsewhere predicted no honey because of continuous damp, cloudy weather and no blossom, but the sages have now began to blossom most profusely, and a heavy yield of honey is certain.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

SORGHUM.

Now why should sorghum be grown in California will be asked? For many people here think that alfalfa is the one standby for the dairy man. So it is, yet sorghum comes in well as a catch crop and as a means of giving a cow a change of food. It is cheap, the seed is always readily obtainable and it never fails if it has the slightest chance to grow. One disadvantage to it is that on thin lands it exhausts the fertility rapidly, but hardly more than any other crop that produces a like bulk of growth. It is not an uncommon thing to harvest three or four cuttings for soiling, or hay, from a sorghum field in a season, for it grows early and late until a severe frost takes it, or until it is plowed up

The non-saccharine sorghums are objectionable, as the Kaffir group will hardly pay on heavy land, as it is too expensive to clear the land from the heavy, stubborn roots Indeed, it takes a good four-horse team to turn them out of the ground

Sorghum stands alkali better than corn and will produce on land that will only grow sugar beets The forty acres reclaimed by the government from alkali by under-draining, ten miles from Fresno, grew sorghum among the first crops after it was washed and before it was free enough from alkali to grow wheat Old grain fields worn out from years of cropping to wheat and barley produce good sorghum crops as it roots more deeply and reaches fresh soil unimpoverished by the cereals

The soil should be plowed deeply and made fine before the sorghum is sown In California the most successful growers no longer attempt to sow sorghum broadcast, but drill it in with a corn planter in rows two or three feet apart, making it very close in the rows to ensure the stalks being slender and tender. California sorghum must be cultivated or else such weeds as mustard, sun flower, cockle bur and "ramrods" will outgrow the tender sorghum Usually an irrigation is given to the sorghum each time it is cut, this starts it to growing at once, for it loves heat and only requires a drink of water to rush up again in a hurry, usually only four weeks need elapse between the cuttings after the warm weather begins. As the seed is sown thickly it requires about forty pounds to the acre when drilled in. This makes it thick enough to have the stems slender and tender, making it quite different from the coarse heavy stalks often grown for fodder, these latter the stock throw around and waste as they do not care for them.

The seed can be sown from April to July, the longer the crop is on the ground the more frequently it can be cut. The principal use for sorghum is for soiling. It is cut each day with a mower set high enough to miss the first joint, and loaded onto a wagon and let stand in the field until the next day, when it is hauled to the cows. The load thrown off, the wagon returns to the field, the horses are put on the mower and the sorghum is then loaded and left until the following day before feeding. As a further precaution against bloating, the sorghum is widely spread over the field so that a cow must walk along for a distance to secure a full meal, and cannot fill up standing in one place. The cutting for soiling begins when the sorghum has made three joints, when two only are cut and the lower one being left; if it is cut below this point it is very slow in starting into new growth. If it is not cut until it heads it has a greater feeding value when headed; still the loss in amount of herbage produced and in the slower starting again into new growth will more than offset the advantages gained of increased carbohydrates. The young leaves have more protein than the matured plant, to further offset the seeding loss. Cows are like ourselves in craving a juicy green food in the summer time and will give better results on this form of food than on grains of which the actual chemical analysis shows a greater food value, the reason being that they eat more freely of it and have an increased assimilation.

Sorghum makes good hay and is easily cured if raked after it has lain in the windrows twenty-four hours, and put into small cocks, these are opened up if the hay heats and the curing goes on slowly; after a week or ten days it is cured without becoming dried up with the heat, for so much hay sold is really only woody fiber with all nutriment burnt out of it by the sun bleaching it has received.

The making of sorghum hay saves labor for it is heavy to handle while green—about, say five to one. I can only give this as an opinion as I have only made sorghum hay a few times when I had a little more than needed for soiling purposes. The hay can be used for thatching, when I had more cattle than I had shelter for during the rainy days and nights, a rough shelter of poplar poles was run up and the sorghum hay stacked at one side and on the ends and also a light covering over top of the hay, made them very comfortable on windy nights. They soon found it good and promptly ate themselves out of house and home. Sorghum far outyields common corn when used for soiling, for it can be cut two or three times and yet have time enough to make a crop of seed. In the silo it is apt to be too sour, this can be obviated by letting it go until the seeds harden a little and then cutting it into the silo with green alfalfa. While I have not an analysis of the food value, we have found it an excellent feed when made one-third alfalfa. As mixed the cows are crazy for it, they relished this mixture more than either straight alfalfa or straight sorghum silage.

The cured hay from a good sorghum field sown in drill rows will average about six tons to the acre, this is less than if sown broadcast. Now how much soiling has it furnished to us? Here on the Minnewawa where the land is heavy and the water abundant an acre of well set sorghum will furnish twenty cows for twenty days all they can consume of green food. One year fifteen acres carried two hundred and fifty cows from June 28th to August 20th, giving them all the green food they would eat, and often leaving some pickings for the colts. The sorghum of this field then matured and furnished some material for the silo filling in October The entire fifteen acres was cut over twice for soiling. The land had been heavily manured the fall before and laid without a crop until spring, when it was put into order and the sorghum sown on it. The seed was drilled in in rows and the work of seeding was completed on April 14th. The manuring pays well, though a crop can be grown without it.

COW'S FALSE TEETH.

Editor Cultivator:—I recently purchased an old cow. I now find that she has lost all but three of her incisors, two on the right side and one on the left, the cavities where the other teeth were do not show. Could false teeth be obtained for her and secured in her mouth? Or would it be better to pull these remaining teeth? She cannot eat very well. Please reply through the Cultivator.—H. M. McK.

We viewed this question of the "calf" as ways and means of helping the old "cow" as of sufficient moment to call others in council and here by present their several suggestive remarks as full of cheer.

1. "This is certainly a serious case and I am glad to see you are so full of loving kindness to this dear sister. The use of mono-oxide gas would be humane if it is decided to remove the remaining teeth. There is a better course, however, for owing to the facial disfigurement of sunken cheeks, I should certainly advise bridge work in gold. This would only cost $3000 to $4000 and would preserve the beauty of the jaw lines that Madame will still be able to grace society. This cow will be a new development of the dual purpose idea——more valuable when dead as a gold mine than when alive as a butter producer."—Mrs. M. E. S.

2. "In reply to your first question regarding your obtaining false teeth for your old cow, I beg to state that this is entirely possible, but you will have to have them made to order. Any first-class dentist in Paris or London can make them so that you can not tell the difference between those incisors now remaining in the cow's mouth and the false ones. After you receive these teeth put the cow under the influence of chloroform, pry open her mouth, and insert the false teeth in the old cavities. If you cannot find the old cavities make new ones with a hatchet and then get a small boy, or your wife, to hold the teeth in place, always why the cow's jaws are in motion. If the cow objects kill her."—B. L. (Manager.)

3. "Take her to Bartlett Springs. They say if you soak a cow's hide in the water there the cow comes to fill it; it certainly should make teeth to grow. Failing in this rig up a silage cutter in her mouth and gear it to her tail, so when ever she switches the tail the cutter chops the feed."—S. A. (Foreman.)

4. "Get a rubber tube long enough to tie to her mouth and insert a milking tube into a teat and start her up prepared to feed herself."—Mrs. C. (Housekeeper.)

5. "Here is a case to practice Oslerism on."—M. E. C.

6. Last of all comes the "wise man" with this remarkable piece of scientific writing: "Carefully pry open the mouth with a cold chisel and examine the alveolar processes and exclude the existence of pyorrhoea alveolaris. This should be done under cocaine anaesthesia, and menthol spray. See that the structural dentine of each tooth is intact and that the laminated structure and the pulp is sound. The missing teeth are probably worn away by eating grass on sandy land. When stumps of these missing teeth are found, bore into each one, and in the hole anchor a pivot tooth, which will make the cow as good as new. When the job is

TUBULAR
CREAM SEPARATORS

21 POUNDS MORE
BUTTER PER WEEK

Barnesville, Ohio, June 20, 1905: We were milking ten cows May 19. That day we took a Tubular separator for trial. **We used it one week and got 86 pounds of butter that week. The week before** we used it, we got only 65 pounds. **The week after** the agent took it away we got only 64 pounds. We felt we ought to have it. Later we arranged to buy it. We recommend the Tubular to anyone interested in cows. It surely will pay any one to buy a Tubular.

completed feed on soft food for three weeks, such as asparagus tips and alfalfa blossoms, and cleanse the teeth night and morning just before milking time with a clean new steel file."

STILL USE CHURNS.

"The chances are ten to one or better," said a woodenware man, "that the butter you buy at the grocery store now was made in a creamery, for the great bulk of the butter consumed in this country is now made in milk establishments. But there is still some butter made by hand and we still sell churns right along.

"The greater number of these now sold are of the cylinder type, operated by a crank, turning within the churn a wheel with paddles, sometimes like the paddle wheel of a steamboat; but we still sell, as well, churns of the old-fashioned dasher type, such as their grandfathers used before them. I might add that the old-fashioned dasher churn is still, as it has always been, painted blue.

"Who still buys these old-style hand churns in the day of machine made butter? Why, so to speak, the oldest people, and the most modern.

"They are bought by small farmers keeping only one or a few cows, who naturally continue to make their own butter, and who make it, of course, with a hand churn. Some of these farmers might make even more butter than they would require for their own use, and the surplus they would sell, as they would their surplus eggs, to the country store.

"And you would find larger farmers, too, farmers perhaps keeping many cows and selling the bulk of their milk to a creamery, still continuing to make the butter that they needed for themselves, and making it, as they have always done, in a hand churn.

"And such churns are sold to people living in suburban or country homes and keeping cows, who make their own butter because they prefer to, anyway, and they are bought by various people, everywhere, who want sweet, or unsalted, butter, and who make it for themselves in hand churns.

"We export churns to the West Indies and South America and to New Zealand and Australia, and to dairying countries in various other parts of the world."—Washington Post.

CREAMERY CAUSES PERMANENT PROSPERITY.

Years ago when the railroads shops were removed from Tulare, there was a general feeling of gloom in the community, and many there were who declared, and who confidently believed, that Tulare would never recover from the blow. And for a time the Southern Pacific's payroll did exert hurtful influence on the business interests of the town. It was a good thing, that payroll, and we all grieved to see it go, but the writer was wondering this morning how many of our people would be willing to give up the two creameries now here if by so doing we might have the shops back again. As stated in a recent issue of the Register, $17,488 represents the aggregate of the payments made during last month to the farmers who make Tulare their trading point. That is a payroll worth having isn't it? And the cheering promise is that these figures will grow from month to month, while, better still, the permanency of this money-distributing business is assured. Nobody can take it away from us.—Tulare Register.

JERSEYS AT ST. LOUIS.

The managers of the Louisiana Purchase Exposition, held at St Louis, Mo., in 1904, inaugurated an exhibition of dairy cattle in the form of a "dairy cow demonstration," open to cows of all breeds. Representatives of the various breeds and of the Exposition met and drew up a set of rules governing the demonstration, and Prof. E. H. Farrington of the Wisconsin Agricultural Experiment Station was selected by the Exposition management to superintend the test and carry out the details.

Animals representative of the Jersey, Holstein-Friesian, Brown Swiss and Shorthorn breeds were entered in the demonstration—twenty-five Jerseys, fifteen Holsteins, five Brown Swiss and twenty-five Shorthorns, one of which latter died during the test. The period of the demonstration was 120 days, from June 16 to October 13, inclusive.

Each cow was weighed on five consecutive days at the beginning of the test and also on five days at the end, weighings were taken as the weights of the cows at the start and the close of the tests respectively.

The cows of each herd were fed and cared for by superintendents representing the association of the breed to which they belonged, and these superintendents, or their assistants, indicated each day the amounts and kinds of feed to be given each cow.

Clerks appointed by the Exposition management weighed out the quantities of the various feeds supplied each cow daily, as requisitioned by the superintendents, also weighed the milk and took samples of same, keeping accurate records of feed and production.

The values of the feed stuffs were fixed by the official committee of the Exposition, and these values were used in computing profits made in the test. The cows were fed and milked three times a day. Each milking was weighed and sampled, and a composite sample of the three milkings was tested. Each sample of milk was tested independently by two chemists. Butter was valued at 25 cents per pound, solids not fat at 3 cents per pound, and butter fat at 30 cents per pound.

The cream was not churned. The amount of butter being credited each cow was computed from the percentage of fat in her milk and by the use of "overruns" based as follows: The skimmed milk is 85 per cent of the whole milk; the skimmed milk tests one-tenth of one per cent fat; the buttermilk is ten per cent of the whole milk; the buttermilk tests two-tenths of one per cent fat; the butter contains 83 per cent fat.

The cows in the demonstration were entered in three classes, as follows:

Class A included herds and individual cows entered for demonstrating the economic production of milk for all purposes of dairying, each cow being credited with the total pounds of fat and of solids not fat in her milk at the prices quoted above.

Class C included herds and individual cows entered for demonstrating the economic production of milk and beef. The Jerseys were not entered in this class, and the Shorthorns were not entered in Class A.

All weighing of feed and milk, taking and testing of samples, checking and recording results, etc., were conscientiously and carefully made by experts employed by the Exposition management, under the personal direction of Prof. Farrington, so that he was afterwards able to write: "There is no fiction in these World's Fair records."

The awards show that the Jerseys won all the honors competed for the demonstration, with two exceptions: a Holstein cow attained to the fifth place in Class A and second place in Class B. As a herd the Jerseys led all the others.

Prof. H. S. Redfield of Columbia University, New York, writing on the St. Louis dairy demonstration, presents the following as important feature:

First.—It is to be remembered that the different breeds were represented by animals selected, not by opponents of the breed, nor outsiders, but by its advocates, men who knew its qualities, and who knew also the conditions of the test. We have, therefore, a perfect right to assume that the animals chosen were those believed to be the best calculated to demonstrate the merits of the breed; and no argument to invalidate the results of the demonstration is entitled to the slightest consideration which is based upon the proposition that a proper selection of animals was not made.

"Second.—Each herd was in charge of a man who was not only a believer in the particular breed of which the herd was composed, but was also

a man of experience in feeding and handling animals of this breed to secure the best results. The kind and amount of food were entirely under his control, as were also the care and management of the herd, so that no valid claim can be made that any breed has failed because of lack of skill in feeding and handling.

"Third.—Although, as stated, the one in charge of a herd was allowed to feed such amount as he deemed best, and to make up the ration from different feeding stuffs according to his own judgment, a valuation of the different articles which might be used in a ration was fixed by the officials of the Exposition, who also kept a complete record of the kind and amount of food consumed, so that the final estimate of the cost of the products is made by independent officials, not connected with any breed, upon a fixed valuation of different feeds, applicable alike to all the breeds. It will, therefore, be entitled to be relied upon as correct, and as absolutely fair and impartial.

"Fourth.—As a record was kept by independent officials of all food consumed, so a record was kept of all products, including gain in weight; as the cost of the food will be estimated according to a fixed schedule of prices, so the value of all the products will be estimated in accordance with a similar schedule which is used for all the breeds. As the estimate of the cost of food will be entitled to full credence as correct, fair and impartial so will the estimate of value of products be absolutely reliable, and also the final and most important estimate of net profit.

"Since, then, in this demonstration, we have animals selected and cared for by partisans, but under an independent supervision, which gives us an accurate and impartial estimate of cost of food, value of products, and net profits, we have a perfect right to consider the results conclusive, as between the breeds, concerning all points which were fully covered by the test.

"The test will give important and conclusive evidence upon one point which is constantly overlooked, but which has a great influence on this controlling factor in the choice. I refer to the influence of the size of a dairy animal on economy of production. All who have given the matter study agree that the amount of food required for the purpose of sustaining life and repairing waste—for what is known as a maintenance ration—is in proportion to the size of the animal. That is, an animal weighing twelve hundred pounds requires much more food for this purpose than one weighing nine hundred pounds, and this food must be given before any return can be looked for in milk-pail or butter-tub. This difference in cost of a maintenance ration, when extended over the entire milking period of a dairy animal, is a large and important item.

A GRAND RECORD.

Editor Cultivator:—I inclose detailed statement of yearly fat estimates recently completed by two of our cows. These cows are both now entered in Class A of Registry of Merit, their records being much larger than necessary to make them eligible for Advanced Registry. Please emphasize the fact that these figures represent butter fat and that the estimated quantity of butter for the year can be figured by dividing the fat by .85, which will show for Rhyme a yield of about 534 pounds of butter and for Pedro's Landseer Beauty about 508 pounds. We consider the record of this latter cow especially good as it was made with her second calf. She will not be five years old till the 8th of December, 1906, and is giving this year a very material increase in milk over last, so that her yield will probably run up to 550 pounds of butter.

This makes five cows in our herd which have entered the Register of Merit, the lowest record being 411 pounds of butter fat in one year and the highest 497 pounds. There may be better cows together in a small herd, but it is up to their owner to prove it as we have done, at no little expense.

Our young heifers by Sargeant Fox are out of such cows and if they do not turn out extra well they will belie both their pedigree and their looks.

Very truly yours,

C. W. LEFFINGWELL, Jr.

(Mr. Leffingwell encloses certificate of the official test from the head office of the American Jersey Cattle Club in New York. The table is somewhat technial, in one column running into 10 decimals, making it impossible to reproduce in our types or we would gladly publish it, for no one on the Pacific Coast has done so much in the upbuilding of a high-class herd of registered Jerseys as has Mr. Leffingwell. We rejoice with him over this really brilliant record.—Ed.)

MISTAKES IN FEEDING.

Farmers are likely to make one of two mistakes in feeding their dairy cows: First in not giving them enough; and, second in not giving them a properly balanced ration· Farmers do not realize that a cow is simply a machine for the conversion of grain and forage into milk and butter, and that it requires about 60 per cent. of what she can eat to run the machine. If the farmer, therefore, feeds only 60 per cent. of her capacity, he is simply converting the cow into a manure factory instead of a butter factory. A butter factory should be run to its fullest capacity if possible.

Again, farmers do not always remember that the raw material for the factory must be of a character to produce the product required. The casein, which is the largest solid item in the milk, is an albuminous product, and therefore the cow should have a flesh forming feed, what we call a narrow ration as distinguished from "wide" or carbohydrate ration fitted for fattening animals. Much of the success of the dairyman depends on the proper balance of the ration.

Neither do farmers always remember that the balance of the ration as well as the amount of milk given is determined by the the quality of the milk she gives· There is no need of feeding a cow more than she can digest and assimilate. If she, however, gives a large amount of rich milk, she requires a somewhat different balance from the cow that gives a medium quantity of "blue" milk.

If your horse has sore shoulders, there is something wrong with his collar.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

A TALK ON PLYMOUTH ROCKS.

"Which is the best breed of fowls?" is a question frequently propounded to me.

"The breed that you like the best," is my reply. "Any one, man or woman will succeed best with the breed he likes best. Fortunately there is a great variety of fowls, so one's choice can be almost unlimited."

"But I really have no choice and come to you for information and advice. Is there no favorite breed?"

"There is a favorite breed all over this country from Maine to California. It is the Plymouth Rocks."

"America for Americans" might be reversed in poultrydom and should in the opinion of the writer read "American breeds for the American people.' ' There are at present in the American Standard of Perfection three breeds, the Plymouth Rocks, the Wyandottes and the Rhode Island Reds. There are three breeds of Plymouth Rocks in the Standard, the Barred, the White and the Buff.

The American classes of fowls have been made by American breeders crossing and re-crossing different and usually foreign breeds for a purpose, generally for utility to increase the egg yield or for beauty of plumage or a larger and better development of breast meat. Yankee sagacity evolved these breeds and the first of them is the "Plymouth Rocks."

"Plymouth Rocks" was the very name given to this breed about 37 years ago. It is the result of several matings or crossings made some 40 years ago. I need not go back to discuss each mating which was deemed advisable, we have the product and are thankful for it. The interest in Plymouth Rocks is almost world wide, no other breed has awakened so much enthusiasm; to perfect it and beautify it more profound study has been given than has ever been devoted to any other breed and there is no variety the product of American skill and breeding, that one can put on the market of the world with so much pride, and none other is received from our shores by foreign fanciers with so much favor. Plymouth Rocks need no booming. They are what is called a "general fowl" bird. They thrive any where, are rapid growers, making, plump, juicy broilers at eight weeks and from that age up are always, if properly fed, ready for killing. They are a favorite with farmers and market poultry men, who breed this variety more extensively than all other breds combined. Utility and actual worth are the basis of this popularity, and make the Plymouth Rock a breed that will always stay with us.

The color of the plumage of the Barred Plymouth Rock is body color bluish grey, barred with narrow, paralelled lines of a dark blue that stops

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A Filcher, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

WRITE FOR CATALOGUE 47—A BEAUTY

San Francisco Office and Salesroom, 33 Market St.

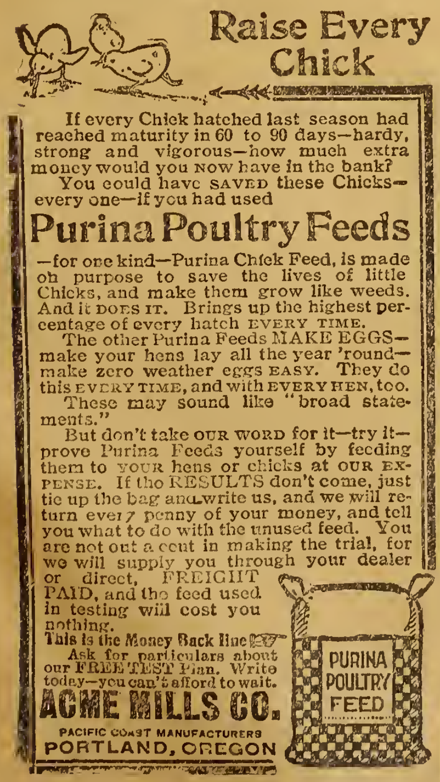
short of a positive black. By some the color is called black and white and by others blue. The coloring and marking as well as the shape of this attractive fowl have led to much discussion and earnest study on the part of fanciers, but all agree that the barring of the dark and light lines on the feathers shall run in straight, distinct lines throughout the entire length of the feather. The barring is somewhat smaller on the hackle and saddle feathers than on the other portions of the body. In beak, shank and toes deep yellow is the color coveted by the fanciers. In all varieties the comb is single with five serrations, is small or medium in size, wattles well rounded, earlobes red.

The typical Plymouth Rock is a compactly built, strong, but not a coarse boned fowl. Standard weights are for cocks, 9 1-2 pounds; cockerel, 8 pounds; hen, 7 1-2 pounds; and for pullet, 6 1-2 pounds. They are good layers the year round, and in winter they lay exceptionally well. The eggs are brown and average eight to the pound. They are good sitters and excellent mothers. Plymouth Rocks have been bred by the writer for 30 years with satisfaction and success.

The White Plymouth Rock is said to be a descendent of sports of the Barred. It is of the same form and weight, but pure white in plumage. It possessses all the excellencies of its popular ancestors. The difference in Standard requirements is on the color of plumage only. The white variety have the same yellow skin, beak and legs; the same bay eye and blocky build.

As a market fowl no one will question their superiority. A white fowl is an ideal market bird, especially when covered with bright yellow skin like the White Rocks, and when to these qualities is added an entire absence of colored pin feathers at all stages of growth, the excellency of this variety is further proved. There is no other variety or breed that makes better, quicker growth than the White Plymouth Rocks or that will stand harder or more concentrated feeding. They are good as squab or chicken broilers, good as roosters, good as capons, good as fowl. Through the whole range, from the earliest broiler age to that final fricassee, which generally comes with old age, they excel.

As egg producers I have never seen the equal of the White Plymouth Rocks. They lay at an early age and keep it up persistently, doubtless with this as with other varieties, much depends upon the family or strain and whether they have been bred to the laying habit. When I was in the business I shipped White Plymouth Rocks to all parts of this country and even as far as New Zealand and the Philippines, and in every case they were reported very satisfactory as layers. In the "National Stockman and Farmers'" egg contest, competing with 143 pens of Standard and crossbred poultry, the White Plymouth Rocks won first and third prizes with the remarkable average of 287 eggs to the bird in twelve months. This is, I believe, the banner record of any breed.



Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you now have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line

Ask for particulars about our FREE TEST Plan. Write today—you can't afford to wait.

ACME MILLS CO.
PACIFIC COAST MANUFACTURERS
PORTLAND, OREGON

At a farmers' institute of the University extension course I met a man who told me he has a pen of White Plymouth Rocks that with out forcing gave him 196 2-3 eggs last year. One of these hens in 110 days layed 105 eggs. In response to a question from the director he said that he is only a beginner, has been two years here, with the exception of a few White Plymouth Rocks has only common hens, has kept an accurate account of receipts and expenditures during the past year and finds that his hens netted him $1.25 per hen. This is doing well for a beginner's first year. He has had some hard experiences, but has succeeded in making a little money and gaining health. His hens laid 50,000 eggs last year and will do better next year.

A word to those who may contemplate buying and hatching eggs of this variety. Do not be disappointed if the little chicks hatch out a smoky grey, the greyest will develop into the whitest when they feather out. It shows their pure ancestry from the grey of the Barred Rock.

The Buff Plymouth Rocks are a beautiful bird. They have the same shape, weight and general characteristics as the other varieties of Rock. the color being the only difference. They should be a clear buff through out. I have found them to have the same pleasant, quiet disposition as the White Rocks, making them an ideal fowl for a city lot, but they did not lay as well for me as the other two varieties and the California sun was hard on their plumage, fading it out. Otherwise they are very satisfactory and the correct breeding of them is an interesting study.

* * *

Roupy Turkeys (Mrs., W. H., Hanford): Please let me know through the columns of your paper, what will cure turkeys of a swollen head. The old turkey hens have had it and now my little ones are taking it and I fear it will prove fatal to them. The head and neck are swollen and the eyes are at times swollen shut and seem to secrete a foamy watery fluid. Their nostrils seem to close and they breathe through the mouth. I wish to thank you in advance for some information regarding a cure for the dreadful disease.

Answer.—Your turkeys have the roup, it is very hard to cure them. The parent turkeys having it, the young inherit it from them. I think the best thing for you to do will be to grease the heads with carbolated vaseline one day, and the next with kerosene, alternate days. Then alternate days or nights give one pill of quinine, and one pill of assafetida. Give nourishing diet such as bread and milk with a little red pepper and an onion chopped fine every day. Also try to put them on new fresh ground where there will be no microbes of disease.

* * *

Sick Turkeys (Subscriber)—As I am a subscriber to your paper I beg to ask your advice as to the treatment of a disease which has affected my flock of young turkeys.

The symptoms are as follows: The poults become suddenly mopy; a mucous like substance exudes from eyes and throats of many, but not all. Are very poor and seem to be sunken about the eyes; but those that are not affected will be thrifty and healthy looking to the day they are attacked by the disease, about 30% will show signs of bowel trouble; mortality is greater during night than day. Post mortem examination shows liver to be normal in size although a greenish fluid is found on parts of it. The disease seems contagious among the poults ranging from age of one to six weeks but the older ones seem immune to the trouble.

They are kept free from lice by dipping mothers in napthal kali. There is neither any mites for coops are sprayed. The food is cracked wheat, cracked corn, boiled egg and occasionally curd.

Will you please give me your opinion concerning this affection in the next issue of your paper and oblige.

Answer.—Your turkeys are suffering from catarrh. They are taking cold either from damp ground, or draughty sleeping place, or they may be getting the air tubes irritated by the fumes of the napthal kali and these poisonous fumes are irritating the whole intestinal canal. I think this is probably the cause of it. Only dust with buhach, don't use napthal for turkeys.

Another thing, leave out the cracked corn and give them onion finely chopped and lettuce chopped every day in their feed, even if they are on free range. For those that are sick give milk to drink and feed bread and milk. See my reply to Mrs. W. H.

* * *

Mash Food (J. R. H., Arroyo Grande)—Editor Cultivator: Enclosed fine $1 in stamps for the renewal of my subscription for your paper to June, '07. I am very much satisfied with the Cultivator and think it the best paper of its kind on the coast.

Kindly answer me the following question in your paper. I am a young poultry man and raise between 400 and 500 hens a year in my yards in the last years. Now I want to increase my stock to about 1000 or 1200 laying hens. But there is one trouble for me in this. I fed my hens cooked potatoes, middlings and bran for their mash food with very good success, my little wife peeling the potatoes every day. That made lots of work but could be done by us for a smaller lot of hens. But I am afraid we cannot do it for 1000 hens or more. So I think I have to change our soft food and want to ask you whether you could give me the mixture of a good mash food. I feed for eggs only. In the morning I give my hens boiled barley, soft food at noon and grain in the night. Besides they get lots of green stuff, ground bones, boiled blood, grit and oyster shells.

Answer.—For a long time I fed potatoes in the mash to my hens, but I never peeled them. I washed them in a tub, and when they were clean I boiled them, and then mashed them skins and all. Sometimes the hens would leave some of the skins, but generally ate them all up. I had read that the skins of the potatoes contained nitrogenous matter and that human beings ought to eat them, so I thought they would be good for hens.

You might sometimes add some carrots or turnips to the mash.

If you have succeeded well with the mixture you have given them, keep to it. I would not advise any change only don't peel the potatoes.

Have the roosts in the back part of the poultry house where no drafts of cold air can blow over the fowls at night and give them colds. But be sure to keep windows and doors open as long as possible so the flock has fresh air to breathe at night as well as day time. Screens of inch mesh wire nettings should be used over window and door openings to protect the flock from noctural varmints.

Sloppy feed may be fed all right for hogs, but not for poultry.

POULTRY RESOLUTIONS.

Education.—I will read the best poultry literature, and try to learn from those who are successful in the methods they practice; and will try to inspire myself with love for and enthusiasm in this vocation.

Breeding.—I will keep pure-bred stock of one of the laying breeds which best suits my taste. I will note which of my hens are the best layers, keeping a yearly record of the eggs they produce; and on their several records will mate these layers with cockerels from flocks with which the same care has been taken, and by this process get my eggs for hatching.

Environment.—As I want biddy to lay eggs in the winter, when the price is high, I will make her environment as near like summer as possible. I will build her house with double walls, having inner linings of paper, with a dead-air space between. I will have the windows made to let in as much sunlight as possible. I will place the dust box where she can take her bath in the sunshine, the nest boxes in a darkened place, and the perches low down, having underneath a box or boxes with legs. Biddy will do her best work when she has plenty of room and not too much company—not over 15 in the house, and at least 5 feet square for each.

Cleanliness.—I will keep the houses clean, the walls nicely whitewashed, and will protect the hens from lice and other insect parasites by the frequent use of insecticides and disinfectants. I will use plaster freely in the house, and daily in the boxes under the perches, and will remove the droppings often, and to some place where I may keep them in good condition to use as a fertilizer for my soil.

Food.—I will study to learn what the egg contains, and will supply the hen with all its elements. I will observe the kind of food she seeks for and eats when she forages in summer. She looks for grass, insects, worms, etc., with which to supplement her grain ration, and for grit with which to grind it; hence I will try to furnish all these things in the winter. During the cold weather, when she must stay in her house all day, I will plan to have her work for her breakfast, which consists of small grains thrown on the floor and deeply covered with litter, so that she may have a good appetite for her dinner, which is a warm mash made of different kinds of grains, bone meal, boiled vegetables and cut clover, so as to contain in the right proportions all the elements of the eggs; and I will feed her only what she will eat at the time. At night, in cold weather, I will feed her a little corn in the litter or other whole grain. I will supply her with green cut bone, meat, shells and grit, some kind of green food, pure drinking water, and skim-milk when I can obtain it. If she is confined in the yard in summer, I will feed her less grain, and will make a part of her food green cut clover, or, better, alfa fa, frequently plowing or spading the yard, so that she may scratch for insects. I will plant fruit trees in this yard for shade and food. When biddy is so well fed and cared for that she is happy and sings, she is then the "profitable hen."

Marketing.—If I produce the eggs for market, I will put myself in the place of the consumer, and sell him only the kind of eggs that I would wish to buy—eggs of good size, and will try to so maintain the standard of quality that there will be a demand for them at prices above market quotations.

Profit.—I will keep such account of the expenses and receipts that I will know my margin of profit. I will then know whether I am making a good profit; and if not, will look for the cause of my failure.—Country Gentleman.

GUINEAS ON THE FARM.

Guineas are perhaps the most profitable of all varieties of farm poultry; that is, when taken into consideration the small attention they require.

They begin laying in early spring, long before freezing is over, and, except when sitting and going with their young, they lay every day until the cold weather comes again in the fall.

The flesh even of an old guinea is tender and delicious when properly cooked, resembling wild game, while there is nothing finer than a young guinea broiled or fried after the manner of the old Virginia receipt. When dressed, they are round, plump, and shapely, with small bones and large breast, thus affording a large proportion of the choicest meat. Their eggs, though somewhat smaller than hens', are rich and good flavored, especially for making cake.

When the number of males and females in the flock are equal, they will mate in pairs; but should the number of hens be greater, several hens will go with the same cock, and all the hens have the same nest. This is to be preferred, as the nests are more easily found, for guineas are very cunning about concealing their nests, hiding them in retired spots among tall grass and bushes, or under wide dock leaves. After laying, the hen raises her voice in a shrill chatter which betrays the locality of her nest, though, as a rule, whenever you see guineas frequenting a certain spot between the hours of 10 a. m. and 2 p. m., there you may confidently expect to find a nest.

It is an old superstition that guinea eggs must be taken from the nest with a silver spoon, else the nest will be abandoned. I do not insist upon the silver spoon, but I do know that it is safer not to put your hands in the nest if you want them to keep on laying. Half a dozen eggs or more should be left as nest eggs.

Four weeks are required for incubation, and, unlike other chicks, the little guineas break the shell nearly every one at the same time. They are all hungry, too, and before the down is dry begin pecking at each other's eyes and feet, or trying to swallow tiny bits of egg shell. They are sprightly little things, and about the prettiest of all young fowls, but until well feathered are very tender and delicate. For this reason it is best not to allow the hens to sit in June or July, so that the little ones may be reared in warm, dry weather.—"Farmer's Daughter," in Country Gentleman.

A COUPLE OF POULTRY YARD CONVENIENCES.

At a meeting of the Southern California Poultry Breeders Society in Los Angeles last week, Mr. W. W. Bliss, of Duarte, exhibited the working of a couple of conveniences for poultrymen which caused considerable favorable comment and led many to express themselves as desirous of using them in their yards. Mr. Bliss has no patent on these appliances and offers them for the "good of the order."

The first he illustrated was a feeding arrangement made from a five gallon oil can and is used for feeding grit, cracked bone, charcoal, shell or other such feeds which it is desired to keep before the hens at all times. As the cost of the appliance is only a nickel, for which Mr. Bliss says the cans can be bought in most places, it is certainly within the reach of all poultrymen. The manner of making it is to cut out three sides of a square or oblong opening with the ordinary straight cutting can opener. This opening is about three-fourths or perhaps half of the size of the full side of the can. As the three sides of the opening are cut, the "flap" which has been cut out is caught with the fingers

EGG FOOD A.C.W. IT FILLS THE BILL
FINE FEATHERS MAKE FINE BIRDS

Is true, and especially so when the birds are fed on A. C. W. Egg Food. Take notice of your fowls after feeding A. C. W. and see if this statement is not correct. You will find the plumage shines, feathers lie close together, no rough or bedraggled appearauce. This shows the birds are **healthy.** A horse with a slick "hide" is healthy; the same way with a fowl. Yours truly.

Agricultural Chemical Works
Office and Factory: 901-907 Macy Street, Los Angeles, Cal.
Manufacturers of A. C. W. Poultry Food, A. C. W. Chick Food, Etc.

and bent outward, nearly at right angles. Then when the can is partially filled with charcoal or grit, or, with both if a partition is placed in the can, it is turned with this cut opening to one side so that the chickens may walk up and eat, the flap which has been raised is uppermost, forming a roof to protect the contents of the can from the rain.

The other appliance was an egg tester, and while much larger than the ordinary small lamp tester and somewhat more complicated in the making, yet is so much more effective and gives so much stronger light that a few words regarding it may be of value. To make this, get the ordinary size wooden shoe box standing on end and making a hinged door of the lid which swings horizontally. The common Rochester lamp is used for the lighting behind which, or rather slightly to one side of the center are placed two glass reflectors centering the light on a mirror fitted in one side of the box, opposite the hinged door. The mirror is set at an angle of possibly forty-five degrees and reflects the light to an egg shaped opening in the projection of the box above. When the egg is placed in this opening this light is so strong that daylight work may be done in testing its eggs from incubator or hen.

POULTRY POINTERS.

Don't cross two pure varieties, but cross two strains of the same variety if you want vigorous stock and you will then have pure-bred fowls, as well as vigorous, healthy stock. Pure-bred stock is without doubt the most profitable to keep and health and vigor can be just as easily obtained by crossing two specimens of the same variety that are not related to each other as by crossing two distinct varieties and by keeping only one variety the flock is more uniform and more easily handled.

Beware of overcrowding the poultry houses. If sufficient room is not available for the flock on hand, sell off part of the flock or else build more houses for them. Most flocks would be greatly benefitted by culling out the old hens and late hatched pullets anyway, and as lumber is so extremely high, it will pay most farmers best to cull their flocks down to what they have comfortable house room for Four square feet of floor space for each fowl is the lowest estimate if one expects any return from the hens during the winter, and five or six square feet is better.

Don't expect eggs in large numbers if the water supply is short, for eggs are largely composed of water.

A broiler is a chicken which weighs two pounds or under, and a spring chicken weighs from 2 to 4 pounds.

Another thing to remember in selecting eggs for hatching is that sick or over-fat hens do not lay very fertile eggs.

Leg weakness, soft eggs, egg-bound and poor hatches can nearly always be attributed to overfeeding and an extra fat condition of the hens.

Some poultrymen claim that the very strongest hatching eggs come from hens that had a judicious amount of green bone in their bill of fare.

Mites in the chicken house occasionally are no disgrace, but it is a disgrace to leave them there after they are discovered, when they can be gotten rid of at such little cost.

The raising of guinea fowls is being advocated by the agricultural department and dealers in market poultry. The demand for them is said to be good already, and increasing as rapidly as epicures become acquainted with the delights of the dish.

A HEN'S PLAINT.

A poor, scrawny hen, with drooping head and sadness in her eyes, stood on an old sugar barrel in the poultry yard and soliloquized as follows: "Times are not what they used to be in California. My ancestors told me that in the forties a good looking hen like me would sell readily for from six to ten dollars; today I, even in my younger days when fat and saucy, would not have brought more than thirty cents. Only a few years ago, my great grandmother laid eggs that sold for $1 apiece. She was fed on wheat that cost sixty centy a pound, bread crumbs made from flour sold at $100 for a fifty pound sack. Every cackle indulged in by my great grandma was worth one dollar. Today, I am fed on wheat worth less than a dollar per sack. I have to cackle a whole month for twenty cents, and my eggs sell at three dozen for a quarter, and if I fail to lay them even at that price, my meatless carcass is sold for twenty or thirty cents to the tamale woman, who stews me in pepper and sells me in a mummified form at three tamales for a quarter. Verily and a hen's life is not worth living.—Owl.

WORTH TRYING.

In running an incubator we have found it a great saving on oil to keep a thick pad or carpet on floor of machine and also on top of machine. I use several thicknesses of old soft blanket on top of my machine and find that I can run with much less oil than when I do not use the cover. If your machine is one having a regulating device on the cover, of course this cannot well be practiced without interfering with the regulator. My machine has not. Also you will need to cut a hole in the carpet you use inside on floor if your machine is ventilated from the bottom as mine is. If you want to test the matter to see how much heat is kept in by a heavy covering on top of machine just lay a sofa pillow on top of machine a few hours then slip your hand under the pillow and see for yourself how much heat comes up from top of machines that could as well be saved.—Ex.

WHOSE FAULT IS IT?

The farmer who says hens are a nusiance usually speaks the truth as far as his individual experience has gone. His plan, or rather his lack of planning for them,renders them a veritable nuisance. Any other farm stock neglected in the same way poultry has been on the average farm would also cease to render a profit to their owner. The farmer or poultryman must provide the favorable conditions and the flocks will see to it that the labor has not been in vain. Each year more farmers are waking up to the fact that there is money to be made from poultry and as a consequence are taking more and better care of their stock. And with this new interest in the flock comes the natural desire for better bred stock.

WHY DON'T THEY LAY?

Judging from the many inquiries coming to hand there are many flocks of poultry that are sorely taxing the patience of their owners. Why are they not laying, and how to make them lay, are the questions. Were it not for the fact that a vast majority of the flocks might thus be described, the high prices for fresh eggs that have ruled for two months would seldom or never occur. Now and then a flock proves to be an exception, and provides eggs every day in the year. This, however, is generally the result of skilful management and care. It is when hit and miss methods are not tolerated. It is when the poultry is recognized to be the equal in importance to any other factor entering into our daily cares. It is where intelligence and common sense were exercised in the care of the parent stock, as also the eggs from which the flock were hatched. It is where the chicks were carefully brooded and fed on a balanced ration (a variety), that produced a good all-round development. It is where the runts and poorly developed ones (and sometimes there are many such, especially in incubator hatches), are separated from the choicest birds—those of thrift and vigor—and not permitted to eventually contaminate the flock with vermin and disease. It is where the cockerels and pullets were separated when the first and smartest bird tried first to crow, and the pullets were given their permanent and separate quarters and treated very much as the laying hens should be cared for.—H. L. Blanchard.

MORE USE FOR EGGS.

A mustard plaster made with the white of an egg will not leave a blister.

A raw egg taken immediately will carry down a fish bone that cannot be gotten up from the throat.

The white skin that lines the shell of an egg is a useful application for a boil.

White of eggs beaten with loaf sugar and lemon relieves hoarseness—a teaspoonful taken once every hour.

An egg added to the morning cup of coffee makes a good tonic.

A raw egg with the yolk unbroken taken in a glass of wine is beneficial for convalescents.—Medical Record.

FARM INDUSTRIES FOR WOMEN

Continued from first page.

ing. The sale of butter is helped or hindered by its appearance as well as by its quality.

People like to see things they are going to eat put up in an attractive form; and often with a little care in this respect the selling price of butter can be increased one or two cents per pound. A neat crock is a satisfactory package, or the butter may be put into square prints and these packed in parafined pasteboard boxes.

Those who have the best success with farm dairy butter establish a permanent trade, and supply their customers regularly each week. Trade of this kind is very profitable when fair prices can be secured. It has the advantage of continuing throughout the year instead of being very dull at one time and very much overstocked at another. Care should be taken to arrange the dairy so that a large proportion of the cows will be milking in the winter season.

There is an opportunity also for the farm dairy woman to use her milk for making cheese. Statistics show that the great bulk of cheese is made in factories. There is no advantage of competing with well-made factory cheese. But in the farm dairy, small cheese can be made and of different styles or kinds from those produced by the factories. If the quality of such cheese is good and uniform, it need not require more than ordinary business ability to develop a good trade for it.

When conditions are favorable there is no more profitable way of disposing of milk than its sale at retail in the form of raw milk and cream. This business has the advantage of running throughout the year and is not subject to great fluctuations on account of changes of seasons. In these days we hear much about the need of better milk as well as the need of better foods generally and better sanitary conditions which have to do with the public health. The dairyman who produces his milk in a sanitary way should be able to secure customers for it at fair prices. But he must first convince the public that his work is being carried on in the proper manner and that he really has what they want.

* * *

Bee Culture.—Success at keeping bees depends on various things: Steady nerve, calm movements, patience, a system not too susceptible to the sting of bees, a liking for the work, and a location suited to the needs of the little honey makers. If a woman has these necessary qualifications she may feel very safe in becoming a bee-keeper. Many women have thus added to the family income and some whom we have known have supported the family entirely by this work, which they found at once interesting and profitable. Several women of our acquaintance have bought immunity from the drudgery of the kitchen work by money which they have earned in the apiary. While there is some hard work in attending the bee-hives, especially in preparing the apiary for winter, yet much of the labor is enjoyable, and much of it is done in the open air.

* * *

A Garden.—Some women shrink from gardening as a back-aching, knee-tiring industry. But perhaps these same women sew till the ribs are sore and scrub till the sides and knees ache. To be sure, the peas should be picked in the early morning, and the skirts become bedraggled. Short skirts, made of denim, are good for gardening—much better than wornout long skirts not good enough for anything else. An hour in the early morning and an hour at night are sufficient to make a garden one is proud to show to the neighbors. The woman who works it has had fresh air, and working in the dirt is not considered unhealthful.

* * *

Fruit Growing.—Women are becoming students of horticulture; and, while a few years ago it was an experiment, now her success is an established possibility. Not alone is she successful with raspberries, strawberries, blackberries, currants and gooseberries, but with the larger fruit as well. She has become an orchardist, and that with much pleasure and profit to herself.

It is not possible in this brief discussion to point out the conditions for success in raising fruit, and the pests that are to be combated and the results to be attained. Books on gardening and the raising of fruits, government bulletins, as well as those of the experiment stations all are available and healthful in this study.

* * *

Weaving.—The revival of hand weaving seems to be near, and looms which have been put aside for years are now in demand. This would indicate that weaving is not a caprice of fashion, but that it has genuine value. The power loom has superseded the hand loom for most purposes; still the commercial value of hand made textures has stood the test of time. It is a common thing for persons to note that laces and other fabrics have rare value because they were hand made. If a woman has material and the loom she can easily add to her revenue by weaving rugs, which are taking the place of carpets. This does not mean that the old-time saffrons, magentas and purples are in demand, but that good colors and combinations, with a satisfactory warp, may produce rugs for which there is ready sale, if one is in the right locality.

CROPS TO BE PRODUCED BY ELECTRICITY.

It is quite within the bounds of possibility—given an adequate supply of electricity at a sufficiently cheap rate—that in the not very distant future Great Britain may once more be able to produce the bulk of the wheat she consumes, and to find employment for a much greater proportion of her sons upon her own soil. The fields of the future will be covered in with a network of wires, which will radiate high-tension electrity through the crops beneath, and bring them to a fruitfulness such as the old-fashioned sunshine could not possibly bestow. Such, at any rate, is the potential outcome of experiments which Mr. J. E. Newman, an electrical engineer, is carrying out on a farm at Iron Cross, midway between Evesham and Alcester. Twelve of the acres included in the experiment have been sown with wheat, seven with barley, and there are small plots of other crops. In the case of almost all of them Mr. Newman confidently expects that germination will be hastened and the yield increased as a result of the discharge of electricity from the wires. In the case of the wheat, he says, he will be disappointed if the yield, both of grain and of straw, be not 25 per cent. greater than it would be otherwise. But it would be well to wait for the result.

The Boys and Girls Magazine published at Ithaca, N. Y., is devoted to nature study and kindred subjects of interest and profit to both children and adults. The low price of fifty cents per year should give it a place in every family where there are small children.

The Pomona Fruit Growers' Association, having discontiued fruit drying, have on hand 9000 drying trays, 500 picking boxes, and two graders which can be had at a great bargain by addressing R. D. Russell, corner Phillips and Ellen Sts., Pomona, Cal.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

Queries and Replies

MANGE ON DOGS.

Editor Cultivator:—Please give me a cure for mange on dogs.—J. L. P., Anaheim.

Scrub well every two days, using one dram of bichloride mercury to one-half gallon of water.

A "SQUASHED" BUG.

Editor Cultivator:—Will you kindly tell me through the columns of your paper what kind of insect I inclose and what to do to get rid of them? They seem to be in swarms out of doors. If you would kindly tell me what to use to exterminate them completely.—A Subscriber.

Bug enclosed had been ground to pieces under a postal stamp. Would advise you to send them to S. A. Pease of your own county, or send us specimens (more than one) in a box, so they will reach us in good condition.

ROSE BUSHES.

Editor Cultivator:—I would kindly ask you to inform me through the columns of The Cultivator a recipe for rose bushes or rose bush plants. We have a few large rose bushes, and the new growth especially, also other leaves, are showing large signs of dying out. Must be that some insect is working on them, for moisture they have plenty.—R. B., Redlands.

Nothing at all can be told from the very slight description given. Try again; we are anxious to help you.

RYE GRASS.

Editor Cultivator:—Please tell me name of enclosed grain, which is growing thickly among my wheat.—R. J. W., Oleander.

A Rye Grass (Lolium, probably L. temulentum), which has come up very thickly this season among all cereals. Will endeavor to learn its food value and publish a note on same.

MATURITY OF NOTE.

Editor Cultivator:—If a person gives a note which has become due, can the party holding the note commence suit, provided the note giver is unable to pay but tenders another payment of interest in advance? How long after the note becomes due can suit be entered?—W. O. B.

As soon as the note becomes due the tendering of further interest will in no way stop its collection, excepting by consent of the holder of the note, and suit may be begun at once if so desired.

OWNERS OF ROADS.

Editor Cultivator:—Kindly answer: (1) Has the owner of land along a roadway entire control over shade or fruit trees planted by him according to State law, within the limits of the public road, and can he remove them when he sees fit?

(2) Can the owner control the grass or pasturage bordering the road on his side. or can drovers. travelers and others pasture stock there without his consent?—B. A. B., Ventura.

The question of law referred to above may be modified in various counties or municipalities according to the local ordinances, but from the standpoint of the State law it may be said that the owner of the land practically controls the trees and growth which may be in the roadway, provided they are planted as the query says. according to State law. At least such is the general custom which is often abused in this, that beautiful shade trees are sometimes removed to give to the owner of the adjoining land a little stove wood. much to the detriment of the beauty of the section and a loss to the traveling public.

As to pasturage or control of growth along the street, if such is permitted by the authorities. it would be controlled by the adjoining property owner. The roadway, however, is supposed to be for public use as a highway. Should campers or travelers see fit to make an attempt to use the pasturage in front of a man's property, he certainly has a right to order them off and secure the enforcement of his order.

CANNING BEANS.

Editor Cultivator:—As a subscriber to your valuable paper I desire to ask if you can give me a formula or recipe for canning Lima and string beans for home use? An answer through the columns of the Cultivator would be greatly appreciated.—Mrs. M. C., San Diego.

String beans are canned either entire or else are strung and snapped into the usual lengths for cooking. They are then blanched by cooking for fifteen minutes in a kettle of water containing an ounce of baking soda to every four gallons of water. This fixes the green color. If you have a wire basket it is convenient for this work, if you have not, use a ladle for the beans, lifting them from the boiling water into cold water, leaving them in it until cold. Drain them and pack into the cans with your hands, making the cans as full as possible. Then cover them with a cold brine made as follows: Boil a pound of salt in five gallons of water for ten minutes, strain when cold, through a piece of cheese cloth. If tin cans are used (and they are far the easiest to handle) solder the can, leaving only the small dotting hole open, put into boiling water for eight minutes, remove the cans, solder up the little vent hole and return to the hot water, cooking them for one hour and three-quarters. Remove and cool in cold water. If glass jars are used put the rubbers on but leave off the covers for the first cooking, then tighten up the covers as firm as possible before the second cooking. Glass jars are not apt to keep as well, for they are much harder to seal up quickly enough to exclude all the bacteria in the air. Lima beans are prepared in the same way, first blanched with soda, then receiving the same processing. Only the young green beans can be used and even these are better if an ounce of soda is added to the preserving brine. I personally would advise you not to can Limas, as they are regarded by expert canners as difficult and not certain to be perfect when the cans are opened. Why not pick them young and dry on board trays in the open air . If this is done, be sure to take them up and put away in light boxes, while they are hot from the sunshine. Taken in this way there is little danger of weevils, or worms troubling them.—Minna E. Sherman.

STRAWBERRY TROUBLE.

Ed. Cultivator.—Enclosed under separate cover I send you a sample of strawberry plant and would like to find out what the trouble with them is. The bed was set out a year ago and yielded a big crop last season, but put no runners out. This spring they have not done anything at all, and don't act like they would. Have had good care, use a wheel hoe and cultivator and do not use a horse cultivator in them. Can you tell what is the matter and is there a remedy.—A subscriber, El Modena.

A careful examination of the plant sent shows nothing worse than a bad case of mould, caused, no doubt, by the excess of wet, cloudy weather, on old weak, but compact plants. Rust was also quite noticeable but this would not cause such serious results as noted. If this plant was set out but a year ago, a mistake was made, for it has a well defined "stump," showing it to have passed the age of usefulness. We think that with bright clear weather, the plants will come out all right; if not we would get some fresh young stock.

RYE GRASS OR CHEAT.

Three subscribers have each sent in, growing among their cereals, claim- during the past week, a foreign grain ing that whereas wheat, oats, or barley were planted, the grain which sprung up was not among the seed sown.

The specimen sent is Lolium temulentum, the plant commonly called "cheat" in California. This plant has a bad reputation abroad, even charged with being poisonous to stock, but California experience, so far, disagrees with European, for the plant is valuable for feeding when green and makes a fair kind of hay if cut before it hardens too much. We, therefore, see no reason to warn people against it and it would avail little if we did, because the whole state is full of the seed of the plant, and it becomes exceedingly abundant whenever the season turns out to be unusually wet.

This is the plant which the California farmer is apt to think wheat and other grains turn into when the season is wet. The cheat which "wheat turns into" in the Eastern states is an entirely different plant. Those who take a more rational view of the thing wonder why it is that wheat would turn into one plant in California and into an entirely different plant in the East under the same conditions. The solution of the matter is, of course, that the wheat turns into nothing by the rotting of the seed. These two plants being possessed of very hardy seed pop up under conditions adverse to wheat or other cereals and occupy the land.

EASY TO PUT ON

a Permanent Protection

Save the expense of a professional roofer. Any man, any workman, with a knife, a hammer, an old paint brnsh and a little care can lay a perfect roof.

Pioneer

Rubber Sanded Roofing

Is the best protection for any sort of roof. Tar melts, clogs the drain pipes, smears the building. Shingles warp, curl and split. Tin rusts rapidly. Metal roofs quickly become leaky. ***PIONEER RUBBER SANDED ROOFING*** overcomes all these difficulties. That wear-proof surface of hard flint sand adds years of wear to the roof. We will gladly send samples and prices. Booklet "D" will tell you all about the best roofing and building papers for every purpose. It is free.

COUNTRY LIFE.

Happy the man who tills his field
  Content with rustic labor;
Earth does to him her fulness yield,
  Heap what may to his neighbor.
Well days, sound nights, oh, can
  there be
A life more rational and free?

Dear country life of child and man!
  For both the best, the strongest
That with the earliest race began,
  And hast outlived the longest;
Their cities perished long ago;
Who the first farmers were we know.

Perhaps our Babels too will fall;
  If so, no lamentations,
For Mother Earth will shelter all,
  And feed the unborn nations;
Yes, and the swords that menace now,
  Will then be beaten to the plough.
    Richard Henry Stoddard.

BACK TO THE SOIL.

Sociologists are looking more and more toward decentralization of population as a remedy for the squalidity and misery found in great cities. It is admitted by everybody that the life involving the sweat-shop and the slum is less healthy physically, morally, industrially, and politically, than the old life on the farm. The effect upon the individual of pure air and cleanly surroundings can hardly be estimated. A business of one's own, if it is small, does vastly more in the development of character, the foundation of all good citizenship, than drudging along eternally subject to the will or perhaps the whims of employers.

But the city has vast social advantages, and the country has been lonely beyond measure. Human fellowship is one of the strongest of sentiments, and almost any sort of hardship will be endured in preference to isolation. Everybody agrees that it would be well for the people in the city slums to get back to the soil. How they can be induced to do so is the problem.

It is obvious that the best way is to show the persons most interested that they can better their condition, and at the same time sacrifice few of the social advantages enjoyed in the city. Thanks to the march of invention which has brought about city congestion, the tendency now seems to be toward decentralization. Cities are spreading out. Suburban districts are becoming the favorite places of residence of the well-to-do as well as the wealthy, at least during a portion of the year. In some of the older cities residence property near the center of the city is positively falling off in value, while values are rising in the suburbs. Rapid transit makes it more and more feasible to live some distance from one's work. The movement is back toward the soil.

In London colonization in suburbs is being worked out as a means of relieving the over-crowded tenement districts. New York is sending its population into Jersey and up the Hudson for dwelling places. With the development and cheapening of rapid transit it is pretty certain that this movement will increase in force.

Even some manufacturers have taken the hint, and their plants are built some distance from trade centers, where their employers may have room for cottages and gardens.

THE CITY AND THE COUNTRY.

The Reverend Robert Collyer made the remark on one occasion that during his twenty years residence in Chicago he had not known of a single man who had come prominently to the front in any pursuit who was born and bred in a large city. The leading men in every calling—Judges, lawyers, clergymen, editors, merchants, and so on—had been reared in the country, away from the follies, the vices and the enervating influences that are known to exist in all large towns. Fashion reduces all young men and women to the same dull and uninteresting level. New York is now an old city. It has produced generations of men. How few of them have ever made their mark, there or elsewhere! It cannot be said that they go into other parts of the country and there develop the higher forms of manhood. They are never heard of except in the aggregated, concrete form of "our fellow-citizens." How much of a man is due to qualities born in him, and how much to his early environment, no philosopher has been able to tell us; but it is impossible to conceive of a sagacious intellect like that of Lincoln, of a glorious mind like Webster's, emerging from the false glitter and noisy commotion of the city. We think of Washington, the patrician sage, pacing among the stately oaks of old Virginia; of Jefferson in his country-seat, and of John Adams tilling his farm in Massachusetts. These men, it is true, flourished at a time when there were no large cities in the United States. But later on we see Lincoln and Garfield reaching the topmost round of fame's ladder from the obscurity of country homes. Not one American president, from first to last, was born in a city.

FARMING.

While the city is refreshed and renovated by the pure tides poured from the country into its steamy and turbid channels, the cultivation of the soil affords at home that moderate excitement, healthful occupation, and reasonable return, which most conduce to the prosperity and enjoyment of life. It is, in fact, the primitive employment of man,—first in time, first in importance. The newly-created father of mankind was placed by the Supreme Author of his being in the garden which the hand of Omnipotence itself had planted, "to dress and to keep it." Before the heaving bellows had urged the furnace, before a hammer had struck upon an anvil, before the gleaming waters had flashed from an oar, before trade had hung up its scales or gauged its measures, the culture of the soil began. "To dress the garden and to keep it!" —This was the key-note struck by the hand of God himself in that long, joyous, wailing, triumphant, troubled, pensive strain of life-music which sounds through the generations and ages of our race. Banished from the garden of Eden, man's merciful sentence—at once doom, reprieve and livelihood—was "to till the ground from which he was taken," and this, in its primitive simplicity, was the occupaton of the gathering societies of men.

To this wholesome discipline the might East, in the days of her ascendency, was trained, and so rapid was her progress that in periods anterior to the dawn of history she had tamed the domestic animals, had saddled the horse, and yoked the ox, and milked the cow, and sheared the patient sheep, and possessed herself of most of the cereal grains which feed mankind at the present day. I obtained from the gardens of Chatsworth, and sent to this country, where they germinated, two specimens of wheat raised from grains supposed to have been wrapped up in Egyptian mummy-cloths, 3,000 years ago, and not materially differing from our modern varieties; one of them, indeed, being precisely identical—thus affording us the pleasing assurance that the corn which Joseph placed in Benjamin's sack before the great pyramid was built was not inferior to the best of the present day.—Edward Everett.

FARM LIFE.

Agriculture is the greatest among the arts, for it is first in supplying our necessities. It is the mother and nurse of all other arts. It favors and strengthens population; it creates and maintains manufactures, gives employment to navigation and materials to commerce. It animates every species of industry, and opens to nations the surest channels of opulence. It is also the strongest bond of well regulated society, the surest basis of internal peace, the natural associate of good morals.

We ought to count among the benefits of agriculture the charm which the practice of it communicates to a country life. That charm which has made the country, in our own view, the retreat of the hero, the asylum of the sage, and the temple of the historic muse. The strong desire, the longing after the country, with which we find the bulk of mankind to be penetrated, points to it as the chosen abode of sublunary bliss. The sweet occupations of culture with her varied products and attendant enjoyments are, at least, a relief from the stifling atmosphere of the city, the monotony of subdivided employments, the anxious uncertainty of commerce, the vexations of ambition so often disappointed, of self-love so often mortified, of factitious pleasures and unsubstantial vanities.

We deplore the disposition of young men to get away from their farm homes to our larger cities, where they are subject to difficulties and temptations, which, but too often, they fail to overcome.

Depend upon it, if you would hold your sons and brothers back from roaming away into the perilous centers, you must steadily make three attempts—to abate the taskwork of farming, to raise maximum crops and profits, and to surround your work with the exhilaration of intellectual progress. You must elevate the whole spirit of your vocation for your vocation's sake, till no other can outstrip it in what most adorns and strengthens a civilized state.

CLOSE TO NATURE.

To walk with the breeze upon one's brow, to trample the level grass exuberant with freshness, to climb upon the mountain, to follow through the meadows some thread of water gliding under rushes and water-plants,—I give you my word for it, there is happiness in this. At this contact with healthy and natural things, the follies of the world drop off as drop the dead leaves when the spring sap rises and the young leaves put forth.

A GUIDE.

"I shall pass this way but once. If, therefore, there be any kindness I can show, or any good I can do to my fellow human beings, let me do it now. Let me not defer or neglect it, for I shall not pass this way again."

THE SADDEST YET.

Maud Muller in her cozy home
Raked her head with a fine-tooth
  comb.
The judge rode by in his runabout
And advised the maiden to smoke 'em
  out.
Maud tossed her head, and said: "Oh
  fudge!"
And told her beau, and he licked the
  judge.

WOMAN'S FARM WORK

Many a farm and farmer would go to rack and ruin, morally and financially, were it not for the woman's influence and the wife's help. The average farmer and farm are what they are, largely because of the wife.

Sound health is fundamental in human success. Material and ethical development depend upon this, for, while individuals in poor health and with feeble digestion may accomplish much and enjoy life, we all know that for the mass, the vital essential is an organism sound and normal from head to foot.

To properly nourish the body and wisely to insure its health, physical and moral, are duties in every family that devolve upon the wife. To fulfill her duties in this respect, a woman requires genius of the highest order, intuiton, knowledge, experience, tact, sense, patience—all the attributes of perfect and successful motherhood and womanhood. Few men on the farm understand the qualities possessed by the women who toil by their sides. Every woman possesses these qualities to a degree; life, at its best, depends upon the extent to which she is able to develop and mploy them.

The responsibilities of women are complex and they must fit themselves to do their work. The educational needs of young women who are to do the work of the farm are but feebly realized and poorly provided for in schools. The manner in which a woman rises to her responsibilities on the farm, in view of her inefficient preparation for her duties is phenomenal. The successful woman on the farm has the most glorious success posible in a woman' life. Woman's work on the farm is just as important, just as satisfying as man's.—Exchange.

SUGGESTIONS FOR THE HOUSEWIFE.

For wagon grease or tar spots rub well with kerosene while the grease is fresh; then wash out in cold soft water, using no soap.

Irons that have been put away sticky should be well scraped with a thin knife, then rubbed with a rough cloth moistened with kerosene.

To cleanse a kitchen range, always after using, rub well with an old newspaper, which removes the grease, and then black it when cold.

Kerosene will remove ink stains and fresh paint, while nothing takes out blood stains better than cold soapsuds to which kerosene has been added.

Olives soon grow moldy when the bottle containing them is opened. A little scraped horseradish laid over them will keep those remaining in the bottle fresh and sweet.

Pulverize and mix one ounce each of cedar, rhubarb and cloves, put in bags and hang in your clothes closets; they will prevent moths and give a good, wholesome perfume to your clothing.

To remove a glass stopper pour hot water over the neck of the bottle. The heat causes the glass to expand and, it then being considerable larger than the stopper, readily releases the latter.

A temporary way to serve ice cream is in jelly moulds. Turn the jelly out on a plate and scoop out the center with a teaspoon dipped in hot water. Fill the thick shell of jelly with ice cream and serve at once.

Instead of codfish balls, serve baked codfish. Cream enough desiccated codfish to make a pint, add a few grains of paprika and from one-quarter to one-halp a cup of grated cheese. Fill scallop shells with the mixture, cover with buttered crumbs and bake till a nice brown.

FATHERS AND CHILDREN.

A gentleman met a friend near his own home and they joined company on their way to business. Before they had gone far they met a trim nurse maid wheeling a baby carriage, in which was a fine six-months-old baby.

"That is a jolly-looking chap," said the gentleman.

He hastily glanced at his watch, and finding that he had a moment to spare, stopped the carriage and chirruped to the baby, who smiled genially in response.

"I have a little one at home about this one's age,' observed the gentle man to his friend. "By the way," he continued, to the maid, "whose baby is this?"

"Your's, sir," responded the nurse in much astonishment.

Of course the story was too good to keep and the faithless friend put it at once into circulation.

How often are men heard to say: "I leave the training of my children entirely to my wife;" or "I never interfere with the dicipline; my wife attends to all that." Another type of father, still, assumes in his family the role of high lord executioner.

"If you don't stop that," says the fond, foolish mother, "I will tell your father on you."

In some families there is no threat so dreadful, and I have known a father to tell laughingly, as if it were a good joke, of the poor scared little faces which were lifted to his when he appeared suddenly among them with a rattan in his hand, inquiring whether there were any whippings to be dealt out that afternoon."

Alas, how far away these poor, earthly fathers are from the fatherly ideal which is set forth in the Bible! And how can they illustrate to a child anything of the fatherhood of God?—Selected.

NOT TOO YOUNG TO LEARN.

A mother of a young family who reads The Cultivator asks if I think little children can be impressed by talking to them of the danger of infection and warning them to be careful at school and elsewhere. That it seems to her she makes so little impression upon them.

Do not be discouraged, my friend, for it is remarkable how young children do learn, and they can be taught to guard against all such trouble, usually, is my experience and observation. Much contagion is transmitted because children have not been carefully instructed along such lines. The hands may carry the germs of infection secreted in the dirt under the little nails. Children can be taught not to use one another's handkerchiefs or towel, or wash in the same basin at school, etc. Little children are so innocent usually that they do not know how to refuse a friend their handkerchief to wipe fruit from their mouth and hands, but I heard a little boy say to another: "Oh, no; I cannot let you use my handkerchief; mother said I must not."

With catarrahal colds, sore throats and eyes, it is best to have a child's handkerchiefs and towels they use laundered to themselves, and wash them in a hot, boiling suds with Pearline in it to eat the soil quicker, and it cleanses so thoroughly. Some put borax in the wash water to kill germs. It is best to study and observe all

BURN AIR AND SAVE FUEL
You can do it with the
HAGUE IMPROVED DOMESTIC OIL BURNER
It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to
Hague Domestic Oil Burner Co, 810 So. Spring St., Los Angeles, Cal.

A Delightful Way to Go East
Is Via The
Scenic Salt Lake Route
Some day you will go Back East again. Perhaps this summer. When you do, why not go over the new short line to Salt Lake City, thence over the Union Pacific or the Rocky Mountain Scenic Line, Denver & Rio Grande. There's
BEAUTIFUL SCENERY along the line through California, Nevada and Utah. 'Tis not entirely a desert region. You will be surprised when you see the reality.
SEE SALT LAKE.—No extra expense is necessary to stop over a day at Salt Lake City. There's much to interest you in the old Mormon City.
THROUGH SLEEPERS are run on both Salt Lake Route trains from Los Angeles. THE LOS ANGELES LIMITED with standard and tourist runs solid though to Chicago via Ogden, Union Pacific and North Western lines. There's nothing finer in train equipment.
SALT LAKE ROUTE
THE OVERLAND carries every day tourist sleepers from Los Angeles to Chicago via D. & R. G. & Burlington Route, to St. Louis via Union Pacific & Wabash Railroads and to St. Louis twice a week via D. & R. G. & Missouri Pacific Railways. There is also every day a Standard Sleeper through to Denver via D. & R. G.
DINING CARS are carried on both THE LOS ANGELES LIMITED and OVERLAND in which meals are served a la carte. You pay for what you want at reasonable prices and the service is the best possible.
EREE CHAIR CARS are run on THE OVERLAND to Salt Lake City connecting with similar cars on other lines there. These cars are very comfortable. Save sleepers expenses if you wish.
EASTERN EXCURSIONS at much reduced rates will be run by the Salt Lake Route this summer. From all stations in California tickets will be sold as follows for round trip:
May 25, 26 and 27—New Haven, Conn. Rate 92.10. Return limit Aug. 31st.
June 6 and 7—Louisville, Ky. Rate $75.75. Return limit 90 days.
June 6 and 7, July 2 and 3, August 7, 8 and 9.—Chicago and Duluth $72.50 St. Paul and Minneapolis, $70.00. St. Louis, Memphis and New Orleans, $67.50.
Missouri River points and Fort Worth and Houston, Tex., $60 00.
Also reductions to Atlantic Coast Cities. See Salt Lake Route agents for full particulars and plan your trip to travel over this route either going or returning.

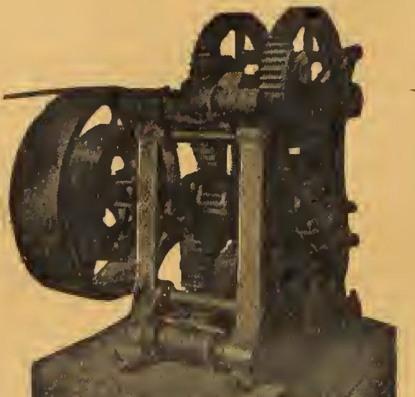
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas. Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosph r bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the oest by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

San Francisco Markets.

San Francisco, June 19, 1906.

There was a good demand for eggs and prices were held steady at unchanged figures. Butter was in fair request for the better grades. Cheese was quiet, but steady.

The ruling prices of the San Francisco Wholesale Dairy Produce Exchange yesterday were as follows:

Butter.

BUTTER—Fresh California, extra, 19c; firsts, 18½c; seconds, 17-17½c; packing stock, firsts, 15-16c; seconds, 14c.

Cheese.

CHEESE—New California fancy, 9½c; firsts, 9c; Young America, fancy, 11c; Eastern, New York fancy, 16½-17c; western, new, 15c.

Eggs.

EGGS—Fresh California selected, 20c; firsts, 19c; seconds, 18c.

Poultry.

Hens of large size were in demand and full prices were readily paid for desirable stock. Game was dull and neglected.

POULTRY—Old roosters, per doz., $3.50-4.50; young roosters, $5-7; fryers, $3-4.50; broilers, $2.50-3.50; hens, small, $4-4.50; large, $5-6; live turkeys, per lb., nominal; dressed turkeys, nominal; ducks, old, nominal; young, nominal; pigeons, per doz, $1; young, $1.25-1.50.

GAME—Hare, $1.25-1.50 per doz.; rabbits, $1.50-2.

Fresh Fruits.

The leading fruits in the market sold yesterday at the following prices: Strawberries, chest, $4.50-6 for large varieties and $7-11 for Longworths; apples, $1.50-2.25 per box; cherries, black varieties, 60-90c per drawer; white, 50-80c per drawer; cherries, in bulk, black, 6-10c per lb; white, 5-8c; gooseberries, 50-75c per drawer; oranges, navels, $2.50-3.50 per box, with a few second grade at $2 per box; lemons, $2-4.50 per box; Mexican limes, $4.50-5 per box; bananas, 75c-$1.75 per bunch; pineapples, $2-3.50 per dozen; currants, $4-6 per chest; loganberries, per chest $3.50-5; cherry plums, per drawer, 30-40c; peaches, 50-90c; apricots, $1-1.50 for large boxes and 50-75c for small; blackberries, per chest, $4-6.50; raspberries, per chest, $5.50-8.

Dried Fruits.

Prices for carload lots, 1905 crop, free on board at California common shipping points, in bags, are per lb as follows:

Prunes—Choice, 4¼-4½c per lb, basis for the four sizes. For boxed fruit add ¼-½c per lb.

Apricots—Choice, 12-12½c; extra choice, 13-13½c; fancy, 14-14½c.

Peaches—Choice, 10-11c; extra choice, 11¼-11½c; fancy, 11¾-12c; extra fancy, 12-12½c.

Raisins—Loose Muscatels, 5-6c; seeded raisins, 5½-6½c; London layers, $1.50-1.60.

Vegetables.

Dealers sold vegetables yesterday at the following prices: Asparagus, $1.25-2 for small and $2.25-3 for large box; green peas, 75c-$1.25 per sack; rhubarb, 40-60c per box for small and 75-85c for large; string beans, 2-4c per lb; tomatoes, 75c-$1.25 per box; potatoes, new, 1-1¼c per lb; old Rivers, 75c-$1.10 per sack; Oregon, old, 65-90c; new crop, $1-1.50; Coos Bay, $1-1.15 per sack; onions, new 70-85c per sack; boxes, 25-50c; Oregon, $2-2.50 per cental, as to quality; Australia, $3.50-4; cucumbers, 85c-$1.25 per box; green corn, per doz. 12½-20c.

Live Stock Market.

CATTLE—No. 1 steers, 6½-7c; second quality, 6-6½c; third quality, 5½-6c; No. 1 cows and heifers, 5½-6c; second quality, 5-5½c; third quality, 4-5c; thin cows and heifers, 3-4c; bulls and stags, 2-3c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½-4¾c, gross weight; medium, 3½-4c; heavy, 3-3½c.

SHEEP—Per lb: Wethers, No. 1, 4½-5c, gross weight; ewes, No. 1, 4c-4½c, gross weight.

LAMBS—Per lb: Yearlings, 4½c-5c.

HOGS—Per lb: Hard grain fed, weighing alive 80 to 130 lbs., 6c; 130 to 150 lbs, 6½c; 250 to 350 lbs., 6c; rough heavy, 4-5c; common 3½-4c.

Flour and Grain.

Flour and Grain.

WHEAT—No. 1 Shipping, per cental, $1.30-1.32½; inferior grades, $1.25-1.27½; white milling, good to choice, $1.32½-1.37½, with fancy Bluestem, $1.40-1.42½.

BARLEY—No. 1 feed, $1-1.02½; common to fair, 95-98¾c; brewing, nominal.

OATS—White, $1.50-1.75; red, $1.35-1.70, according to quality; black, nominal.

RYE—$1.47½-1.55 per cental.

CORN—Small round yellow, $1.55-1.65; western, mixed, $1.32½; yellow, $1.30-1.37¾; white, $1.35-1.40 per ctl.

Hay and Feedstuffs.

The weekly trade circular of Scott & Magner descriptive of the hay market is as follows:

Arrivals of hay for the six days just passed have amounted to 3727 tons.

This amount is a heavy increase over the preceding weeks, and more than we have received in any one week since the great fire. In view of the fact that the city was practically bare of hay, this large amount has been practically taken care of without effort. The majority of all this amount consisted of old hay, as a very small proportion of it was of the new crop. There has been no change in prices in any particular, while the demand has been very active, and everything offered has been sold at once. It has not been practical to expect any higher prices than have recently prevailed.

The old crop hay is nearly exhausted, and will be entirely used up before the 1st of July. Considerable effort has been made this week to get new hay baled and shipped in certain sections, so as to relieve the situation here. If the transportation companies bring the hay forward a great deal of new hay will be offered on the market during the coming week. At this time, and on this market, new hay will sell very well, but what the effect of the heavy arrivals will be will be later determined. Quotations on new hay are very largely nominal.

Fancy old wheat hay sells from $17 to $18 and choice tame oat hay at $15.

There has not been much inquiry for alfalfa hay, nor has there been but very little coming in. One schooner-load of new crop first cutting alfalfa arrived yesterday, but was not offered for sale on the market.

Straw is rather dull under light arrivals and a most moderate demand.

HAY—Per ton, choice wheat, $13.50-18.50; wheat and oat, $12-16.50; oat, $10-15; barley, nominal; alfalfa, $10-12; new first crop, $6-9; stock, $7-$7.50.

STRAW—Per bale, 35-60c.

FEED—Mixed feed, per ton, $24-25; Calfalfa Meal, $23.50; carload lots, $22; Mealfalfa, per ton, $23.50; carload lots, $22.

BRAN—Per ton, $19.50-21.

MIDDLINGS—Per ton, $26-29.

GROUND BARLEY—Per ton, $24-$25.

FEED CORN MEAL—Choice grades, per ton, $31-32.

CRACKED CORN—Choice stock, per ton, $32-33.

OILCAKE MEAL—Mill rates in 5-ton lots, $37.50; jobbing, $38-38.50.

COCOANUT CAKE—In lots of 10 tons, $23; 5 tons, $23.50; less quantity, $24. Prices are mill rates and are subject to change without notice.

Beans and Seeds.

BEANS—Prices per ctl: Large white, $2.40-2.60; small do, $3.25-3.45; pea, nominal; Lima, $4.40-4.60; red, $3-3.50; pink, $1.85; Bayo, $3.75-3.85; Blackeyes, $5.50-5.65; red kidneys, $3.50-3.75; horse beans, nominal.

SEEDS—Brown Mustard, $4.50-$4.75; yellow mustard, $3.50-3.75; flaxseed, $2.50-3; canary, 6¼-6½c; alfalfa, 13c; rape, 2½-3c; timothy, 5c; hemp, 5½c per lb; millet, 3-3¼c.

DRIED BEANS—Niles, $1.75-1.85; green peas, $2-2.25.

Hops.

Desirable grades of California crop of 1905 sell at 8-11c per pounds; 1906 crop, for future delivery, 9-12c, with occasional sales at 12½c.

Hides and Wool.

HIDES AND SKINS—For round lots prices are as follows:

Wet Salted Hides—No. 1, sound, per lb, heavy steers, over 50 lbs, 13c; medium steers, over 48 lbs, 12c; heavy cows, over 50 lbs, 12c; light hides, 12c; kips, 13c; veal, 13½c; calf, 14c; stags and bulls, 8½c; No. 2 hides, 1c per lb. less.

Dry Hides—Per lb: No. 1, 22c; No. 2, 20c; dry kip, No. 1, 20c; No. 2, 18c; dry calf, No. 1, 24c; No. 2, 22c.

Horse Hides—Salted, large, $3-3.25 each; medium, $2.75 each; small, $2.25 each. Dry—Salted, $2-2.25 each, medium, $1.50-1.75 each.

Sheep Pelts—Long wool skins, $1.25-2 each; medium wool skins, 90c-$1.10 each; short wool skins, 50-75c each; shearings, 20-40c.

WOOL—Per lb.: Fall clip, San Joaquin and Southern Plains, 9-11c; Southern Mountain, 9-11c; middle and southern counties, free, 12-14c; do, defective, 10-12c; Humboldt and Mendocino, 16-18c.

Produce Receipts.

Receipts of interior produce for the forty-eight hours ended at noon yesterday were as follows: Flour, 3750 qr sks; 280 ctls wheat, 1830 ctls barley, 440 ctls oats, 80 ctls corn, 152 ctls cheese, 5 ctls tallow, 12,000 ctls sugar, 512 sks beans, 1850 sks potatoes, 230 sks onions, 515 sks bran, 350 saks middlings, 1027 tons hay, 10 tons straw, 148 ctks butter, 13,860 dz eggs, 57 rolls leather, 1526 hides, 1665 bdls pelts, 250 bxs raisins, 300 flks quicksilver, 635 rolls paper, 182 bbls lime, 500 gals brandy, 14,100 gals wine, 125 hd live stock, 25 bbls chickory.

CITRUS MARKETS

NEW YORK, June 19.—The orange market during the past week was not as active as had been expected. Some buyers bought largely but the bulk of purchasers did not and the result was a reduction in movement. Wholesale and retail prices were maintained at their high level of the preceding week.

Several reasons can be given for the decline in movement, the season is passing and at this time buyers and consumers alike cease to take an active interest as they do earlier. There is always more or less hesitancy about buying oranges in hot weather. The idea is that they will not keep sufficiently long to dispose of them profitably, and as this view is held by substantially all experienced dealers there is unquestionably much foundation for it.

On Saturday twelve cars sold at a slightly lower price than had been ruling and twenty-three cars auctioned on Monday met a like fate. At Boston on Saturday fourteen cars of citrus fruits brought extremely good prices. Twenty-three cars were sold today at a slight reduction. There is a strong and growing demand for lemons.

Foreign Lemon Sales.

NEW YORK, June 19.—Thirty-three thousand boxes of Sicily lemons were sold at auction here today. The cargo was in poor condition. Fancy 300s brought $3.50 to $4.25; choice 300s brought $2.50 to $3.00; fancy 360s brought $3.50 to $4.20; choice 360s brought $3.00 to $3.50; wasty stock brought $1.50 to $3.00. The market was lower. The next sale will be on Thursday, when 33,000 boxes will be offered.

California Fruit.

Six assorted cars of deciduous fruit were sold in Eastern auction markets by the California Fruit Distributors one day last week, three in New York grossing $2573, $4308 and $2409, respectively. Plums sold for $1.65 to $2, and cherries, $1.75 to $2.50. Two cars which were sold in Chicago realized $2266 and $2693 each, plums selling for from $1.80 to $2.70, cherries $1.80 to $2 and peaches $1.80.

A car sold in Minneapolis brought $1837, plums selling for from $1.70 to $2.20, cherries $1.65 to $1.80 and peaches $1,25 to $1.50.

RUPTURE
Absolutely corrected. Examinations free. I furnish addresses of my many soundly cured patients and contract to refund all money if unsatisfactory. Also make 14 kinds of Trusses, Elastic Stockings, Suspensories. Correct deformities and all physical weaknesses.

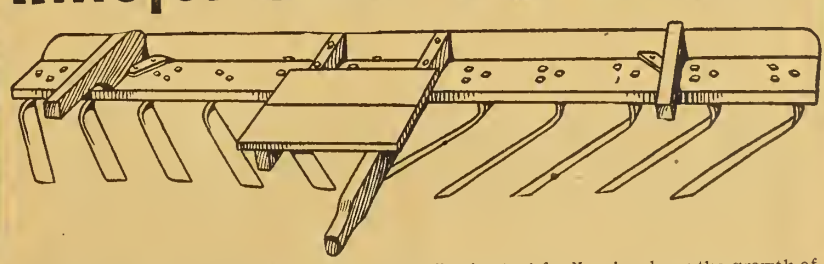
THE
Killefer Clean Cut Weeder


Is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. It does twice the work of any other tool with the same power. The knives overlap so it is impossible to miss any weed. Built in 6, 8, 10 and 12 foot sizes. The patented knives are so formed that they wear uniformly from heel to point, causing them to wear twice as long as any other blade for the same purpose. It is *the* tool for weed killing on any kind of cultivated land. Blades can be attached to cut in or out as desired.

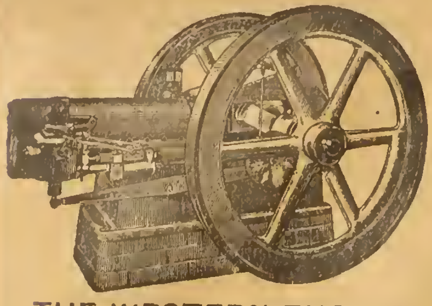
THE WESTERN GAS ENGINE



THE WESTERN ENGINE
Maximum Power at Minimum Cost

"From Factory Direct to User"

Designed and built by Western experts for Western use with Western fuel. In construction the Western embodies many original, yet practical ideas, which place it in advance of any other make on the market today. The simplest, strongest and best engine for

Irrigation, Power and Electric Plants.
Any Size from 5 to 500 H. P.

Burns cheapest fuel—gasoline, distillate or crude oil—with a saving of 20 to 40 per cent over any other style. Send for Illustrated Catalogue fully describing every detail of construction; tells how and why the Western excels all others; it gives the facts—the proof. Learn what Western engines are doing for others. Send your name today—ask for latest issue. A6.

P. K. WOOD'S

Improved Deep Well Propeller Pump

FOR IRRIGATING AND MINING

After devoting several years to deep study and experiments, and the expenditure of many thousands of dollars, this pump has been brought up to the point where it is practically indestructable, has an efficiency not to be excelled, and is ready to try conclusions with any deep well pump on earth. The principal improvement consists of a screw guide inserted in casing cupling and a ball bearing placed in each guide, which gives absolute protection to all parts of the pump, regardless of the amount of sand or grit which the water may contain. Write for catalogue and full description of these important improvements.

Loretta D, 141708, champion cow of all breeds in St. Louis dairy test, 330 lbs. butter in 120 days. Scored 90½ counts out of the hundred by Prof. Jas. Withycombe. Udder and milk-veins almost perfect. Now owned by Estate of W. S. Ladd, Portland, Oregon.

Diploma's Brown Lassie, 166688, second cow in order of merit in the St Louis dairy test, 312.56 lbs butter in 120 days. Scored 92½% of perfect scale of points by Prof. Jas. Withycombe. Now owned by the Estate of W. S. Ladd, Portland, Oregon.

RYE.

Rye is not half appreciated by the American farmer. It is very hardy, will grow on the poorest land, makes good winter and spring pasture, and if sown early enough makes good fall pasture. It is a good spring soiling crop, giving the earliest bite of green stuff. It makes a fair quality of hay if cut in bloom or before, and its straw always sells at good prices and makes the best of bedding for cattle and horses. It is also an excellent green manure crop for turning under in early spring. While it does not add nitrogen as the clovers do, it makes a great deal of humus, and thus improves the texture of wornout soils. It will grow in any section that can grow any of the small grains. Where corn or potatoes or cowpeas are grown after corn, rye may be sown in the corn at the time of "laying by," or may be sown on the stubble after the corn is cut, and be plowed under in the spring for any of the crops mentioned.

MITES AND LICE.

At this season of the year poultry of all kinds are infected more or less with lice and mites. There is a marked difference between the red mites and lice which is not easily distinguished by the average poultryman. Red mites are the insects that are often found on the roosts, walls and in the nest boxes of the poultry houses. They breed in the cracks and crevices of the woodwork. They are more like a minute spider in form than a louse. The Prussian Remedy Co. of St. Paul, Minn., make a liquid lice killer which they claim is a most effectual remedy for lice and mites. It is called the Prussian Lice Killer, and is applied thoroughly with a paint brush to the walls, roosts and nest boxes or with a sprayer. They advise the use of a sprayer as the vermin are killed both by the vapor and by contact with the liquid. They say that once rid of the vermin a light spraying on the roosts and in the nest boxes will effectually prevent them from appearing again. The use of the Prussian Lice Killer is very inexpensive as a 50 cent can is sufficient for the season for an ordinary flock. They also make the Prussian Lice Powder, a very effectual remedy easy to apply for dusting into feathers and the nest boxes. The Liquid Lice Killer is put up in 35c, 50c and $1 cans and the Lice Powder in 25c and 50c packages.

The country about Banning produces (this year) about 12,000 tons of hay and 60,000 sacks of grain.

Attention is called to the announcement in our advertising columns of the firm of Miller & Cahill, 1114-1116 J street, Sacramento, who make a specialty of manufacturing tanks, pumps, water pipe, well casing and pump valves. They are also agents for Aermotor Windmills. They succeed the old and well known firm of Miller Bros. & Co., and will take pleasure in quoting the lowest prices for first class goods.

The advantages offered students attending the Stockton Business College are briefly set forth in their advertisement in this paper. It is one of the oldest and most successful schools in the State and our farmer boys and girls who may be thinking of taking a business course should write this college for circulars and course of study.

DO YOU SELL EGGS?

Business is BUSINESS—and every man to his trade. Your business is what? Raising chickens—with an object—to have **eggs to sell.** Therefore **your business is making eggs.**

Do you make much money at your business?

You are laboring on day after day, in the same old way—and with the same small amount of profit.

WHY NOT MAKE MORE PROFIT?

You know how much you can sell your eggs for. So to make more money you must produce eggs for less cost and **produce more of them.**

CONSIDER AN EGG.

An egg is almost life itself—placed in a certain temperature, it hatches out into a **living, growing chick.** An egg therefore is very nutrious. One egg being equal to one pound of beef. An egg must contain everything needed to make a complete chick—including bone, feathers, flesh and blood, etc. Consider then what a hen must do to make an egg. She can only get the material from what is fed to her. An egg weighs about two ounces or more. Now if a hen has to make an egg from such food as bran or shorts, or chop feed or wheat, she will have to eat a pound of feed or possibly two pounds to get enough material to make an egg. But if the hen has Blood Albumen protein and fat, or feed containing such, she can produce an egg from four to five ounces of such food.

LESS FEED AND MORE EGGS.

Now when poultrymen feed COULSON'S IMPROVED MASH EGG FOOD to their hens they do not have to feed near so much feed, and at the same time, get so **many more eggs**—thereby producing eggs at a **less cost** per dozen—and making much **MORE MONEY** for the poultryman.

COULSON'S IMPROVED MASH EGG FOOD is a very rich feed—it is made with choice mill feeds and mixed with GOVERNMENT INSPECTED MEAT PRODUCTS, and other needed nutriments, all the component parts blended together by an ELECTRIC MIXING MACHINE. So that in this feed, the hen gets all **material** for making a **complete egg**—without loss of time, for it is easy made soluble and the hen becomes a regular EGG MAKING MACHINE—producing as high as two dozen in a month, from one hen.

The attendant gathering eggs. Results from feeding Coulson's Balanced Ration Egg Food. Healthy hens and plenty of eggs. 800 eggs from 1500 hens. Note the nice, healthy appearance of the hens. Coulson's foods are fed exclusively here.

BUY THE FEED THAT MAKES THE MOST EGGS.

When you buy feed don't figure how many pounds or how many sacks you are going to get for so many dollars. True ECONOMY is in buying the very best: so says Hettie Green the richest woman in the world. Make money by using your brains—BUY THE FEED THAT PRODUCES THE MOST EGGS. The feed that MAKES THE HENS LAY the most eggs—and with the smallest number of pounds of feed. THE MORE EGGS—the MORE PROFIT for you.

10 POUNDS EQUAL TO 20 POUNDS OF COMMON FEED.

COULSON'S IMPROVED MASH EGG FOOD is such a rich. concentrated feed—containing cooked, evaporated Beef Blood, Baked Meat Meal, fresh fine ground bone, etc., also containing the substances called gluten, phosphorus and other egg making substances—that 10 gallons will make a meal for as many hens as 15 gallons of common soft feed, and 10 gallons will produce as many eggs as 20 gallons of common mill feed. Therefore, you save money by buying COULSON'S IMPROVED MASH EGG FOOD.

$2.00 PER HEN PROFIT.

If you want less eggs, feed less pounds of the feed—if you want all the eggs you can get, give the hens all they will eat, and each hen will turn this feed into eggs at the rate of a dozen and a half to 2 dozen eggs per month per hen and each hen earning from $1.50 to $2.00 a year PROFIT FOR YOU.

$50.00

400 HENS GIVE $50 PER MONTH PROFIT.

H. S. Selecman at Elmira has 425 hens that laid 570 dozen eggs in April and over 600 dozens in May.

For morning meals he feeds COULSON'S IMPROVED MASH EGG FOOD—at noon 1-3 COULSON'S MASH and 2-3 Barley, and at night Wheat.

COST TO FEED THE HENS PER MONTH.

14 sacks COULSON"S MASH at $1.85	$25.00
Barley and Wheat	20.00
Total cost for month	$45.00
600 dozen eggs at 16c	$96.00

RESULT—425 hens fed on COULSON'S IMPROVED MASH EGG FOOD over $50.00 per month clear profit, and eggs only 16c at that.

COULSON'S IMPROVED MASH EGG FOOD.

That's the feed that brings **results.** Each ton contains the cooked blood (evaporated and pulverized) of HALF A HUNDRED GOVERNMENT INSPECTED ANIMALS. It also contains phosphorus, gluten and many other good qualities.

It produces eggs for from 3 cents to 5 cents a dozen less than other feeds and it also makes more of them—therefore by feeding your hens this feed you make **more profit** of **many extra dollars,** each month.

Take a ton and give it a trial. Ask for it at the feed stores.

In case they don't have it, write us for prices.

You will make more $ $ $ than ever before.

Methods of Grafting and Budding Grapes

By Prof. E. H. Twight

Grafting above ground was a common practice in the vineyards of the Romans, and their authors describe them carefully, while they hardly mention the underground graft. But for some reason, until recently most of these grafts tried upon the vines in modern times have failed. In the last ten years persistent efforts and successful experimentation in Europe have brought the discovery of new processes that have been very successful, and their use tends to become widely spread, though a few years ago the best authorities on viticulture condemned them.

* * *

Green Cleft Graft. This graft is used a great deal in Hungary; it is an ordinary cleft graft made on the green shoots of very young vines. The shoot used as stock is cut between the second and third leaves counting from the apex, and one and one-half to two inches above the third leaf. The scion is a similar shoot, the leaves of which are pinched. The ligature used is wool or raffia, and must be removed as soon as it begins to cramp the joint. This graft necessitates the decapitation of the stock, and is exposed to drying; and though used successfully on some vineyards of Hungary, it might not do as well in our drier climate.

* * *

Horwath Graft.—The Horwath graft consists in inserting a scion bud in the place of an eye of the stock; it is commonly used on fruit trees, but the excision of the bud on a vine cannot be done in the same way, because of the considerable protuberance existing at each node. The following method was adopted by Horwath:

A circular incision, penetrating the whole depth of the bark, is made 1-3-inch above and another the same distance below the bud; then on the right and left of the bud two longitudinal parallel incisions are made, joining the annular incisions. The bud thus prepared should be placed on a shoot of as nearly as possible the same diameter as that from which it was taken. But the indispensable point, which marks the difference between ordinary budding and Professor Horwath's method, is that the bud must be placed or inserted in place of another bud on a node.

The green shoot to be used as stock having been chosen, and on the latter the bud where the graft is to be made determined, the leaf on that node is removed. Two semi-annular incisions are made at the same distances as on the scion, and a single longitudinal cut is made passing through the bark, dividing the petiole in two and joining the annular incisions. Then with the spatula of the grafting knife the bark is lifted on both sides so as to form two flaps, as in ordinary budding. The flaps being open, the scion is inserted, the flaps brought over it and the joint ligated. A fortnight or twenty days after, this is cut off. This graft has given good results, but is a lengthy and delicate operation.

* * *

Salgues Graft.—The Salgues graft consists of fixing on a green shoot of the year an elliptic scion or shield carrying a bud at its center. It is budding, but so modified as to be considered a new method; the grafts obtained are perfect and the joints invisible except for a slight swelling.

On any internode of the shoot to be grafted a longitudinal incision is made with the grafting knife, penetrating the whole depth of the bark and about the length of the shield; with the haft of the grafting knife the bark is raised on both sides of the slit; the shoot is then bent inwards and the lips of the slit open easily. The scion bud is inserted and the shoot is left to spring up into its former position. The scion bud is then compressed by the bark, and the operation is completed by tying. The ligature should be removed a fortnight or twenty days afterwards.

San Joaquin Tokays. No Irrigation.

In order that the Salgues graft may be a success, it is necessary, first, that the stock should be in full sap, so that the lips of the slit may be easily raised; secondly, that the scion bud should be carefully selected.

When a green shoot is cut longitudinally on its entire length, different colorations may be noticed along the section; towards the apex the shoot has not yet begun to lignify, and the section is almost uniformly green in color, only slightly deeper above and below each node. The diaphragm of these can only be detected at the second or third node (counting from the top) by a slightly lighter color. Downwards the diaphragm becomes more distinct; finally, still lower, the pith begins to be indicated by a whitish tint; the scion bud should be taken only from the buds in which the diaphragm is already well apparent, but on the part of the shoot where the white pith is not noticeable. Each shoot will thus give two or three good eyes.

In practice, when one tried to bend a young vine-shoot there is no resistance at the top; then lower down it resists, and still lower down it does not bend but breaks. When the fingers can easily bend the shoot and feel a slight resistance, one is sure that the bud in that region, together with the one above and the one below, are suitable for budding. It is necessary to tie the grafted shoots to a stake, as they are thus better protected and do not dry out as easily as when close to the ground. This graft is simple, gives perfect union, and is getting to be very generally used. It is of great value in re-establishing vineyards on resistant stock.

The Salgues graft may be performed on mother stocks of American vines through the summer as shoots develop; one can bud sixteen inches apart on the canes with the object of obtaining grafted cuttings for the next season. We have seen contracts given out for this work for $6 a 1000 knitted grafts.

* * *

Besson Graft.—As stated above, the Salgues scion-bud is grafted on the internode of the shoot. The Besson graft like that of Horwath, is inserted on the node itself; but while the method of the Hungarian viticulturist is a true budding, that of Besson is an inlaying.

This graft is made in spring, at the same time as the ordinary bench graft. A special pair of shears is used, with curved blades perpendicular to the handle; it cuts and lifts the bud, the same operation being made on the stock and scion canes. The lateral portion detached must be a little under one-half of the thickness of the shoot; the cut is regularly curved and concave, and about one inch long.

On the stock, the second eye, counting from the top of the cutting, is cut out; while for the scion any one of the eyes on the cane is used. The scion-bud fits perfectly, as it is the same blade that makes the two cuts. The cuttings to be grafted should be sixteen inches in length their top being limited by a bud cut half-way through. The graft is tied with raffia, as in other bench grafts. So far, this graft tried on green shoots has not been a success, but on the ripe canes the results have been very good and the quality of the knitting is specially good.

* * *

Clarac Graft.—In the Claric graft, as in the Besson graft, a bud is substituted for another bud, but the process differs in many points. To prepare the stock an incision is made an eighth of an inch above a bud and the incision is continued in a straight section parallel to the axis of the cane, penetrating one-third of the diameter; the cut is stopped when the length is a little over the width of the blade under the base of the bud. The blade is removed, laid flat on the cane immediately under the base of the bud, in order to indicate by the width of the blade the point where the new transverse and oblique incision is to be made, to prevent the first section from spreading and to make a strong notch for the scion to rest upon.

The scion-bud is obtained in the same way, placed on the stock and tied.

Another way of making the Clarac graft consists in not removing the bud on the stock, only the longitudinal cut being made. The scion-bud is made in the same way but with a longer bevel; it is inserted in the slit prepared on the stock and tied. The bud left on the stock constitutes a sap drawer, which facilitates the knitting of the scion-bud. When knitting has taken place the stock bud is removed. The second method is more rapid. In both cases the ligature must be cut away three weeks after being made. Both methods have been successful.

Deciduous Fruit Culture

WALNUT CULTURE.

According to present indications Southern California is not going to have a cinch on the walnut industry in the future years. The high price of nuts for the last few years has boomed the industry until nuts are being planted quite extensively in other sections. At Salem, Oregon, I am told by people who live there, that they think they have a good locality for growing walnuts.

A walnut tree near Salem produced the past year forty dollars worth of nuts, and indications are that walnut orchards will be planted quite extensively in that locality in the near future. When the right nut is found for each locality walnuts will be produced all over the Pacific Coast. This will take some time. so for a number of years yet Southern California will be the main factor in the walnut industry.

In setting out a walnut orchard there are several things to be considered: Location. soil, water, and the kind of trees to set out—seedlings, budded or grafted trees. If grafted trees are used the kind of root on which they are grafted is an important item.

The Santa Barbara soft shell cannot stand the extremes of either heat or cold. One year when the thermometer indicated 115 degrees for part of three days, we lost half our crop.

If the tree is on the soft shell root, the soil should be at least three and one half to four feet deep and free from any hardpan, as the root is so soft it cannot penetrate very hard ground. The deeper the soil the better.

It is much more satisfactory to have water to irrigate with when needed than to attempt to grow an orchard without it.

The grafted walnut can be put on several different kinds of roots: Its own root, the hybrid root, eastern black walnut, and the California black walnut root. By having a variety of roots to graft on we can at least double the acreage of the walnut industry in California. We can graft on the root that will grow the best on the land we wish to set out.

Black adobe soil seems to be one of the best on which to grow walnuts; the trees are very vigorous and the foliage a very dark green. I think this land will average a larger crop of nuts than any other class of soil. Alkali or salt land, if not too strong, if the irrigation is managed right, will grow good trees if budded on the wild walnut, while on the soft shell root would not grow at all.

When we have a dry year the orchard on this class of soil must be irrigated in winter before the trees start out or the growth of the previous year will die back, and in some cases the whole top of the tree will die back to the body; under the same conditions winter irrigation will bring these trees out in the spring without any die-back. Five years' experience proved the above to be correct in my case.

The wild walnut root will grow in soil that is too hard for the soft shell root to penetrate, and is practically gopher proof. They do not like and seldom will touch the root. The wild root has the disadvantage of being inclined to sprout, and the sprouts have to be carefully removed without injury to the bark. If you injure the bark, in some cases the wound will not heal, but will begin to rot and slough just below the ground, and as a result the tree dies.

In selecting trees for an orchard the indications are that the majority of the growers are going to put out budded or grafted trees, if they can get them, as the demand is far in advance of the supply.

In selecting a graded walnut it is better to select one of the quality that the market demands—one with a name and a pedigree; a record of how many nuts it bears; a blight resistant, etc.

In buying a budded nut without name or pedigree you are in the same position as the man who puts out a seedling orchard. You have to wait until the nuts come into bearing to prove what they are going to do. After finding a desirable seedling to graft from it takes at least seven years to get an idea of what it is going to do.

The Hinde's Placentia Perfection is one of the grafted walnuts that has been grown long enough to be known to the trade. We put out five acres of these nuts in 1898. We have kept a record of the nuts produced. The third year they produced ¾ of a pound to the tree, the fourth year 5¼ pounds, the fifth year 12 2-3 pounds. the sixth year 17 33-100 pounds, seventh year 33 2-10 pounds, eighth year, 29 39-100 pounds, being eight years out and producing 99 pounds of nuts per tree in all.

This is not a large yield, but part of these years have been bad for blight and this tree is not any more resistant to blight than the ordinary seedling.

It is hard to find the equal of the Perfection nut as to quality, and it sells at an advanced price.

Now that many nurserymen are studying the grafting and improvement of the walnut, we may look in a few years to have trees immune from blight and producing much larger tonnage per acre than we now get.

In setting out an orchard a very important point is how far apart to set the trees for the most profit. I have spent two years in gathering data on this point. I find in the majority of cases the most profitable orchards have been set 40 feet apart each way, and trees up to 15 or 16 years old in the orchard bear as many pounds of nuts per tree as trees set 50 feet apart each way. An orchard with trees 40 feet apart contains ten trees more to the acre than one with trees set 50 feet apart. The expense is about the same in each except picking and caring the nuts of the ten trees of the former, which is 1 cent per opund.

A seedling tree in good condition will bear on an average up to 16 years an average of 525 pounds of nuts. If nuts sell at 9 cents per pound, the product of the ten extra trees in the orchard will make a net profit in excess of the 50-foot orchard of $420 per acre. When the orchard with the trees 40 feet apart is 16 years old, dig out every other tree in each row—break joints, and leave them "quincunox," that will leave only four trees less to the acre than the orchard with the trees 50 feet apart.

The following figures show the yield of the Kossert orchard in Anaheim during the past four years: In 1901, 10.000 pounds of nuts; 1902, 5,900 pounds; 1903, 5,500 pounds; 1904, 6,500 pounds.

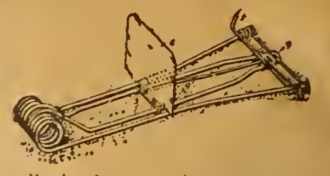
When you set out an orchard cut the trees off about five feet high; do it with a saw. Don't use a knife or shears. If cut with a saw they seldom die back to amount to anything, while if shears are used, they are inclined to die back more or less. Prune the trees as soon as the nuts are harvested, removing the branches that grow out from the under side of the lower limbs. This will relieve them of the weight and give them a better chance to grow up.—E. G. Ware.

FRUIT DRYING.

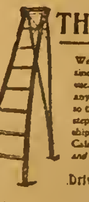
July ushers in the fruit season, and when the time comes there must be no delay, because delay always means loss from deterioration in the quality of fruit. Deciduous fruits must be watched very closely to get them in the best condition. If too green, the dried product will lack flavor, and if over ripe a certain mushiness will cling to the fruit when cooked.

As soon as apricots are out of the way peaches will come in. First the freestones and afterward clingstones. It is needless to say that the choicest dried fruits bring fancy prices and always find a purchaser when the inferior goes begging for a market. The extra care in drying first-class fruit is more a matter of individual skill and painstaking than of money, until ready to pack for market where a little extra expense is well laid out in improving the attractiveness of the fruit.

MACABEE GOPHER TRAP



Small, simple, sure. At all dealers. If your dealer does not handle same, send 20 cents in stamps and mention your dealer's name and get sample by mail postage paid at special rates. Manufactured by **Z. A. Macabee, Los Gatos, Cal.**

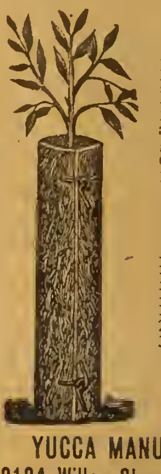


THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—30 cents per foot and prepay the freight.

Driver, Abet & Co., San Leandro, Cal.

THE "BOSS"
TREE PROTECTOR
Made of Yucca Palm



Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. Can be easily removed; will last for years.

Send for samples.

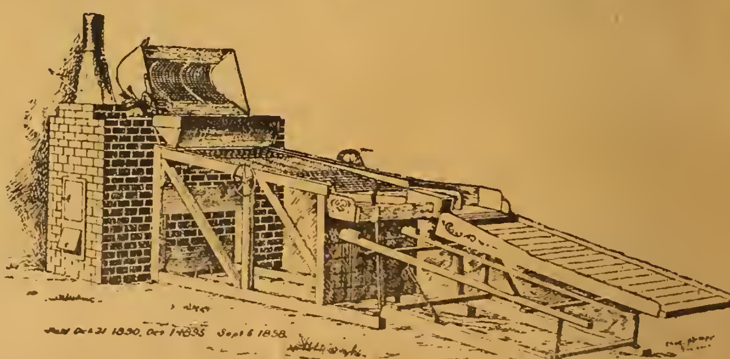
The Economical Way is the Anderson Way



Combined Dipper, Perforator, Grader and Spreader

The Anderson Process is the result of the most careful study and experiment during a number of years, and combines all the desirable qualities of the older methods with none of their objectionable features. The results obtained with it are a radical improvement over the other method, as the fruit cures more quickly and evenly, and with uniform color of both skin and flesh, the former being glossy black, while the fiber is of fine amber, and with all the keeping qualities of the best lye-dipped Prunes.

The How and What Way and Why of our process will be given upon application. WRITE US.

Practical Farm Science

HONEY AND FOUL BROOD.

Elmer Todd, in the Bee-Keepers' Review, claims that it is safe to extract honey that is above a queen-excluder over a colony that has foul brood. While it is doubtless true that a large proportion of the honey in a diseased hive is not affected, I do not think it would be safe to depend on any of it being incapable of conveying the disease. A great deal of the honey stored in the super has first been stored in the broodcombs, in many cases at least. Indeed, I believe Doolittle claims that most of it has been so stored. If this is the case, it will be seen that any honey in the hive is liable to be infected, no matter how clean the combs in which it is finally stored. I am sorry to see such things published, because most people are entirely too ready to take chances with foul brood, and I wish I could impress it on their minds that it does not pay. There are some methods of dealing with foul brood that work all right in the hands of the expert and careful, but which leave altogether too many chances of spreading the disease when attempted by the average bee-keeper.—A. R. H.

NO SUCH ART.

At the meeting of the National Bee-Keepers' Association, held in St. Louis, a good deal of time was occupied in discussing how to overcome the widespread but erroneous notion that comb honey is manufactured by machinery. It is astonishing how even a false statement is relished by the people when seen in print.

Anything for a sensation, even if it must be denied the next day. And there are so many marvelous things coming to pass it is little wonder that people can't separate truth from error. No one who has ever had any practical experience with bees believes it possible to imitate the perfect comb by machinery. All bee-keepers laugh at the credulity of people who believe it.

REARING QUEENS.

Rearing queens is a very important part of apiculture. If we expect the greatest honey yield per colony, we must look well to the queens, as they are the life of the colony.

In rearing queens we must understand that the mother queen lays two kinds of eggs, namely, a fertilized egg and an unfertilized egg. The former hatches worker bees and the latter drone bees—worker cells and drone cells. The worker eggs are deposited in the worker cells, while the drone eggs are deposited in the drone cells.

By this we know what we are doing. We must not get confused by this wonderful freak of the little insect we call the honey bee.

I said the queen laid two kinds of eggs, and more wonderful still, three kinds of bees are reared from two kinds of eggs, namely, queens, workers and drones. Knowing this, we are ready to set about raising queens. Queens are raised from worker eggs or larvae by a special feeding process practiced by the bees. The feed, called in the bee world "royal jelly," is in reality pollen and honey predigested and fed in excessive quantities to the larvae intended to make the queens.

To raise queens I select a hive of bees that is in good condition as to strong stock of bees and good honey supply. I remove the queen say today. If she is a good one she is introduced into some colony where she is needed; if a bad one, she is killed. I allow this colony to remain queenless with all their brood for one, two or three days, or a sufficient length of time for the bees to begin to build queen cells on their brood. At this stage I remove all the brood leaving nothing except honey and pollen. The bees are allowed to remain thus for about twenty-four hours. By this time they realize that something terrible has befallen them, and to remedy it they know not how and would give their lives for eggs on which to start a queen. They are now in the proper condition to build queen cells, and don't you doubt it.

Having thus prepared my colony to raise queens. I go to my breeding hive and get some larvae just hatched. I cut the comb in long narrow strips, just one cell deep. I do not mutilate this one row of cells at all. To prevent mutilation, I use a sharp knife, heated in hot water, so that it will slip through the wax. I take an empty frame and attach these strips to the top bar with melted beeswax so that the cells will hang downward. I place strips thus on two frames from end to end and insert them in my prepared colony at the center of the brood nest. My part of the work being done for the present, I put on the cover of the hive and go at something else—the bees will do the rest.

Some two or three days later I go and peep into the hive to see what has been done. I usually find from fifty to a hundred queen cells started, and they would all hatch queens, but here is a trouble that I must remedy. I find that the bees were so queen hungry that they started a queen cell on all the cells inserted, or nearly so. The trouble is, the cells are too close together, and would only have a single partition between the young queens, and as the cells have to be removed to nuclei or elsewhere on the eleventh day from the time the cells were inserted, we must space these cells so that each cell will be built separately or in tubular form with its own walls all around. I take a small blade knife, warmed in hot water and destroy every other one or enough to space them properly, by cutting them out and destroying the larvae, I still have from twenty to sixty cells left for the bees to complete.

I have tried all kinds of methods to raise queens as advised by the bee world, and find this method far superior to anything I ever tried, both for simplicity and economy of time, and the best feature to me is far better results in every way. Should any of our bee friends try this method, remember by all means not to mutilate the cells given by cutting them down half way or just above the larvae, as the bees do not like it and will destroy fifty or seventy-five per cent. of the cells thus mutilated, as they nearly always remove the contents of the mutilated cells, in order to repair the damage done to the cell.

Allow me to tarry long enough to say for the sake of the new beginner in apiculture that the queen rearing should never be attempted except during a honey flow, the best time being at the beginning of a flow. At other times queens can be raised, however, but never so well as when there is plenty of honey to gather.—T. P. R.

UNRIPE HONEY.

It is interesting and encouraging to note the attitude that is being taken in regard to the extracting of honey before it is properly ripened. The great injury that has been done to the honey market by placing upon it an inferior article is apparently recognized as it never was before. It used to be taken quite as a matter of course that comb need not have more than about a third of its surface sealed when extracted. Nowadays it is pretty well agreed that it is better for the honey to remain on the hive for several weeks; and if it is all capped over so much the better. The question, "What proportion of a comb should be sealed before it is extracted?" always sounded to me very much like asking, "How much poor honey can you add to good honey without spoiling it?" Why not leave the honey in the hive until it is ripe. and have it all good? Of course, under some circumstances unsealed honey may be ripe; but usually a part, at least, of the unsealed honey is very poor stuff; and the man who puts honey on the market containing much of this is not only foolish but often wickedly dishonest.

Irrigation and Pumping

POINTERS ON IRRIGATION.

"Water is king. Here is its kingdom." These familiar words were used for two or three years by a paper published in the great Imperial Valley. Since the words "here is its kingdom" have become too literally true, they are no longer kept before the public eye.

However water is king, not only in the Imperial Valley, but over much of Southern California, and other portions of the great West. To realize that some agent or element has wrought a marvelous transformation, we have only to remind ourselves that less than a century ago what now constitutes possibly the most valuable acreage property used for productive purposes in this country of incomparable wealth, was used by the Spanish and French sheep herders as grazing grounds for their flocks.

The development of water for these lands has made it possible to grow the magnificent citrus groves, the crops from some of which have, in the year 1906, sold for $1000 per acre—not the grove, remember, but one crop of fruit. Of course these are extreme cases, and do not properly represent the citrus business as a whole, but let us know what is possible under the most favorable conditions.

Without water the lands which constitute the citrus belt in Southern California would still be of comparatively little value. Intensive farming, the production of early fruits and vegetables, which always command good prices, will be done more and more upon irrigated lands. But this company is probably the most interested in the intelligent and economical use of water that we stockholders in the Temescal Water Company pay our money for.

Here I wish to say that soil conditions vary so greatly in different parts of our colony, changing seasons make so much difference in the same soil, that no specific rules for applying the water to the soil can be safely given. Of course the object to be attained is that each tree in the orchard gets sufficient moisture to keep it in a vigorous, healthy state, so that its productive power shall constantly be at the maximum.

There are two conditions of soil which may prevent a satisfactory irrigation; either it may be so hard as to prevent the water from penetrating to a sufficient depth to keep the tree in a vigorous condition, in which case of course a large per cent of the water runs off the land and is wasted; or it may be so porous and loose as to make it difficult to get the water down to the lower trees in sufficient quantities for a thorough soaking before the water moves on to the next grove, for with us we must irrigate while we have the water, not being able to keep it as long as we sometime may need it. In the latter case we may have had no waste water worth mentioning, and yet be very far from having a satisfactory irrigation, because some trees are thoroughly soaked while others have had little or no water.

Where one has a large orchard and can keep the water two or three weeks a very marked advantage is gained over an isolated ten acres which has the water two days in thirty or thirty-five, as the case may be. And by the way, we have abundant reason for thankfulness here in Corona, that the water gets around as promptly as it does in these later days. Seven years ago this summer we irrigated with 15 inch head once in 50 days, and our assessments were just as high then as now.

Now for the practical work. We will suppose that we have ten acres of grove and a 30-inch head of water for 48 hours with which to irrigate it. We want the land well furrowed; if possible, make the furrows so that when the water is turned in at the flume it will follow the furrow to the bottom of the orchard without turning to the right or left. Of course the number of furrows varies greatly with soil conditions. The least number I have seen used was two to the row; the greatest eleven to each space. Usually we have from three to six. I like to have as many furrows as I can get thoroughly soaked, starting the water in all at the beginning and letting it run in all continuously. After five years of experience I believe thoroughly in the zigzig furrow, which crosses the space lying between the trees that cannot be reached by the ordinary method of straight furrowing.

Theory and experience agree that a tree will have more vigor and productive power by making use of the patch of ground about 10 by 15 feet, which in our larger lemon groves would lie dormant during the later summer and falls months unless irrigated. We want our furrows opened to the flume, which must be thoroughly cleaned, with gates and stops regulated before the water is turned in.

In securing a good irrigation much depends upon getting a good start; thus we emphasize having everything in readiness. Where enough water for six or eight acres goes rushing down one furrow, possibly getting clear across the grove before it can be regulated, it silts the furrows over so that during the entire irrigation it would not take more than half the amount of water that it otherwise would, and of course does not penetrate as deeply as it should. The ideal way is to have a gate in the flume to open for each furrow. But alas, when there is much trash in the water it is necessary to have the gates open more widely in order to prevent their constant clogging, so we must run two or three furrows from one spout. This necessitates very constant watching to keep the furrows running evenly, as a very small object, such as a leaf blowing in and drifting down to the dividing point, may turn too much water from one furrow to the other.

Now having our water started in all the furrows, we want to get as even an irrigation as possible and still keep the waste water down to the minimum. Let us keep our furrows running just as even as we possibly can; go over, take notes, and regulate before noon. The first day don't trust too much to the eye; some furrows take more water than others. What we want is to have them get to the bottom of the grove, as near together as possible.

Now the question of waste water: Some think it unnecessary to have any. I do not think it pssible to get an even irrigation without having some waste water; it need not be a large amount. If two-thirds of the furrows are through the second morning it will keep you very busy during the day to keep them running and get the rest through before night. The last night all the furrows should be running through, though of course it should be a very small stream at the bottom of the grove. It is well to have a few rows at the bottom of the piece if the streams are coming through too strongly.

* * *

On our large lemon trees, I believe by heavier fertilization and having more water and getting it more frequently we could get heavier crops of fruit. From the 15th of June until the 1st of October the large lemon trees should get the water every twenty days to keep them at their highest production. During the summer six years ago we were able by reason of considerable extra water stock to irrigate between the regular irrigations, making the water come every twenty days. As a result no a leaf curled in the orchard durin the summer, and in October we picked 25,000 boxes of lemons. An abundance of water would bring on ou fall pickings earlier, make them heavier, thus greatly increasing our profits.

The development of water for th arid and semi-arid lands of the grea West is just in its infancy, an the not distant future will see portion of the great American desert supporting dense populations and wit a productive power never dreame of by the prairie states, famed th world over for their fertility.—Fran Thompson, before Corona Farmers Club.

The Salton Sea continues to ris and every week notes thousands o acres of farm lands inundated.

A1 Valencia Late Orange Trees

Owing to an unprecedented demand for Valencia Late Orange Trees during the present season, the market has been nearly exhausted, with the result that many have been unable to plant for want of good nursery trees. In the face of this situation one of our heavy contract buyers at the eleventh hour changed his order from Valencias to Navels, which put us in possession of a large block of one-year-old buds of prime quality and ready for immediate delivery. This stock is first-class in every particular and will be sold at once, as the demand for Valencias exeeeds present supply. **If you are in want of Valencia Late Orange Trees it will be to your interest to correspond with us at once in relation to this stock. First come, first served; write today.**

San Dimas Citrus Nurseries **San Dimas, Cal.**

With the Citrus Growers

ORANGE GROWING.

The orange is as staple as the apple. It is the standard dessert fruit of America. The demand for it is constant and always increasing. To meet this demand the business of orange growing has reached enormous proportions, and has become the leading industry of large sections. California and Florida are, and doubtless will remain, the two most important centers of orange production. Other States and territories, however, are becoming recognized factors in the production of this fruit. Alabama, Louisiana, Texas, and Arizona possess commercial groves which are being increased.

Entirely aside from the commercial importance of the industry and the profits offered by the business, orange growing possesses facinations making the occupation well nigh irresistable to those once subjected to its magic influence. Succeeding only in regions with climatic conditions nearly ideal for health and pleasure, with a harvest time when most other fruits and plants are in their unattractive period of rest, with the glistening dark green foliage contrasted with golden fruit, with the mild warmth of winter sunshine, with bloom of flowers and song of birds to add to the enchantment, with long periods of comparative leisure between the seasons of chief activity, with a staple product and ever growing demand, the orange grower is confronted by few vicissitudes and as many pleasures as fall to the lot of the producers of any natural product.

The business demands a high degree of skill, intelligence and professional ability of those engaged in it. There is a constant accession of new growers, seeking the rewards and health offered by the orange grove.

HARDY ORANGES.

J. L. Normand, Marksville, La., is breeding new varieties of hardy oranges. The hardy variety, Citrus trifoliata, is used as the male parent. Thus far one variety has been obtained which is considered of sufficient value to be placed on the market. This has been named "Carnegie," and is a cross with the Boone, which is a very early orange. The Carnegie averages over two inches in diameter, and is of good flavor, though not as good as really choice oranges.

CULTIVATION.

No hard and fast rule can be laid down for the cultivation of the grove, except that experience in all countries leads to the conclusion that orange trees should be treated as a cultivated crop, and be given careful thorough tillage during some part of each year.

Cultivation unquestionably stimulates root activity. It has, therefore become an accepted belief, that during the periods of dormancy of the tree, occurring in different sections at somewhat different seasons, cultivation should cease, that the natural recuperative rest of the tree may not be interfered with.

There is another reason why this period, existing chiefly in the winter, should not be disturbed, in sections subject to damage from cold. Cultivation brings the sap into flow. The more near perfectly dormant the tree is, when subjected to cold, the less the danger of injury. During the period of liability to serious cold, therefore, all working of the soil, with its stimulating effect on the roots, should be wholly abandoned.

TO PREVENT FROSTS.

Robert Nelson, in conversation with a representative of this paper a few days ago, gave a formula for protecting fruit from frost that is worthy of attention, and the experiment should be tried:

The plan is this: Place under the trees several vessels and fill them with water, then take a woolen string and fasten a rock or weight of some kind to one end of the string and tie the other end to a limb or twig up in the tree, and put the weighted end in the vessel of water.

Attach a number of these strings thus—the more the better—and the young fruit will not be injured by severe frosts. He says that ice collects on these strings very thick and can be scraped off. Mr. Nelson says he knows it will work for he has seen it tried many a time. The water or strings do not have to be removed during the day.

If the famous Luther Burbank would tell the people this, every farmer in the country would try it.—Lakeview Examiner.

It is expected that the coming state fair will be the greatest and most important ever held in California.

ORANGE SOILS.

The composition of any soil, as determined by analysis, has little bearing on methods of practical fertilizing. This must be true, from the impossibility of determining the amount of any soil constituent which may really become available, or possibly used by any crop during its period of growth. The chemical composition of the soil is now generally believed to be of less importance to the plant than the physical condition of the soil and its constituents. The composition of the soil, however, does offer some indication of its crop adaptations and general productiveness.

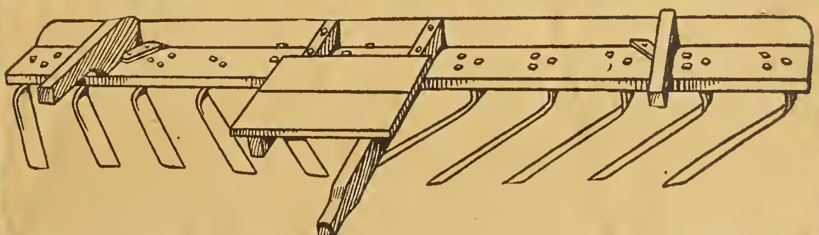
—THE—

Killefer Clean Cut Weeder



Is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. It does twice the work of any other tool with the same power. The knives overlap so it is impossible to miss any weed. Built in 6, 8, 10 and 12 foot sizes. The patented knives are so formed that they wear uniformly from heel to point, causing them to wear twice as long as any other blade for the same purpose. It is *the* tool for weed killing on any kind of cultivated land. Blades can be attached to cut in or out as desired.

The Killefer-Griffith Mfg. Co., 1336 Palmetto Street, Los Angeles, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

MOVING PALMS.

One of the most prominent tree-planters in the State writes us from Riverside to know how best to treat palms after moving. He notes that a newspaper writer advises no water for palms for several weeks after removal.

The correspondent says he has moved hundreds, watered them most abundantly from the very beginning and has lost none. Such has been the practice and experience of the writer, who has moved many palms each year, for many years and has never lost one.

To get down to the root of the matter as well as to the palm roots, let us consider where and under what circumstances our palms grow.

All species, in whatsoever clime they grow, are found where their roots may easily reach water. Even among the mountain species like Erythea Brandegei from Lower California, the plants are found growing in or near the bed of mountain streams. Down in the canyons and on the protected mesas of the desert our native fan palm grows where the roots invariably find water at easy distances. In the canyons may be found, for a large portion of the year, pools of water in basins of solid rock, into which palm roots fairly pour from every direction. Out on the desert borders the writer has seen where palms have been but recently blown over and the holes left by the uprooted trunk has very quickly filled with a brackish brine, too strong to drink.

Based on years of experience in the successful removal of large palms the writer has no hesitancy in putting forth the following as both the theory and practice attendant on success.

The time to move palms is at two different periods—one in spring before the growth has started through the stimulus of the winter's rains and the subsequent heat—the spring growth will then take place in the new position, in place of in the old. The other removal period is after the growth of spring has been exhausted and the palm has somewhat "cured up" in all its parts—has entered its annual resting period—is partially dormant.

The latter period is close about September 1st. If the palm is moved at this time and heavily watered it starts new seasonal growth then, for it has rested and there yet remains enough of warm weather to stimulate root action. When cold weather comes the palm again gets a rest for the soil temperature gets so low that root action is practically nothing. Small palms moved in the winter often decay from the unhappy combination of wet and cold. Older palms, even though all roots rot off, still have a reservoir of strength in their trunks which will manifest itself in "the glorious springtime."

The trunk of our native fan palm may be likened to a huge sponge full of water. The greater bulk is water. The writer has hewn chairs out of a section of trunk three feet in diameter and four feet long, which could easily be moved about with one hand, so light do they become when dry. Many desert ranchers place two uprights and a cross trunk to provide a rustic entrance to their ranch—a boy could almost put the hugh cross log in place. Visitors to Palm Springs may have noticed both above mentioned articles on the grounds of Dr. Wellwood Murray.

When palms are removed all water supply from the roots is cut off until new root action takes place, and to ensure success this water should be supplied the trunk—not through the roots, for their capillary powers have for the time being been destroyed—but by watering the trunk.

Six weeks ago the writer moved two fan palms in his own garden. Last night four pailfuls (large ones) were poured into the interstices at the top of each four foot trunk. Not a drop reached the ground! The trunks absorbed it all. No doubt all who have moved palms have noticed how the trunks shrink. This will not happen if treated as above outlined. The two palms noted are now putting forth their first new leaves—a wonderfully quick recovery.

Palms Growing in Water in a Desert Canyon.

The above practice is based on nearly twenty years of successful palm culture and we can assure our readers that if faithfully followed no losses will result, even though no roots are taken in the case of our native fan palm. Other species require more careful treatment, and some are extremely difficult to re-establish when once disturbed.

PALMS FOR STREETS.

Each year sees a stronger demand for the Mexican fan palm (Washingtonia robusta) for street planting. "Easterners" who reside here may cling to their foolish old sentimentalities about deciduous trees all they choose to; the fact remains that the tourist wishes to see the "land of the the banana and the palm" and we have to cater to this taste. Let us live up to our possibilities and have a tropic or semi-tropic vegetation on every hand. Every State in the Union can furnish bare branches in the winter season, why should we, when we have a climate all our own; and the same is copyrighted.

LET ROSES REST.

The chances are that you are getting no roses worth picking from your bushes and yet you are still watering them frequently and more or less thoroughly. Don't do it. If the bushes wish a rest and they are old ones, water no more until the hot weather is past. No matter if they drop their leaves; they will not die. When the weather becomes cool in the fall, cut out all small and useless wood—all that is diseased or in the way—all that sticks into the center of the bush and prevents free access of light and air. Cut back two thirds of the good canes remaining. Then water freely and often and you will have roses—roses you can conscientiously brag about. One of the most successful winter rose growers out in the Eagle Rock Valley, near Los Angeles, had no water to give his roses—not a drop reached them except from the heavens—in the long, dry summers they looked pretty tough, but the outcome was always the very finest crop of winter and spring blooms ever marketed. Try it—we have for years—it will bring the best results.

DEFINE WALKS AND BEDS.

While we do not like to see roads, walks, and beds and other divisions of the home gardens unduly accentuated, nevertheless such boundaries are often necessary in order to reduce the labor of caring for a garden. There must be something against which lawns and flowering plants may stop and go no farther. Soil under constant cultivation soon becomes higher than the enclosing paths, which are trodden down hard and consequently the water runs off and the plants suffer in consequence. If redwood boards are partly sunken in the ground to hold the water in, the labor and amount of water needed are both agreeably reduced.

THE GOOD OLD PEPPER.

During these hot days nothing about the farm home is so grateful as the "shade of the old pepper tree," and it takes but hot weather to bring out declarations of appreciation of this old time favorite. "Trees may come, and trees may go, but I go on forever." Thus sings the pepper tree, and not without justification. Truly it is the friend of all who live in the country and often is the only relief the landscape has about farm dwellings. For shade about the kitchen door, for screening the hot side of the house at noonday, for the children to play under, and eat lunch in the shade during the heated term, nothing surpasses the pepper. Plant one.

ALYSSUM.

These are pretty little plants for beds, vases, baskets, edgings or rock-work, blooming profusely all summer; useful also for winter-flowering. Very sweetly scented. Often becomes naturalized in California and runs wild.

SHADE TREES and EUCALYPTI

In the Vegetable Garden

BY ERNEST BRAUNTON

GARDEN CORN.

The soil requirements of sweet corn in California do not differ materially from those of any other State. They free, somewhat sandy loam, well enriched, will bring the best results. Three points must be borne in mind. The soil must be warm and at regular intervals the crop should be well irrigated; cultivation must be thorough and frequent.

Do not be in a hurry to plant, for if your ground is cold, or water stands on it nothing but failure will result. We are not so confined in planting season as our less fortunate neighbors on the other side of the Rockies, for corn planted in the garden at present will bring just as good crops as if planted earlier. Of course everyone wants early corn, but if corn planted in July, in ground previously irrigated, is given about three irrigations during the summer and at least as many good hoeings or cultivations, you will get first class corn.

VEGETABLE SOILS.

Many fruit growers are wasting their time and money trying to grow trees in a shallow soil overlying a strata of hard pan, with the absolute certainty of failure, more marked as the years roll by. Such soils make ideal gardens for intensive cultivation, and should by all means be given over to vegetables or grain. Some of the most successful gardeners we have in Southern California have settled, by choice, on just such lands.

POTATO DISEASE.

As the country becomes older, parasitic diseases and insects multiply. While in the great potato lands of the West the plant grows luxuriantly and is but little injured by blight or insects, even here in California, these often cause the loss of nearly one-half of what the land would produce without them.

There are several different diseases caused by different germs or fungi. These are often confused and though usually distinguished as blight, rot and scab, there are several kinds of glight, also of rot and scab; each due entirely different treatment. Just at present growers in parts of Northern California are forced to spray for a blight which seems hard, if not impossible to overcome, the spraying acting only as a preventive measure.

WATERMELONS.

Watermelons are strictly a hot weather crop, even more so than the cantaloupe, and the desert regions should provide us with the largest and sweetest. In general they like a sandy soil, but we have eaten very fine melons grown on black adobe a foot deep which had been filled over lighter soil, so that drainage conditions were good.

Planting is usually done in April and May except on the desert, but if you are in what is practically a frostless location you may plant now and get good melons for the holidays. If the late autumn proves warm the quality will be excellent. Cultivation should be kept up in field culture until the vines render further work impossible, but in the garden there is practically no limit to the time when the hoe may be used. It is advisable to cultivate melons as much as possible in order to prevent evaporation of soil moisture, for if possible they should grow without irrigation.

FOOTHILLS VS. LOWLANDS.

While the labor and water needed in the lowlands for general gardening are less than the foothill districts require, these conditions are not all "to the good" for such lands are practically unlimited in area and much colder in winter than those higher up. Along the foothills there is a longer season, beginning earlier, and lasting later. Some of these spots are practically frostless and vegetables can be put on the market at times of scarcity and the highest prices, and when the lowlands are bare.

FOR MAN OR BEAST.

Now that it is definitely known that carrots are health-giving food to all animal life, they should be found in every garden. They need not all be fed to your horse, which is very fond of them and for which they are a most excellent food, but eat plenty of them yourself. For asthmatics and those troubled with nervous ailments and diseases of the respiratory organs they are very beneficial. Upon this point all medical authorities are agreed.

In California we may grow them a larger portion of the year than falls to the lot of the "Easterner," and there is no valid excuse for being without them if you have a liking for this most excellent vegetable.

For carrots a deep and thorough preparation of the soil should be made and the crop must be kept in the best possible state from seed sowing until harvest. Unless you wish carrots tough in texture and strong in flavor you must see that they are never checked in their growth. Often a slight neglect will place them in the second grade of desirability for human food. If grown for stock of course no such care is necessary. For table use they should be crisp and mild in flavor.

PARSNIPS.

Sow the seed of parsnip as early as convenient in the spring in drills 18 inches to 3 feet apart. Thin the plants to stand 3 inches apart in rows. The parsnip requires a rich soil and frequent cultivation. The roots can be dug late in the fall and stored in cellars or pits, or allowed to remain where grown and dug as required for use. As soon as the roots begin to grow the following spring they will no longer be fit for use. All roots not used during the winter should be dug and removed from the garden, as they will produce seed the second season and become of a weedy nature. When the parsnip has been allowed to run wild the root is considered to be poisonous.

To prepare parsnip for the table, boil the roots until tender and then cut in slices and brown in butter. They may also be roasted with meat the same as potatoes.

LATE VEGETABLES.

Do not give up your home vegetable supply because the spring crops are exhausted. There yet remains plenty of time to produce the finest vegetables of many sorts. All that is needed is a little extra care and water above the amounts required for earlier plantings.

Beans, corn, potatoes, squashes, turnips, and many other table favorites may be planted during the next 30 days with the assurance of good crops of excellent quality. Lettuce and radishes will thrive in many parts of the state every month in the year and in nearly all sections for eight or ten months. Throughly wet the ground, plow as soon as possible, very deep, and cultivate and harrow until in perfect tilth. Then sow your seeds before the soil dries out at all and keep a good dust mulch at all times. When irrigation is necessary follow it closely and thoroughly with cultivation. This is more necessary in late crops than in the earlier plantings.

IRRIGATION.

Irrigation cannot now be avoided nor delayed. Except where the ground is naturally moist or damp from irrigation, the heat would finish the strawberry crop and where blackberries were far enough advanced the fruit would be apt to suffer. Everything should be irrigated during July—fruits, ornamental plants, vegetables, and field crop—in order to get the best growth of the season, which will show later on. The only exceptions to this rule are in the case of deciduous fruits that are near maturity, such as apricots and early peaches, which ought to have been irrigated sufficiently in June to carry them over until fruit is picked.

SURE SEAL,

Home canning of vegetables, meat and fruit made easy and certain by The Economy Jar

To give you an idea how easy it is to can fruits, soups, vegetables, meats, etc., in the Economy way—Note the wide mouth—how easy it is to put your hand in and thoroughly clean the jar. No rough seams inside or out to catch lint, chip into food or scratch you. After pouring the contents in hot and wiping rim of jar, clap on the gold-lacquered cap (acid-proof.) No screwing, twisting or prying. Just press the cap on gently. No bruises, burns, cuts or sprains when you use the Economy. Put clamp on top to hold cap in position while contents are cooling. The cooling forms a vacuum and holds cap on firmly. Jar is then absolutely airtight. Next day remove clamp, which lifts off lightly. If the food was cooked enough cap is held tight by vacuum, and contents cannot spoil, as no air can leak in. If cap loosens, contents were not cooked enough to sterilize, and can be heated again and saved. The Economy automatically informs you if contents are in proper condition to put away. When ready to use, puncture cap with can opener and pry off lightly. No sprained wrists, no unscrewing, no hands gashed by broken glass. No glass particles in food; no smelly top; contents fresh and sweet as the day you put them up. No separate rubber rings required. The Economy is the jar you will use with comfort and satisfaction year after year. There is absolutely no jar that looks like, works like, keeps like, seals like, or opens like the Economy. Using some other jar *cannot* give you any notion of what the Economy really is and what it really will do. Try the Economy for yourself. Ask your dealer for it. Send his name and we will send you, free, a booklet of recipes. Write direct to main office.

The True Patriot.—It is not the "spectacular" citizen who trots out his patriotism once each year, on Independence Day, that proves the mainstay of the country, either in time of dire need or in the conduct of its everyday affairs.

True patriotism in a citizen is a deep, strong, and abiding faith in and love for the country in which he lives, coupled with a determination to strive ever to keep it worthy in so far as the individual counts in the grand total.

Though we have many classes of citizens there are two that call for special mention: one, like the small boy, is overwhelmingly in evidence on all state occasions, while during the balance of the year he is unheard and unnoted except under the general title of "our fellow citizens." The other is the sterling patriot who works unceasingly and unflinchingly throughout the year for the uplift of the "masses" and the abolition of the "classes." We have too many of the former, yet all too few of the latter.

Life consists of something more serious than a little revelry on two or three great occasions each year and it is not the citizen who is in the midst of the firecrackers on July 4th who was found midst the fire and smoke of Gettysburg or Antietam. Too many parents allow their children to look forward to the coming of Independence Day as a time for making all the noise possible, entirely neglecting to instill upon their youthful minds a lesson in patriotism; often neglecting to even inform the child regarding the reason for such celebration.

We would not, though it were possible, deprive the young people of one jot or tittle of the enjoyment incident to the occasion but we cannot but feel that some restrictions should be placed on the celebrations of the unwise for the purpose of safeguarding the public in general. In California, owing to the dryness of our summers there is a larger amount of combustible material on hand than is possible in other states, and the danger is in consequence, much greater. Many municipalities have forbidden the use of firecrackers within their lines, others have reserved certain streets which must be left "bomb free." We believe the spirit which prompted these restrictions to be a good one, and if the "spirit is not manifest" in the proper manner that they will eventually be properly adjusted. We do not believe that in order to get all the fun possible out of a day, it is necessary to make all the noise possible. Such a belief harbored by a few is a legacy left us by our savage ancestors.

However, let us make the "welkin ring," in a right good, whole-hearted manner; let us perpetuate the day and the memories sacred thereto and seek to emulate our forefathers, in both spirit and action, as we believe they celebrated on that first memorable day of long ago. If we read history aright, though there was booming of cannon, and everybody was in "high spirits, it was rather a deep, joyous feeling of thanksgiving that filled each patriot's heart, at relief from burdens too great to be borne by men destined to be free. Let us approach the day in something of the same spirit, and with becoming gravity perpetuate the day, the greatest in our national history, as one to be remembered with reverence, and not to be entirely given over to frivolity.

* * *

Farmers' Institutes.—The institute season, both north and south, will commence not far from September 1. The State has been more equably divided than heretofore by adding the counties of San Luis Obispo and Kern to the southern district.

A few weeks ago we were fearful of being without a leader in either district. Rumor had it that Prof. W. T. Clarke had accepted a call to an eastern state and that J. B. Neff would run for Congress from the eighth district. It appears that Prof. Clarke has but gone east to inspect the field in which he has been offered a position as State Entomologist, with no assurance of acceptance, and the only "running" Mr. Neff contemplates is to "run" the Farmers' Institutes next year on more practical business lines than ever before.

With two such leaders as Messrs. Clarke and Neff the season opens under very promising circumstances and we may expect to see a renewed and increased interest in these great educational meets. Every year marks a deeper appreciation of these institutes, an appreciation confined to no section or state, but general throughout the country. Prof. Wickson, who superintends the work in this State has been careful to see that none but practical, experienced speakers are secured for the general lecture staff, people who have actually performed the work they are expected to talk about. He early recognized the futility of sending out speakers who were easily "called down" or "stumped" by a few practical questions. In consequence we have two staffs, one in Central California and one in the south, in which every member delights in being plied with practical questions by practical people. The outlook for the coming season is a glorious one and we confidently expect to be able to report to our readers at the end of the season, that both interest and attendance showed a marked increase over that of last year.

* * *

Forest Homesteads.—In all the forest reserves in California there are little spots containing the best agricultural lands that have been proven of no direct value to the government in the reforestation work and practically useless so long as these spots were not opened to the homeseeker.

Congress has just passed a bill which opens these fertile acres, with streams, springs, etc., to settlement by the public, on all reserves except those in the counties of Inyo, Tulare, Kern, San Luis Obispo, Santa Barbara, Ventura, Los Angeles, San Bernardino, Orange, Riverside and San Diego.

For long years our people have desired to enter upon these lands under law and make of them homestead tracts. They have long appealed to the Federal Government to list the tracts and declare them open to entry. Very many of the tracts have been occupied by settlers and upon some of them there are valuable improvements. In several districts the residents have been agitating the setting back of the reserve line from one to ten miles, because of the valuable mesa or valley lands contained therein.

This new law authorizes the Secretary of Agriculture, on application or otherwise, to examine lands in permanent or temporary reserves chiefly valuable for agricultural purposes without injury to forest reserves and not needed for public uses, and in his discretion to list the lands by metes and bounds, file the lists with the Secretary of the Interior with a request that they be opened to entry under the homestead laws.

Not more than 160 acres must be embraced in any one tract and not exceeding one mile in length. It is provided in detail how entry may be made, the posting of the lists, their advertising, etc. It is also provided that settlers who occupy in good faith any such lands prior to Jan. 1, 1906, and who have not abandoned the settlement and who are qualified to make a homestead entry shall have preference in right of settlement and entry. This provision will protect many deserving settlers who have made valuable and permanent improvements.

Each settler has five years when desiring it, to obtain a patent to any such lands, make proof of settlement, residence, cultivation, etc., and by means of a detailed formulae proceed to the end desired.

Settlers on any of these lands on January 1, 1906, who have lost their homestead privilege or have already exercised it, but are otherwise competent to enter lands under the homestead act, are granted an additional homestead right of entry for homesteading on payment of $2.50 an acre on making final proof, thus protecting the pioneer.

Of course there are a few exceptions to the general workings of the new law and no encouragement is held out to those who feel inclined to settle on lands not opened to the public, with the expectation of holding them until opened under the act, nor shall the act be construed to impair the legal rights of bona fide homestead settlers, who have established residence on public lands prior to their inclusion within a forest reserve. On the whole this enactment is of great importance to all secions of the State north of Kern and Tulare counties and will aid materially in the development of some sections now but sparsely settled and make possible the improvement of lands already in possession of the public, but useless through want of water only available by development and piping from forest reserves.

* * *

Farmers' Clubs.—We are willing, and anxious, to make a note of all meetings of Farmers' Clubs, subjects discussed and such other items as may be of general interest. A list of the questions considered by your club might furnish topics for those in other sections of the state; for lack of "something to talk about" of general interest is the rock upon which many a club has foundered. We should be pleased to have some officer or member in each Farmers' Club in the state keep us posted on all important points of their club life. Only a few days ago we received a letter from the secretary of a Farmers' Club announcing an annual picnic to be held in a large park, accompanied by a request for the names of secretary or other officer of all surrounding clubs so that an invitation might be extended to all to actively participate as guests of honor. Unfortunately we had but a few of the necessary addresses on hand. Let us hear from all.

* * *

The Farm Home.—Make the farm home attractive, inside and out. Too much attention is paid by many to the pecuniary side of farm life only. The most successful life is the happiest one, and we cannot be happy in a home where no evidences are apparent of love of the beautiful, where bare walls only are seen both indoors and out, where squalid, weather-beaten buildings rise from a dooryard of tangled weeds. We plead for both the boy and the girl. Have a few choice books, magazines and a daily paper on the table, well selected prints or reproductions of famous paintings on the walls, some of the better class of trees, shrubs, and plants in the yard, with order everywhere apparent. Such things cost but little and often make the difference between a place to live and a country home, between a house of strife and discord, and a happy family.

FARMERS CLUBS.

The Gardena Farmers Club will hold its annual picnic in Eastlake Park, Los Angeles, August 2nd, and all members of clubs who can attend are urged to call and participate for all will be made welcome.

The next meeting of the Covina Farmers Club will be held at the residence of the president, B. F. Thorne. Subject "Trees and Shrubs." Ernest Braunton of the Cultivator staff will be one of the speakers. Ellen Beach Yaw is spending the summer with her sister, Mrs. Thorpe, and it is expected this talented singer may be prevailed upon to render a song for the entertainment of the club.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Marysville is having a new cannery built.

Vacaville is installing a Cyclone Car Cooler.

Beets about Salinas were all planted by the 20th.

The grape crop in the Chino Valley will be light.

Winter Nelis pears are a failure in the Carmel Valley.

The Los Gatos fruit canneries employ over 400 hands.

El Dorado County now has a Horticultural Commission.

Thermal shipped Thompson's seedless grapes last week.

Yuba City reports a bran new cannery very near completion.

The walnut crop of La Habra will be the largest in many years.

Ontario wants women and girls for the local fruit packing houses.

Redlands reports that apricots are the best in quality ever grown there.

Huntington Beach has a huge canning factory under process of erection.

Southern California will have about 80 cars of apricots as against 300 last year.

Riverside orange growers say the "hot spell" was just what they needed.

All the Valencias from the Porterville-Lindsay-Exeter district have shipped.

Deciduous fruit shipments are 300 cars behind the record of last year, up to date.

Apricots are still going up in price, selling for $40 per ton and 13 cents when dried.

Napa will have a new cannery open about July 15th which will employ 500 persons.

It is estimated that most fruit crops will bring 50 per cent better prices than last year.

The Tulare County citrus fair will be held in Porterville the last week in November.

Peaches and plums from Sonoma country are sent down to Los Angeles every day.

Beaumont has picked about 50 tons of cherries and will have about 500 tons of apples.

Lemons, berries and many fruits and plants were damaged by the hot spell of a week ago.

Geyserville is building a winery a hundred feet square, with a capacity of 100,000 gallons.

The walnut crop in the country below Pasadena will be but 50 per cent of last year's yield.

One warehouse in Fillmore has sent away a car of fruit each day for more than six weeks.

On June 6th the supervisors of Lake County appointed a Board of Horticultural Commissioners.

The Highland Home ranch east of San Bernardino will pick 160 tons of peaches and 40 tons of cots.

San Bernardino County has a touch of pear blight, which is being stamped out by extremely vigorous measures.

At Fresno dried peaches are bringing 10 cents and apricots 15 cents, with chances good for a further rise.

All of Redlands Valencias have been shipped, in all about 600 boxes short of the number shipped last year.

A 3-year-old child at Redding found toadstools in the back yard last week and died within a few hours of eating them.

Lodi reports an unusually heavy apple crop at splendid prices, most of the fruit being sold already on the trees.

The San Jacinto apricot crop is a good one this year, the quality being way above that of the past several years.

The Los Gatos canneries never stop from Monday morning to Saturday evening. having both night and day crews.

San Jacinto's apricots, which are good in both yield and quality, have just begun to ripen. The cannery opened on Monday.

Grape fruit sold in New York last week at $11.25 per box, the highest price ever known. It was grown at Highgrove, near Riverside.

AGRICULTURE.

Glendora has a fine poptato crop.

Exeter will have a heavy cantaloupe crop.

Glenn reports a banner year for potatoes.

Prices of beets at Alamitos average $5.65 per ton.

The wheat crop about Lockwood will be a record breaker.

Thermal is harvesting the fourth crop of alfalfa this year.

The northern watermelon crop is said to be ruined by rains.

The Salinas Valley will have the best crops ever known there.

The Submarine reports that aphis are on the wane about Coachella.

The Visalia sugar beet plant will begin operations about July 15th.

Both old and new hay are bringing good prices all over the state.

Beaumont reports a crop of 37,000 tons of hay and 35,000 sacks of grain.

The Hessian fly is damaging wheat in San Benito County quite seriously.

The barley acreage in California is about 8 per cent greater than last year.

The Alamitos sugar factory is shipping 26,000 gallons of molasses per week.

San Jacinto has suffered from several grain-field fires during the past ten days.

Insects are damaging the bean crop about Oxnard, but beets are in fine condition.

Los Alamitos district will have by far the biggest beet crop ever harvested there.

A Monrovia rancher died on Monday from the effects of fighting fire in his fields.

The Imperial country wants a county all for itself, with Imperial for county seat.

A serious loss occurred near Tipton a few days ago from the burning of grain fields.

Floods from the San Joaquin have flooded thousands of valuable acres about Stockton.

Redlands reports a heavy crop of hay and grain, the barley crop being unusually large.

Last Sunday a fire destroyed a considerable acreage of fine barley near San Bernardino.

Tulare County will start a carload exhibit of her products eastward today (June 28th).

More than 1,00 acres of barley near Rialto was destroyed by fire the fore part of the week.

All sections of the state report a "hot Monday" that will go down in history as a 'sizzler.' '

The 1906 crop of tobacco in Mexico is estimated at 25,000,000 pounds, but it is said to be poor.

Wildomar had none of the late rains and all their unusually heavy hay crop belongs to class 1.

Wildomar reports that $15 f. o. b. Los Angeles has been offered for all the hay in that section.

A Los Angeles syndicate will colonize the Kraft ranch of 9000 acres in Tehama and Glenn counties.

Thirty-five hundred tons of hay and 1000 sacks of grain burned on a wharf at San Francisco last Monday.

Blanco potato growers are buying machines to spray their potatoes to kill the blight, which is very bad.

Headers are being used this year more than for many seasons past on account of the large acreage of fallen grain.

Owing to disastrous fires about the outskirts of the city San Bernardino has appointed two "official stubble burners."

Melons, tomatoes, and grapes are expected to fill ten to fifteen cars a day at Coachella for some days in the future.

Nine cars of cantaloupes left Coachella in one day last week, but the present week is expected to be a record breaker.

Marysville reports a very heavy cucumber crop—the largest in years—and heavy shipments are now being made to remote points.

W. L. Vail, the Los Angeles cattle man, bought a ranch of grazing land near Murrietta a few days ago, consisting of 45,000 acres.

Lake Tulare is higher than ever known, having passed the high water mark of 22 years ago (1884) several days ago. It has covered hundreds of acres planted to grain fields and orchards.

Prof. W. T. Clarke, assistant to Prof. Wickson in institute work, has received a fine offer from Alabama and has gone there to look over the field before he decides the matter.

A break in the levee along Kings river on Saturday has flooded the country about Lemoore and Grangeville and destroyed hundreds of thousands of dollars worth of field crops and orchards.

LIVE STOCK.

Santa Rosa is building a new creamery.

Eggs are selling for 22 cents at Santa Rosa.

Escondido shipped over a ton of live chickens last week.

Petaluma shipped a schooner load of hogs to Honolulu last week.

Saticoy, though a small town, shipped several carloads of mutton last week.

Fifty thousand eastern brook trout were planted in the Middle Tule last week.

A gang of chicken thieves are operating in the Two Rock Valley, near Petaluma.

Honey prices will go higher in the near future as the old crop is going and the new will be both light and late.

Cattle owners about Folsom will be four weeks late in getting to the mountain ranges, on account of heavy snows.

San Luis Obispo wants quite a number of work horses and the supply in all parts of the state seems to be short.

During the week ending June 16th Charles D. Pierce sold to various parties nine registered Holstein-Friesian bulls.

Ventura county ranchers are offered but 2½ and 3 cents for their best beef cattle and are casting about for a better means of getting rid of their surplus.

Stockton is only able to handle about 200 bales of wool daily and in consequence 35,000 bales are on hand and it is expected that it will take to January 1st to get rid of it.

A. R. Coulson has disposed of his stock in the Coulson Co. at Petaluma to J. T. Wilson, a capitalist of San Francisco. Mr. Coulson will go east and enter business there in a few weeks.

Two hundred thousand trout fry have been planted in the creeks about Watsonville, and before the season ends it is expected that one million will be placed in the various streams of the county.

J. F. Miller has sold to W. H. Brezee of Modesto two registered Holstein-Friesian cows, Armona Lonnie and Dolly Alma Strother. also the bull Escalon de Kol to L. P. Jacobson of Modesto.

FOR SALE—MY ENTIRE FLOCK OF beautiful Andalusians, on account of ill health. Mrs. J. S. Duff, 3145 Hoover St., Los Angeles. Cal.

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

THE SORGHUMS.

The sorghums are divided into three classes. that readily cross with each other, so that it is not uncommon to see some new variety advertised for a year and then disappear from the market, as it has merely reverted to one or the other parent and is no better than the older form. This also shows us that these accidental crosses if left alone perish, while if in the hands of a breeder they continue to improve by the careful selection of only the best and by the addition of new blood whenever is is necessary to strengthen some desirable quality in the plant.

For ordinary purposes the sorghums are divided into three classes. The Saccharine or sweet sorghums and the non-Saccharines and the Broom corns. While the Saccharine sorghums are the ones we have been taking up in the last paper a few words in passing about the other forms may not be out of order.

The non-Saccharine sorghums are divided into two leading forms. The Kaffir as red, white and black Kaffir and the large African millet often called white milo maize. The second form is the Dhoura family, in it are the brow Dhours, Jerusalem and Egyptian corn, branching Dhoura or sorghum, and the yellow maize. There are other names for some seed men's varieties that it would be impossible to place properly, except one grew them and compared them with the true type. The broom corns are well known and their use for brushes and brooms, while they are almost juiceless and tasteless yet they are only variations cultivated by man, and by long cultivation their character intensified.

In California, the Amber sorghums (brought here from Indiana, but originally introduced there from China,) is the common one planted by the farmers. It is very hardy and prolific, stands hardship well. I have now started to plant seed from a single head of a variety sent me from South Africa, called there Koomba. The seed is heavier than ordinary Egyptian corn and the head I have is very full. It is said to be a superior forage plant producing large abundant broad leaves, with a slender stem and a small rooting system.

The difficulty of producing a crop of sorghum seed in California is greater than in the East, here the birds take it nearly all. I have to cover the heads with cheese cloth that are selected to produce seed or they are shelled out before mature.

The orange sorghum is the heaviest grain producer of any of the varieties we have grown here at the ranch. This variety is also sold under the trade name of Nuazana. The other varieties that we know to be good producers in the San Joaquin valley are the Late Orange, Kansas Orange. Colman, Colliers and the Perennial Orange. this will often live over several winters if they are not unreasonably cold and frosty.

While sorghum requires more moisture than Egyptian corn it produces more feed to the acre, and can be used as a smother crop Now how successful this would be in California I do not know. Yet in parts of the United States I am told that if land is plowed that is foul with Bermuda grass and then raked and the Bermuda burned, the land then sown to sorghum and cultivated, the next fall again plowed and raked over and again sown to a crop of hay, and this repeated for two or three years the Bermuda is smothered out, for as far as we have been able to discover the Bermuda grass has only two enemies that is shading and lack of moisture. In California by turning it up to the summer sun in plow row will burn it out, but it also makes an unsightly field and injures the land by burning up the soil fertility.

I hope to be able next winter to begin a series of experiments looking toward the destroying of Bermuda grass. I will begin this summer by oiling with crude oil all the spots on the ditch banks that are furnishing seed beds, the persistent use of crude oil will end these place and I believe that there must be some way of ending Bermuda or it will end by being the only covering of the fields in California irrigated lands.

The greatest objection to sorghum is the fear of poisoning the cattle. The commonest form of trouble is merely bloating, this comes from over-feeding of any succulent food, either sorghum, green corn or alfalfa, by taking precaution it can usually be avoided. The ooher form of sorghum poisoning is rarer yet it is deadly and fearful when it does come. The plant at times, like the laurel, secretes poison in the form of prussic acid. This poison is so deadly that the Governments of the world are agreed that only the most limited quantities are allowed to be sold by the chemists and only of the weakest strength. If in full strength a drop on the head of a cat will instantly kill it. So it is no wonder that cows eating of the young green leaves where it mostly congregates, are dead before any help can reach them. The remedies used in the cases that are not instantly fatal are molasses, flour gruel, milk, melted lard, butter, cottonseed oil or any other bland oil or a couple of gallons of milk. The animals should be out of doors and have plenty of fresh air for the breathing is labored. Now how shall we know when this poison is likely to be produced? I wish I could tell you but I cannot; it seems to be a bit of malice in the plant that there is no reason for except original sin. It was thought that ill-grown, stunted, frosted or drought stricken sorghum was the cause, but later investigation show that none of these are causes, while there have been instances where the crop was nearly perfect that the "red flag" of death came forth to slay the innocent cattle. Ill grown food stuffs of any sort are often causes that make cattle ill, with gastric disorders, these are productive of loose bowels and straining, the best remedy for this is a pound of glauber salts with an ounce of ginger given as a drench. This to be followed with a dose of olive oil, say a pint in twelve hours after the physic.

The grain from the sorghums are of particular value in the poultry yard as Mrs. Basley has so often told you, pigs all like them, and we have often fed them to both horses and cows.

Buying a Cream Separator
A little thought before buying a cream separator will save you a lot of hard work later on. Don't be talked into buying a machine with a high milk supply can—it's like pitching hay to pour milk into one. Besides it does n't cost any more to get an easy running

U.S. Cream Separator
with a low milk tank that a child can reach, a simple bowl that's easily washed, and a set of entirely enclosed gears, protected from dirt and danger. The U. S. holds the World's Record for clean skimming—it is the most profitable machine for you to buy, and will last a life time. Our handsome new catalogue describes in detail the operation and construction of the United States Separator. Many fine and accurate illustrations aid in making perfectly clear to you the advantages the U. S. has over all others. If you're keeping cows for profit, ask for our catalogue No. 20. It points the way to the biggest profits.

Editor Cultivator: Will rusty oat hay have a bad effect if fed to horses? If so what effect will it have?—J. W., Downey.

While I do not know of any actual diseases arising from the use of rusted hay, and this year the horses will have to eat it in nearly every part of the State, I do not think they do as well or keep in as good order as on clean hay. They certainly waste it badly, so that it is not good to feed it without some grain; the stock that is not hard worked will probably be able to do with but little grain.

* * *

Dear Madam: Your article in the last Cultivator was especially interesting to me from the fact that we are just considering the purchase of a milk separator and are undecided as to the kind to get. We are much pleased with the catalog appearance and description of the Sharples but have never seen one and would like the opinion of one who has used them. We only want a small one and have wondered if they are as effective skimmers as the larger ones. We read your articles with much profit and pleasure and feel that your opinion would have much weight.

If you have had dealing with the Joshua Hendy Mch. Works of San Francisco do you consider them strictly reliable.

If you cannot recommend this machine, what small machine do you consider most satisfactory?—T. L. F., Charter Oak.

Yes, the Sharples is all right, and we can only again refer you to our article as to the best way to bargain for a separator. As to Hendy's, the late head partner was an esteemed friend of ours.

* * *

Cultivator's Dairy Editor: I want to get started in the dairy business, and I come to headquarters for information and advice. Beginners have a lot to learn, and I want to get started right. I own 320 acres in the Imperial Valley W 1-2 Sec. 31, 16-16, eight miles southeast of Holtville, under the Holt Canal; the soil is a sandy loam, perfectly adapted to alfalfa growing. I have 160 acres in alfalfa, and am now cutting 1 3-4 tons per acre from alfalfa just one year old. The foundation of my plant or factory, as the "Fat of the Land" man calls it, is all right, I am sure. I know of your success in the dairy business from favorable mentions in the press, and I also remember reading that you attended a Farmers' Institute held at Imperial about one year ago. I would esteem it a great favor if you have the time and inclination to do so—to tell me how to get started in right lines. My plan is to have cows, pigs and poultry, with bees to fertilize the alfalfa for seed, and later on I may have 10 or 20 acres of Malaga or Muscat grapes. In selecting a dairy herd, what breed would you recommend, and what particular strain of that breed? How many cows would you advise to start with, what age should be selected, and could I secure the services of an expert to select what I should have to start with? Have you some good good stock that you would sell? If so what does it consist of? About what price should I pay for good stock? How many cows can one man take care of? What wages do you pay? Do you find this kind of help always available? How do you manage your help, have a foreman, I judge, to look after each department? What will your herd average, per cow, per month, in butterfat, if it should be sold at prevailing market prices? What kind of a ration should I feed to cows in connection with alfalfa hay? and in about what proportion? Do you graze your alfalfa or feed hay? If you graze what feed do you use in connection with alfalfa pasture and in what quantity? Do you consider it economy, and the preservation of alfalfa to feed hay instead of pasturing? About how many more cows will 80 acres of alfalfa feed, cut to hay, as against pasturing the same land? My place is about 8 miles from Holtville, and Holtville is about 9 or 10 miles from El Centro by rail. Could I manage to deliver cream once each day by wagon at Holtville, and then forward to El Centro? I should be glad of any information of advice, not covered by the questions I have propounded.—J. A. W., Redlands.

The "Fat of the Land" man farmed with money after the fashion of Thos. Lawson near Boston, and I do not see that either of them had more than the fun of it as a return. They certainly had the ideal life, life in the country with money to help out Nature's schemes. Think of it! Ye Gods, what could not one do, with cattle, horses, trees, flowers, if the bank never sent you those nasty little notes, saying "Your account is over-drawn."

Now, you give me no idea how much you desire to spend, perhaps I should say invest, but I fear it will be spend if you do not intend to personally superintend your own herd. I sold my large herd when my health gave out for I could not hire the work done without constant supervision. The breeding of fancy butter cows must be done under some one that studies and love the breed enough to study out the qualities of the various strains, breeding out the weaknesses while increasing the production. If this double building up is not carried out and the cows merely pushed for production, the herd weakens and the cows cease to produce off-spring and the herd perishes. If you buy grade cows select by the use of the Babcock test. Then breed to the race of dairy cows you like best. There is no best breed of cows for no one could say with what breed you would succees best. I would say select the breed you believe you wish and write the secretary of the Association asking for information as to breeders, then go to them and talk to them about their cattle.

One milker in California handles thirty cows and does nothing else except feed them. Cows that are milked three time a day count for three ordinary animals. The wages of a milker vary from $30 to $50 a month according to the responsibility placed upon the man.

One foreman manages the ranch and a head milker looks directly after the cows, and reports to the foreman as to his men. If he is dissatisfied with any of them the foreman does the discharging and hiring, while the head milker sees and is responsible that the work is well and carefully done. Indian corn is the natural balance to alfalfa. We graze the older alfalfa, but the young fields are used for soiling and hay making. As to the damage the grazing of the cattle does to an alfalfa field, that depends more on the nature of the soil than anything else. When soiling cattle on green alfalfa considerable care is needed to keep them from bloating, but it is not hard to do, if attention is paid to not over feeding them at any time, and to begin by

only allowing a small quantity at first. There is no difficulty in delivering cream that distance, we have often for months at a time, sent cream to Los Angeles from here.

Indeed the southland would fare badly for cream and butter when over-run with Eastern tourists if the San Joaquin had not cream to spare. Now, my advice to you is if you have not a working knowledge of cows to study this summer at the University in the classes of Prof. Major and Ward and some of the others, particularly learn to score cows, and also the general principles of the animal industry. You cannot hire brains, the man that has them is too busy working for himself. It does not matter what your life calling may be, it is well to brush up your own grey matter. The mind is broadened and enriched by a study of the wonderful laws of life, that unfold themselves when the study of the domestic animal is taken up in a scientific spirt.

* * *

THE SAME OLD TEETH.

Mrs. Minna E. Sherman,
Fresno, Calif.

Dear Madam:

Fearing that postcard of inquiry I sent to the Cultivator office has not reached you. I ask you direct. I recently bought an old registered Jersey cow and find she has but three incisors which are on the sides of her jaw. Could I get false teeth for her or should I pull the remaining teeth. She is very poor.

Please answer through Cultivator.

Your respectfully, H. W. McK.

If the teeth are sore to the touch remove them, if not leave them alone, it is natural for cows to shed their teeth early. Feed the cow well on soft mashes and green stuff. It is difficult to make an old cow fat; without there is some very special reason it is not wise to buy one for family use as she is failing and about the time she is used to her home and milker, may be expected to become worthless. As long as the cow chews the cud there is nothing very wrong and it is the loss of the cud that the dairyman regards as serious. I think this covers the case sufficiently. M. E. S.

THE COST OF HORSES.

The New Hampshire Experiment Station has been keeping an account of the cost of feeding a horse that weighed 1200 pounds for a year, he being kept at moderately hard work, and finds that it costs $74.32. In round numbers, then it costs $150 a year to feed a pair of such horses, and the cost of shoeing would be about $15 more, while repairs to harness and keeping them cleaned and oiled would make another $10.

Then the ordinary farmer will not make such a pair of horses last more than ten years and many would use them up in half that time. Say that they cost $300, which is not a fancy price, and yet it does not mean a cheap pair that can do a fair day's work.

SHORTHORN RECORDS.

The American Shorthorn Breeders' Association is sending out blanks to all breeders of registered stock, for entry in the record of cows in appendix of the American Shorthorn Herd Book.

The rules of entry are:

1. Cows producing 8000 pounds or more of milk in one year will be eligible to entry in the Appendix.
2. The milking performance of a cow must be verified by the affidavit of the owner.
3. A cow cannot be entered in the Appendix unless her pedigree has been recorded.

All interested should address John W. Groves, Secretary, Union Stock Yards, Chicago, Ill.

No one can tell to a certainty, by the combination o f blood lines in the pedigree of any animal, says S. W. Parlin, whether that animal possesses the abliity to trot fast or not. That fact can only be determined by training the animal. The mysterious influence of what is called atavism, or throwing back, is such that if any one of the ancestors of an animal, within several generations, was lacking in speed abilitv. the animal may throw back to that ancestor, and inherit the same quality. The same is true of the animal with a fast record, hence disappointments have occurred in the past and are likely to occur in the future even when mares with fast records are mated with stallions that have taken fast records.

A WONDERFUL REMEDY FOR HEAVES.

Horses are more valuable today than they have been for a number of years. Persons owning horses that are troubled with heaves or cough should certainly be interested in learning of the Prussian Heave Powders, which are manufactured and guaranteed by the Prussian Remedy Co. of St. Paul, Minn. They have the exclusive right for the sale and manufacture of these powders in this country and sell them under an absolute guarantee to give satisfaction. This company has sold goods for over 20 years in this country, and today have a large trade in every State in the Union. We recommend any one having a horse troubled with heaves or cough to write to the Prussian Remedy Co. Price of the Heave Powders by mail 60c, at dealers 50c.

Butter, when put upon the market, contains in addition to the butterfat, salt, a varying per cent of water retained from the washing and some casein. This is the reason why it is usually figured that one hundred pounds of butterfat will make 110 to 115 pounds of butter. This will serve to explain the difference between butter and butterfat.

If you want to drive an old plug, keep tapping your horse with the whip.

The demand for good horses is far greater than the supply.

Too much corn is the ruination of many a breeding cow

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

TOPICS OF INTEREST TO POULTRY RAISERS.

In this week's mail I find a very kind and appreciative letter from one of our subscribers (Mr. A. D. C.) asking me to write on the subject of operating incubators. Regretfully, I have to refuse her request, because this is the time of the year when we are cleaning up our incubators and closing them for the summer, and here let me say, do be persuaded to clean them out thoroughly, and then if you fear, or if you even suspect there may be moth millers or any insect likely to invade your incubator, put inside it. on the upper tray, a saucer full of of sulphide bi-carbon. The gas from this is heavy, it falls instead of rising, and it is death to insect life. Shut the door and leave the saucer inside.

Incidentally you will find this an excellent remedy for moths in furs or flannels; simply put a saucerful of sulphide bi-carbon in the top of the trunk and by the next morning every moth will be dead. If weevils get into the chicken feed, or grain bins or beans treat them in the same way, putting a saucerful or more in the top of the bin, it will kill the weevils but will not injure the fertility of the beans or grain. Of course the bin must be tight or the fumes will escape, without doing the work thoroughly. Be careful in handling the sulphide as it is quite as explosive as gasoline. Do not go near it with a lamp.

Yes! we are putting away our incubators; some of us have had good hatches and some bad, and some intend, and wisely, to increase their out-put.

It will pay anyone to prearrange for their early hatches, by getting their incubators ready, send for the catalogues of the various makers, study them thoroughly; go round to the neighbors; find out from them which are the most successfully used in your own neighborhood, then decide upon the size you want; personally, I found the 200 to 240 size the most satisfactory and I usually advise beginners to get that size.

Then after setting them up according to directions, keep the directions on the incubator and read them each time you pass it, until you know them by heart and can say them as well as a sailor can "box the compass," backwards or forward or beginning in the middle. I tell you it pays to be thorough in anything. "Whatsoever thy hand findeth to do, do it with 'all' thy might," was my favorite motto. "Sister is misquoting scripture, mother," said one of the boys.

"That is the difference between your work and sister's, you don't even play all your might," and the fault of misquoting scripture was in that instance condoned.

Another seasonable thing to do is

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

WRITE FOR CATALOGUE 47—A BEAUTY

PETALUMA INCUBATOR CO.

San Francisco Office and Salesroom, 33 Market St.

to thoroughly clean up the brooders clean them and disinfect them, don't leave them dirty or mites, ticks, fleas will occupy them or the bacillus of tuberculosis may quickly propagate and be ready to prey upon your next season's chicks, in its insiduous way, and you will wonder why your luck has left you, and will say with many "I had such good luck last year. I don't know what is the matter, my luck seem to have changed." You are right, for last year you had new brooders, and you were in luck, it is true that a few of the late chicks dwindled away and died from no reason apparently; they seemed to grow smaller and ran about humped up looking like little old men, or a few may have had a little bowel trouble, and you write to the Cultivator asking for a cure for bowel trouble, and the poultry editor has replied "rice boiled in milk with a tablespoon of ground cinnamon to the pint of milk is the best cure for bowel trouble." Whilst all along it has been tuberculosis that somehow crept into the last hatch and there the germs are in the brooder awaiting for the next season to commence. How do you know that the tuberculosis germs are not in your brooder? Did you put it away clean? Did you wash it with scalding suds and put the cover out in the hot sunshine? Did you tear off and burn the old felt? Are you pre-arranging to have a run of good luck next season or are you (mis) quoting scripture and saying, "sufficient into the day is the evil," or "take no thought for the morrow."?

I always rest from hatching in July, August and September. We women need a rest then and a change of work, canning fruit and other pleasant household duties, so that it is a real rest to have a change of work.

But we must remember to get ready for next season's hatching, and we must fight the lice, mites, fleas, ticks harder now than ever, for this warm summer weather they breed and multiply in an astonishing manner.

I am sure some of our old subscribers will forgive me if I again give the recipe for the emulsion that I make for spraying the houses and which I also use for dipping the hens to assist the moult. I have reason also for repeating the recipe just now because in the government bulletin, given in a recent Cultivator the proportion of oil is twice as much as water and it will be found difficult, if not impossible to make it emulsify.

Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you NOW have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line ☞

Ask for particulars about our FREE TEST Plan. Write today—you can't afford to wait.

ACME MILLS CO.

PACIFIC COAST MANUFACTURERS
PORTLAND, OREGON

Take one gallon of boiling water, dissolve in it one bar of laundry soap, or one pound of soap powder, when dissolved remove from the fire and add one gallon of kerosene and one pint of crude carbolic acid. Churn violently till cold or till you want to use it. Take one quart of this, add to it ten quarts of water, warm or cold, I prefer warm; spray your houses, coops, brooders, perches, nest boxes, etc.

For dipping hens, take one quart, add to it ten quarts of warm water; immerse the hen all but the head, see that every feather is soaking wet, look for nits (putting these feathers into a small can with coal oil and burning them up, when the performance is over).

Dip the hens on a sunny morning, so that they will not take cold. This dipping makes them look horrible, but helps them shed their feathers, entirely frees them from lice, and helps the new feathers to grow. One old poultryman said it so thoroughly cleaned his hens that he could not find a louse for three months but he added "it makes them look like fury."

The feathers soon change and even if they do look bad for a month, it is a comfort to know that they are clean. If the oil separates from the water, it shows that there is not soap enough in it; add more.

Then in the summer season we have to keep the pullets growing. Do you realize that your fall and winter supply of eggs depends entirely upon the way you feed and care for your pullets now? Now! not next fall. Do you realize that a June hatched pullet by proper care will be laying by Christmas. How? Comfort, exercise. Proper food. Same old text.

Comfort now means shade, shade, shade, as well as sunshine, clean fresh water, exercise, scratching, teach your pullets to scratch; it develops and strengthens the egg-making organs.

Proper food. You cannot overfeed a growing pullet—that may seem a broad assertion, but it is true. You can feed a wrongly balanced ration, but you cannot possibly overfeed a pullet with a rightly balanced ration.

Then another seasonable suggestion is sell off the cockerels, put an add in the paper "four or five hundred cockerels, just right for caponizing" and see how gladly some of the "Caponizers" will buy them, giving you more elbow room for the pullets and lessening the feed bill. Or if you want to keep them and caponize them or hold them over, separate the sexes, they will do much better.

* * *

ANALYSIS OF WHEY.

Mrs. A. Basley,

Dear Madam: As you cannot find the analysis of whey I take the liberty to give you some information about it. First bear in mind that there are two kinds of whey, sweet whey and sour whey, and therefore you find a big difference in the figures of the enclosed analysis:

	Sour.	Sweet.
Water	93.004	94,600
Fat	0,044	0,430
Protein (nitrogenous matter)	2,267	1,228
Sugar of milk	4,304	5,852
Ash	0,233	0,817

Sweet whey results from using rennet with sweet milk, sour whey from the natural souring of milk. Sour whey contains less sugar of milk than sweet milk whey and is more poor of ash but richer in protein than sweet whey. Whey is an excellent food for hogs, as its ash has a high content of phosphoric acid of kali and of lime, which go largely to the making of bone.

I cannot tell you the value of whey for chickens, but I saw, when I put skim milk and whey outside, the hens always drank of the whey first and left the skim milk. I guess the old hen knows all right what she needs for her health. I am, very respectfully,

MARTIN KIRSTEN,
Dairyman of the Patterson Ranch Co.
Oxnard, Cal.

We are sincerely thankful to Mr. Kirsten for his analysis of the whey. It is by giving one's knowledge so kindly and freely that we can help each other. I often wish that many of our readers would respond to our invitation and tell us something that perhaps they know better than others and so "lend a helping hand."

PACIFIC COAST SHOWS.

Sacramento, Cal., Aug. 25 to Sept. 1, 1906.—California State Fair Poultry Show. Secretary, J. A. Filcher.

San Jose, Cal., Nov. 12-17, 1906.—Sixth Annual Exhibition Santa Clara Valley Poultry and Pet Stock Association. E. Van Every, Secretary Eden Vale.

CITY ADVANTAGES IN THE COUNTRY.

Gradually the advantages of the city are being secured by country residents. The telephone, electric lights, mail delivery and other improvements are adding to comforts of rural dwellers as much as to that of the city people. Gas for cooking has been more of a luxury but it now rapidly becoming a necessity. Improved machines are giving a gas at a price much lower than the cost of city gas. And for a nominal initial outlay. One of the very best of these, is that manufactured by the Speer Gas Machine Mfg. Co., of 922-4 Santa Monica ave., Los Angeles, Cal. This machine manufactures gas from gasoline which gives a light and heat superior to city gas and at a most economical price. Three gallons of gasoline will manufacture a thousand cubic feet of gas. A beautiful illustrated catalogue is issued by the company which gives full information.

PREVENTION ON DISEASE.

The rapid strides that poultry-keeping has made within the past ten years is evidenced by the enormous increase in the number of fowls now kept everywhere, with the result that there has been too much overcrowding, and consequently an increase in the spread of disease. I do not mean that the number of fowls altogether kept in the country is excessive. On the contrary we have not near enough yet. But the majority of people with limited space are disposed to keep many more than they have room for, and this overcrowding ends in disease breaking out and spreading to other places. Years ago it was a very rare thing to hear of disease among a farmer's fowls. They had plenty of air and exercise, with full liberty to go where they pleased, living nearly all their life in the open air. They may have been bad layers, especially in winter, but they had one good quality, they were very hardy. Now, however, one hears continually of diseases breaking out among poultry even in country places.

There are two reasons for this: one is that, as I stated, too many fowls are kept congregated together, and secondly they are not allowed sufficienty liberty to keep them in health.

If, instead of keeping large numbers together, they were scattered over the farm in small lots, a far greater total number could be kept and the tendency to disease much reduced.

People near towns with a limited space of garden or small piece of ground, should be very careful that they do not overcrowd, for in such places where there is no chance of a run over fields it is often very difficult to keep fowls in health, especially if they are on the same ground for years. By keeping no more than the space will hold, and by thoroughly cleaning and disinfecting all houses and runs at short intervals it may be done, and often times by strict attention and supervision good profits can be made.

Having said so much as to the chief means of preventing disease—plenty of space, liberty if possible, and thorough cleanliness—let us enter in more details in conection with this subject, which is most important to every poultry keeper.

I must confess I have very little faith in curing diseases of poultry, especially those of the more severe and contagious forms. Not that diseases cannot be cured; many of them can. But I find that a fowl that has had a bad illness is never the same again. There is always the danger of the disease breaking out again, and if bred from there is a tendency in the offspring to the same form of ailment. The eggs of diseased hens are not fit for food, and certainly the flesh is bad. What we want is thoroughly healthy and hardy fowls, and we cannot have these if we try to doctor up every sick fowl and breed from them. The best way is to get rid of sick birds as quickly as they appear, except in the case of simple ailments that do not seriously affect the constitution. Many a severe outbreak of disease, causing the loss of many fowls, would have been averted if the first birds attacked were killed and burned. I may say here in passing that burning is always the surest way to dispose of diseased fowls that are killed or that die. If buried maggots may make their way to the surface and be eaten by the fowls, probably spreading the disease.

But though I do not believe in trying to cure disease, I believe strongly in preventing them, and I also believe that most diseases that fowls are liable to can be prevented. Let us see how:

1st. By keeping none but healthy fowls.

2nd. By keeping their surroundings healthy.

3rd. By proper feeding and management.

To keep none but healthy fowls means that any that are reared must be bred from perfectly healthy parents, that never had any sickness, and that when birds are purchased inquiries should be made so as to ensure as far as possible that they have been always healthy. Besides this they should be placed in quarantine for a few weeks before being mixed with the other fowls. Oftentimes purchased fowls will develop disease by the change to a new place although when they first arrive they may appear quite healthy. Do not put them with the rest of the stock until they are carefully examined, after being left by themselves for a few weeks Even after this they should be watched occasionally, and if any of them appear sick the whole of them should be again separated. One cannot be too careful with purchased fowls, as by this means disease may break out through the whole stock. I have suffered myself severely in this way, and would warn all purchasers.

In the rearing of stock birds the chickens should be made as hardy as possible. There should be no pampering or coddling. Get rid of any delicate ones and keep none but the very best and hardiest for the breeding pens. But not only must we have healthy birds, but we must keep them healthy. The surroundings have much to do with this. The roosting houses must be well built, well ventilated, well lighted, and thoroughly clean. Remove the droppings every

Poultry and Eggs Wanted

SIX MONTHS TRIAL

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX MONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our ON TIME PLAN, and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—it will be mailed to you free.

Geo. W. Foott, Box 2040, Portland, Ore.

day, and keep the floor covered with peat moss or turf mould. If there is a tendency to damp, shake a little lime under it. The nests should be changed once a month, and a little sulphur or insect powder shaken into the fresh hay. The covered run or shed should be raked over every evening, and the scratching litter changed when it looks soiled. The open runs should be thoroughly dry by being properly drained, and should be raked and swept over every evening. Every part of the poultry yard and house should get a thorough cleaning and overhauling twice a year —whitewashing, disinfecting and burning rubbish. Powdered lime is a good thing to scatter over the runs when they have been dug and scraped over. Jey's disinfecting powder should be shaken in the roosting houses and covered runs occasionally. In fact, every part of a poultry yard should be kept so clean that neither the nose nor the eyes should be offended at any time.

The feeding should be of the very best description, and given in a clean and healthy way. Many diseases are propagated by the filthy way fowls are sometimes fed, throwing the food on dirty ground. Except there is a good clean grass run or field where the food can be scattered, troughs should be used, and these should be placed on green ground and in a way that the fowls cannot scratch it out. If the ground is not clean spread a piece of canvas over it, and on this put the troughs. Feeding troughs should be often cleaned.

Water is another fertile source of disease. Fresh water should be given every day, and the vessels well cleaned each time. I never use fountains. They are often only receptacles for dirt. A crock or other deep vessel easily cleaned is the best for water. It should be placed in a corner of the covered run, raised from the the ground, where the fowls cannot scratch dirt into it. Put a little iron into it in wet or very cold weather. Put a litle Epsom salts into it when the fowls seem out of sorts. Put a little camphor into it when disease breaks out.

EGG PRODUCTION.

A valuable lesson in feeding for egg production may be learned from nature. Fowls that are allowed to run at large and pick up their living about the ranch lay most of their eggs during the spring months.

Note the conditions that surround these fowls at this time; the weather is warm and there is plenty of food easily secured. This food consists of a mixture of grain and other seeds, green grass, clover, etc. The fowls get an abundance of fresh air and plenty of exercise, two important factors for egg production.

We should take the hint thrown out by nature and endeavor to make the conditions of springtime prevail throughout the year. Provide a cool place for the fowls in summer nad a warm place in winter.

Give them green food, grain, grit and meat when practicable, but above all provide pure air without drafts and plenty of exercise.

Corn alone does not form a good feed for laying hens, for it tends to the production of too much fat. If corn is allowed to form a large portion of the ration, a large amount of work must be provided. This may be supplied by scattering the feed deeply in litter so that the fowls must scratch for it.

Wheat forms a better food than corn, but a mixed ration is best. The fowls not only relish a mixed ration better, but such a ration will be more completely digested and assimilated than one composed of only one kind of food.

A ration made of corn, wheat, oats, barley, bran, shorts, clover or other green food, such as mangel wurzels, cabbage, etc., ground fresh bone and fresh meat scrap would, when properly proportioned, and varied from week to week, be excellent for egg production.

As to the proportions of the various kinds of food to use in making up a ration, space will not permit more than an illustration of the subject.

Pro. Wheeler of the New York State Experiment Station, suggests a daily ration made up as follows: Cracked corn, 1 pound; wheat, .75 of a pound; wheat middlings, .5 of a lb. buckwheat middlings, .5 of a pound; animal meal, .5 of a pound; fresh bone .66 of a pound; young, green alfalfa, .75 of a pound.

This forms a ration containing one pound of protein, 3.75 pounds of carbohydrates, and .35 of a pound of fat, and having a nutritive ration of 1:4.6; that is, 1 pound of flesh-forming food to an equivalent of 4.6 pounds of heat and fat-forming food.

This daily ration would be sufficient for 100 lbs. live weight; that is to say, it would feed twenty, five pound hens, or thirty-three, three pound hens.

At the Utah Agricultural Experiment Station the average of three years' experiments showed that Leghorn pullets consumed in a year 63.6 cents worth of food per fowl, and laid 167 eggs, which cost 4.6 cents per dozen and which brought $1.84. The profit from each hen was $1.20, or 188 per cent. on food consumed.—J. J. V.

CALIFORNIA POULTRY STATION.

The station is established in its own quarters on five acres of land in the suburbs of Petaluma; with an equipment of incubators, brooders, corrals and a cottage for the foreman.

There is at the present time going on at the station an experiment in feeding four lines of chicks, three of which are being fed different rations and the fourth being used as a control.

The objects of these tests is to find out which is the most profitable to feed as the main part of the ration.

Incubators are being started this week with the intention of running them throughout the year, in order that a special study may be made of the problems of incubation. We plan to fill an incubator with an accurate apparatus for automatically recording the temperatures, with a view to determining the possible relation between high temperatures during incubation, and mortality of chicks during the first few weeks of their life. This work is carried on by a foreman who resides on the station tract of land.

At Berkeley a large number of condimental, or proprietary foods are at present being examined, and upon completion of the analytical work the results will be published in bulletin form for general distribution.

Metabolism experiments will soon be carried on with the different nitrogenous foods ordinarily used bv poultrymen, in order to ascertain their digestion coefficient, and consequently their comparative physiological value as poultry feeds.

It is always best to have the hen yard large enough so that the grass will never be eaten down close, and by no means should the hens be compelled to run in yards all summer that are bare like the middle of the highway. If the yards are too small to allow any green stuff to grow, then sow some lettuce for them. It may be easily and quickly grown and is an excellent feed for both old and young poultry.

Poultry houses can be built in many ways, can be made cheaply or at great cost, just as you like, but we urge important points never be lost sight of; they should be on high ground so as to have dry floors, and they should admit the sun's rays during a considerable part of the day.

Coal ashes constitute a splendid grit for hens. Have you never seen a hen gobble down a half dozen chunks of cinders as large as the end of your little finger, as though they were choice bits of meat? Fowls will do this if they are in want of grit to operate on their digestive apparatuses.

KILLED BY THE FUMES.
You must kill the lice on the fowls some way. If you don't care to handle them singly, use our liquid
PRUSSIAN LICE KILLER.
Simply paint the roosts and drop boards with it. The fumes arise and kill the lice on fowl and pen. It catches them all to the last mite, and it takes the nit as soon as it comes to life. The fumes do the work. It is the perfect, easy method of protection and cure. But if you like the powder treatment better, don't forget the old reliable **Prussian Lice Powder.**
Enclosed please find 40 cents for another can of lice powder. We were well pleased with the first can, but we need and must have more.—H. F. Lake, Yankton, S. D.
Prices: Lice Killer, 50c and $1.00; 5 gallon can, $4.00. Lice Powder, 25c; by mail 40c. Remember also our famous **Prussian Poultry Food.** Get either of these from your dealer. If you don't find them write us at once. We will supply you and send you also our 68-page book.

PREVENTION OF SMUT.

An examination of a large number of samples of California-grown wheat shows a deplorable lack of attention to the prevention of smut. Farmers doubtless do not realize the large loss which occurs from this trouble. In a number of cases the samples have shown as high as 10 per cent of smutted grains—an amount sufficient to seriously affect the profit from the crop. This is more to be deplored since the methods which can be employed are both easy of application and extremely effective.

There are three methods which can be recommended as well nigh positive in result, when the seed has been properly treated. These methods are set forth below in the order in which they are recommended.

* * *

Formaldehyd Method.—Use one pound of formaldehyd (40 per cent strength, known as formalin) to 50 gallons of water. The solution may be placed in barrels or tanks until used. The wheat may be dipped into the solution in loosely woven bags or wire baskets, allowed to remain for ten minutes, and then drained to save all the liquid possible, and dried when it is ready to sow.

If it is preferred, the seed may be spread on a clean canvas or board floor and the formaldyhyd solution applied with a sprinkler, or hose and nozzle, constantly stirring and mixing the grain with a rake or shovel until all the kernels are thoroughly wetted, when it is allowed to dry.

Be sure to get 40 per cent formalin. Dealers sometimes give a 25 or 30 per cent formalin for a 40 per cent.

The formalin should be weighed in order to make sure that a full pound to each 50 gallons of water be used. The cans in which the formalin comes often contains only three-fourths of a pound, hence the necessity of this precaution.

This treatment has an advantage over some others, in that it is not poisonous to persons handling the material.

* * *

Bluestone Method.—This is the method practiced almost exclusively in California. Its lack of effectiveness in many cases may generally be traced to a lack of thoroughness in the work. The details of the treatment are the same as in the formalin method.

A solution is made by dissolving 1 pound of blue vitriol in 4 gallons of cold water, and dipping the wheat in the solution, as above, until the grain has become thoroughly wet, after which it is immediately dried. Or the wheat may be piled upon a floor or canvas, and thoroughly sprinkled or sprayed with the solution while the grain is being constantly shoveled over, so that every grain becomes wet over the entire surface. Care should be taken that the solution is of uniform density by thoroughly agitating just previous to use.

* * *

Hot Water Method.—Utensils Required.—1st, a boiler or large kettle in which to boil water; 2d, a vessel for cold water; 3rd, a vessel for water at 120°-132° F.; 4th, a vessel, barrel, or tank containing water kept constantly between 132° and 135° F.; 5th, a drying place where the grain is dried so it will pass through the drill or seeder; and 6th, an accurate thermometer to keep the temperature of the water within the above limits.

* * *

How to Proceed.—The vessels having been arranged and filled with water at the proper temperature, some convenient bulk of well-cleaned seed-wheat is taken in a loosely-woven bag and immersed in the first vessel containing water at 120°-132° F., keeping the wheat in constant agitation by moving the bag in the water, or by stirring the wheat. In about five minutes, when the seed will be well warmed and thoroughly wet, it is raised out and most of the water allowed to drain out, then immersed in the second vessel containing water at 132°-135° F., moving or stirring as before, and keeping close watch that the temperature does not fall below 132°. After twelve minutes it may be taken out and spread out to dry at some place where it will not be contaminated with fresh spores. When it is dry it may be sown. Some advise dipping in cold water at last, but that retards the drying, and should be omitted.

* * *

Cautions.—1. Keep the water in the first vessel well up to 132° in temperature, as the cold wheat will lower it rapidly.

2. Keep the temperature within the limits stated for the second vessel (which should be a large one), or the method will not give the desired results.

3. Be sure the thermometer registers correctly.

4. The seed-wheat will swell somewhat, and one-third to one-half more bulk of seed must be sown to remedy this result

GRAFTING AND BUDDING GRAPES

Continued from first page.

scion-bud. On a smooth part of the stock above ground a T-shaped incision is made through the bark, and the sides are raised with the haft of the grafting knife.

The scion is taken from a cane of the previous year's growth before the eyes start to burst in the spring, and preserved in sand until the time of grafting. The bud should be well constituted and healthy, but need not be at a particular state of development, as in the Salgues graft. The scion-bud is cut out as is done for fruit trees, but under the eye a thickness of wood is left reaching to the pith; and even a little of the latter may be left. This will give a scion about one inch long, with the inside section nearly flat. The bud is inserted and tied in the usual way. To insure knitting the shoots of the stock must be pinched short; the tie is cut one month after.

This graft may be made during the whole period during which the sap is circulating, and when the bark is detachable from the wood. The Vouzou graft has been very successful; 75 to 80 per cent of "takes" have commonly been obtained, and in one instance the success of 95 per cent was publicly demostrated. It is a simple graft and gives a perfect union. In case of failure it is easy to repeat it the same season.

The Kings and San Joaquin rivers have flooded over 20,000 acres of valuable grain and are still rising though now higher than for over twenty years.

Queries and Replies

ROBUSTA PALMS.

Editor Cultivator: I recently ordered from one of the leading firms of nurserymen in the State a number of W. Robusta palms for which they charge 50 cents a piece more than for W. Filifera of same size, 2-3 feet. In their list they distinctly state for W. Robusta "no filaments." The leaves of the young palms were just covered with long white threads. Yet on inquiry they persist that they are Robusta. Their statements cannot both be true. How can one tell a young Robusta palm so as not to be swindled. My own previous opinion was that the Robustas were nearly without threads.—P. C., Ceres.

Washingtonia robusta is very variable in appearance, especially in the amount of filaments hanging from the leaves. We know of one, in Dr. Bailey",s yard in Santa Ana that is of the extreme type of robusta, yet the leaves are the "hairiest"' of any Washingtonia in the State. The trunk and leaf stems of the robusta are darker than those of filifera and the green of the leaves is also darker, the leaf stems shorter, and altogether it is a neater and a cleaner palm. If you purchased them from a "leading firm" we believe you got what you paid for. With age the robusta loses its filaments.

HOSE PAINT.

Editor Cultivator: Will you please give me a formula for coating canvas irrigating hose; something that will be water-proof and not injurious to the hose. I have an alfalfa ranch that I irrigate in this way, and without a water-proof hose I lose so much water. Please let me know through the next issue of your paper and oblige—W. W.. Colton.

Mr. J. B. Neff states that he has made a very satisfactory paint for such purposes with boiled linseed oil and Prince's metallic, using it very thin, and in most cases applying two coats some little time apart.

STERILE BERRIES.

Editor Cultivator: I have 60 plants of Loganberries which in the 3 years of their life have never borne a berry, though blooming profusely. I can see nothing wrong with the blossoms; they seem perfect.—J. L. S., Los Angeles.

Loganberry vines are very subject to anthracnose and when they become affected with this they will bloom and produce very little or no fruit. In all likelihood your vines have this disease.

EASTER GRAPES.

Editor Cultivator: We hear much of some eastern grapes, but can you tell me if the following will do well in Southern California in general and in the Rialto—Cucamonga district in particular: Champion, Moore's Early, Pocklington. Salem, Vergennes, Worden.—E. B., Los Angeles.

We cannot recommend any of the above from experiments carried on at the Pomona Station. Out of twenty odd varieties, Niagara and Agawam were considered good.

WALNUT TROUBLE.

Editor Cultivator: Enclosed please find a walnut leaf with some kind of parasite. Will you kindly tell me what it is and give a remedy? Some of the nuts have black spots on them and the leaves look wilted and some of them are falling off. Is this the blight?—D. A.

We received the walnut leaf but could find no parasite, they evidently having escaped. The leaf is so dry and discolored that we cannot tell anything about it. Send one direct to J. W. Mills, Pomona.

The blight causes black spots on young walnuts and this makes the walnuts drop when they are small.

FOX TAIL.

Editor Cultivator: What is the best method of getting rid of fox-tail grass about the premises?—W. S. R., Corona.

The best method known to science is to get after it with a sharp hoe when small.

FROGS.

Editor Cultivator: Would a frog farm be profitable in the locality of Gardena, and where can information relative to starting this industry be had?—Mrs. G., Gardena.

Frog farms have been profitable and some have been failures. There are a good many things to contend with and returns do not come in for a considerable length of time after starting. Night birds are very destructive to frogs and a great many other things will interfere with the enterprise. Our advice would be to start a frog pond on a small scale and grow into the business. You will thus increase your stock with your experience.

You can get a stock of frogs from the edges of any reservoir in Southern California which has sloping sides.

ORANGES AND ROSES.

Editor Cultivator: I wish for some information in regard to roses and oranges and through the advice of a friend address you hoping that some of the writers or contributors to the "Cultivator" may help me.

I have a young orange tree also lemon that are badly infested with what I take to be black and red scale. I was advised to use kerosene emulsion but it seems to have no effect, can you tell me what to do?

I also have some roses that seem to be mildewed, the leaves and some of the young shoots being white and frosty looking. I have tried sulphur but with no results. Can you tell me the cause and remedy for this disease, as I suppose it is?

I also have other roses which have a yellow, rust-like, appearance on the under side of the leaves which after a time drops off leaving the bush bare and dead looking. The bushes are near no other plants and have been irrigated only once this season. so I do not think it can be too much water. The soil is quite heavy though well cultivated.

I should like very much to learn the causes of these diseases or whatever they may be and the cure for them if there is any. The neighbors and those I have asked do not know, though some of them are troubled the same way. This, I expect is encroaching on your time, but thought you would know of some authority on plants whom you might consult and if you would give this communication to such a one whom you may have on your staff I should be very much obliged.—P. T., Prospect Park.

Our advice would be to fumigate your orange and lemon tres with cyanide gas. You will have to fumigate more than once as the two scales have different characteristics and you must fumigate when the majority of the eggs are just hatched or between that time and the time when the scales are farther down.

You rose trouble must be controlled by fungicides. When the leaves are all off the bushes as you describe, drench them and the ground beneath with a solution of one pound of bluestone to ten gallons of water. Follow this with Bordeaux mixture when the young leaves begin to appear. During the following year spray with Bordeaux mixture about once in two months. After this, spray with the mixture twice a year. This treatment should clean up your bushes and keep them in good order; as a second safeguard against the powdery fungus, sprinkle sulphur under the bushes. This will be of no value, however, unless the temperature is 80 degrees or more.

JOHNSON GRASS.

Editor Cultivator: I am mailing to you, in separate package, a sample of grass that I have found growing in a new alfalfa field. Kindly identify and let me know in your paper whether it is objectionable or not, and oblige subscriber.—W. J. S.

The specimen sent is an awnless head of Johnson Grass (Sorghum Halespense). As to its value, that depends on the territory. We believe it should be considered a pest in all parts of California and vigorous measures taken to stamp it out. This is sometimes a hard task, especially in damp soils.

ONION SEED WANTED.

If L. N. G. had sent his name we might have published it and his address, together with the question as to where he could get some "of the big red sweet onion I saw growing in Sonoma county." Perhaps some of our advertisers may send in an answer that they have it for sale. 'L. N. G." (and others,) are hereby notified that we seldom depart from the rule of consigning all communications to the waste basket that are not signed in full by writer.

LAND TO LEASE

To Lease, for a term of years, 960 acres of improved land adjoining the town of **Brawley, Imperial Valley,** in tracts of from 10 to 80 acres. Part of this land is now in cantaloupes, remainder in barley, with hog and barb wire fencing. **Will provide necessary buildings and other permanent improvements,** will also furnish mares, cows and brood sows. Tenant must have necessary farming outfit. This is an unusual opportunity for the right man. Address

Imperial Investment Co. 315 H.W. Hellman Building Los Angeles, California

EASY TO PUT ON

a Permanent Protection

Save the expense of a professional roofer. Any man, any workman, with a knife, a hammer, an old paint brush and a little care can lay a perfect roof.

Pioneer Rubber Sanded Roofing

Is the best protection for any sort of roof. Tar melts, clogs the drain pipes, smears the building. Shingles warp, curl and split. Tin rusts rapidly. Metal roofs quickly become leaky. ***PIONEER RUBBER SANDED ROOFING*** overcomes all these difficulties. That wear-proof surface of hard flint sand adds years of wear to the roof. We will gladly send samples and prices. Booklet "D" will tell you all about the best roofing and building papers for every purpose. It is free.

LOVE OF COUNTRY.

Breathes there a man with soul so dead
Who never to himself hath said,
This is my own, my native land!
Whose heart has ne'er within him burned
As home his footsteps he hath turned,
From wandering on a foreign strand?
If such there breathe, go mark him well;
For him no minstrel raptures swell!

High though his titles, proud his name,
Boundless his wealth as wish can claim:
Despite those titles, power and pelf,
The wretch, concentered all in self,
Living, shall forfeit fair renown,
And doubly dying, shall go down
To the vile dust, from whence he sprung,
Unwept, unhonored, and unsung.

Sir Walter Scott.

CENTENNIAL ORATION.

(1876)

The conditions of life are always changing, and the experience of the fathers is rarely the experience of the sons. The temptations which are trying us are not the temptations which beset their footsteps, nor the dangers which threaten our pathway the dangers which surrounded them. These men were few in number; we are many. They were poor, but we are rich. They were weak, but we are strong. What is it, countrymen, that we need today? Wealth? Behold it in your hands. Power? God hath given it to you. Liberty? It is your birthright. Peace? It dwells amongst you. You have a government founded in the hearts of men, built by the people for the common good. You are a land flowing with milk and honey; your homes are happy, your workshops busy, your barns are full. The school, the railway, the printing press, have welded you together into one. Descend those mines that honeycomb the hills! Behold that commerce whitening every sea? Stand by yon gates and see that multitude pour through them from the corners of the earth, grafting the qualities of older stocks upon one stem; mingling the blood of many races in a common stream, and swelling the rich volume of our English speech with varied music from an hundred tongues. You have a long and glorious history, a past glittering with heroic deeds, an ancestry full of lofty and imperishable examples. You have passed through danger, endured privation, been acquainted with sorrow, been tried by suffering. You have journeyed in safety through the wilderness and crossed in triumph the Red Sea of civil strife, and the foot of him who led you hath not faltered, nor the light of his countenance been turned away.

It is a question for us now, not of the founding of a new government, but of the preservation of one already old; not of the formation of an independent power, but of the purification of a nation's life; not of the conquest of a foreign foe, but of the subjection of ourselves. The capacity of man to rule himself is to be proven in the days to come, not by the greatness of his wealth; not by his valor in the field; not by the extent of his dominion, nor by the splendor of his genius. The dangers of today come from within. The worship of self, the love of power, the lust for gold, the weakening of faith, the decay of public virtue, the lack of private worth—these are the perils which threaten our future; these are the enemies we have to fear; these are traitors which infest the camp; and the danger was far less when Cataline knocked with his army at the gates of Rome, than when he sat smiling in the Senate House. We see them daily face to face; in the walk of virtue; in the road to wealth; in the path to honor; on the way to happiness. There is no peace between them and our safety. Nor can we avoid them and turn back. It is not enough to rest upon the past. No man or nation can stand still. We must mount upward or go down. We grow worse or better. It is the eternal law—we cannot change it.

The century that is opening is all our own. The years that lie before us are a virgin page. We can inscribe them as we will. The future of our country rests upon us, the happiness of posterity depends upon us. The fate of humanity may be in our hands. That pleading voice, choked with the sobs of ages, which has so often spoken to deaf ears, is lifted up to us. It asks us to be brave, benevolent, consistent, true to the teachings of our history, proving "divine descent by worth divine." It asks us to be virtuous—building up public virtue by private worth; seeking that righteousness which exalteth nations. It asks us to be patriotic—loving our country before all other things; her happiness our happiness, her honor ours, her fame our own. It asks us in the name of justice, in the name of charity, in the name of freedom, in the name of God.

My countrymen, this anniversary has gone by forever, and my task is done. While I have spoken, the hour has passed from us; the hand has moved upon the dial and the old century is dead. The American Union endured an hundred years! Here, on this threshold of the future, the voice of humanity shall not plead to us in vain. There shall be darkness in the days to come; danger for our courage; temptation for our virtue; doubt for our faith: suffering for our fortitude. A thousand shall fall before us, and tens of thousands at our right hand. The years shall pass beneath our feet, and century follow century in quick succession. The generations of men shall come and go; the greatness of yesterday shall be forgotten today; and the glories of this noon shall vanish before tomorrow's sun; but America shall not perish, but endure while the spirit of our fathers animates their sons.—Henry Armitt Brown.

LIBERTY AND UNION.

I profess, sir, in my career hitherto, to have kept steadily in view the prosperity and honor of the whole country, and the preservation of our Federal Union. It is to that Union we owe our safety at home, and our consideration and dignity abroad. It is to that Union that we are chiefly indebted for whatever makes us most proud of our country. That Union we reached only by the discipline of our virtues in the severe school of adversity. It had its origin in the necessities of disordered finance, prostrate commerce and ruined credit. Under its benign influences these great interests immediately awoke, as from the dead, and sprang forth with newness of life. Every year of its duration has teemed with fresh proofs of its utility and its blessings; and although our territory has stretched out wider and wider, and our population spread out farther and farther, they have not outrun its protection or its benefits. It has been to us all a copious fountain of national, social, and personal happiness.

I have not allowed myself, sir, to look beyond the Union, to see what might lie hidden in the dark recess behind. I have not coolly weighed the chances of preserving liberty, when the bonds that unite us together shall be broken asunder. I have not accustomed myself to hang over the precipice of disunion, to see whether, with my short sight, I can fathom the depth of the abyss below; nor could I regard him as a safe counsellor in the affairs of this government, whose thoughts should be mainly bent on considering, not how the union should be preserved, but how tolerable might be the condition of the people, when it shall be broken up and destroyed. While the Union lasts, we have high, exciting gratifying prospects spread out before us, for us and our children. Beyond that, I seek not to penetrate the veil. God grant that in my day, at least, that curtain may not rise. God grant that on my vision never may be opened what lies behind. When my eyes shall be turned to behold for the last time the sun in heaven, may I not see him shining on the broken and dishonored fragments of a once glorious Union; on State dissevered, discordant, belligerent; on a land rent with civil feuds, or drenched, it may be, in fraternal blood! Let their last feeble and lingering glance, rather, behold the gorgeous ensign of the Republic, now known and honored throughout the earth, still full high advanced, its arms and trophies streaming in their original lustre; not a stripe erased or polluted, not a single star obscured—bearing for its motto, no such miserable interrogatory, as What is all this worth? nor those other words of delusion and folly: Liberty first, and union afterwards; but everywhere, spread all over in characters of living light, blazing on all its ample folds, as they float over the sea and over the land, and in every wind under the whole heavens, that other sentiment, dear to every true American heart: Liberty and union, now and forever, one and inseparable! —Daniel Webster.

A shiny or greasy skin can be benefited by dabbing with a sponge dipped in eau de cologne instead of using much soap and water. Being such a skin astringent, it is excellent for preventing acne.

MEANING OF OUR FLAG.

The flag for which the heroes fought, for which they died, is the symbol of all we are, of all we hope to be. It is the emblem of equal rights. It means free hands, free lips, self government, and the sovereignty of the individual. It means universal education—light for every mind, knowledge for every child. It means that the school-house is the fortress of liberty. It means that "governments derive their just powers from the consent of the governed;" that each man is accountable to and for the Government; that responsibility goes hand in hand with liberty. It means that it is the duty of every citizen to bear his share of the public burden—to take part in the affairs of his town, his county, his State, and his country. It means that the ballot-box is the ark of the covenant; that the source of authority must not be poisoned. It means the perpetual right of peaceful revolution. It means that every citizen of the Republic, native or naturalized, must be protected at home in every State, abroad in every land, on every sea. It means that all distinctions based on birth or blood have perished from our laws,

that our government shall stand between labor and capital, between the weak and strong, between the individual and the corporation, between want and wealth, and give and guarantee simple justice to each and all. It means that there shall be a legal remedy for every wrong. It means national hospitality—that we must welcome to our shores the exiles of the world, and that we may not drive them back. Some may be deformed by labor, dwarfed by hunger, broken in spirit, victims of tyranny and caste—in whose sad faces may be read the touching record of a weary life—and yet their children, born of liberty, and love, will be symmetrical and fair, intelligent and free.

That flag is the emblem of a supreme will—of a nation's power. Beneaths its folds the weakest must be protected and the strongest must obey. It shields and canopies alike the loftiest mansion and the rudest hut. That flag was given to the air in the Revolution's darkest days. It represents the sufferings of the past, the glories yet to be, and like the bow of heaven, it is the child of storm and sun.—Ingersoll.

THE LOVE OF COUNTRY.

Whence does this love for our country, this universal passion proceed? Why does the eye ever dwell with fondness upon the scenes of our youth? Why are not other soils as grateful and heavens as gay? Why does the soul of man ever cling to that earth where it first knew pleasure and pain, and, under the rough discipline of the passions, was roused to the dignity of moral life? Is it only that our country contains our kindred and our friends? And is it nothing but a name for our social affections? It cannot be this; the most friendless of human beings has a country which he admires and extols and which he would, in the same circumstances, prefer to all others under heaven. Tempt him with the fairest face of nature, place him by living waters under shadowy trees of Lebanon, open to his view all the gorgeous allurements of the climates of the sun, he will love the rocks and deserts of his childhood better than all these, and thou canst not bribe his soul to forget the land of his nativity; he will sit down and weep by the waters of Babylon, when he remembers thee, O Sion!—Sydney Smith.

HISTORICAL DATA.

The California Historical Department of the State Library is endeavoring to make a collection of all material issued by the various parties during the last political campaigns, such as ballots, broadsides, circulars, in fact material of all kinds printed during the campaigns that have occurred. Everything of this nature is of value to the historical department and if placed in their care will be preserved and made accessible to those who wish to study the political history of the State and the methods employed by the different parties to advance their interests. They hope that persons will donate to the State Library everything they may have that will assist in building up this collection, and if possible refer them to other sources where material may be found. The following circular has been sent out:

"Do not destroy books, pamphlets, newspaper files, manuscript narratives, dairies, public correspondence, or original documents of any kind which may throw light on the early history of California. The California Historical Department of the State Library can utilize them.

"Ephemeral publications such as broadsides, leafless tracts, circulars, programs, political dodgers, etc., present a faithful day-by-day picture of great interest and value. Old account books of early storekeepers, letters of pioneers, and diaries of original settlers should all be collected and kept. Anyone having such records will confer a great benefit upon future writers and students of California history by sending them to the California Historical Department of the State Library, Sacramento, to James L. Giles, State Librarian, where they will be carefully preserved and made accessible to the public.

HOW TO CLEAN JEWELRY.

Diamonds may be cleaned by brushing them with a lather of soap and water, rubbing them afterward with eau de Cologne. If well shaken in a bag of bran they acquire great brilliancy. Cut stones should not be wiped after being washed. Wash in a lather of white soap, rinse until quite dry. Opals which have become dim may be polished by rubbing them well with oxide of tin or with damp putty spread on chamois leather. Finish with damp powdered chalk, also spread on leather. Then wash the opals with a soft brush in water and then immerse in the following: Salt, one pint; alum, one pint; saltpetre, two pints; water four pints. Leave the opals in this for five minutes, then rinse in cold water and polish with a leather. They should be kept in silver paper. Oxidized silver can be cleaned in a quarter of a pint of sulphuric acid, mixed with one pint of water. Ordinary silver articles may be kept bright by cleaning them with a slice of lemon and afterward rinsing in cold water. Then wash in a lather of soap and rinse in hot water, dry with a soft cloth and polish with leather. Nickel should be rubbed with a flannel dipped in ammonia. Amber may be rubbed with wet powdered chalk, then with a little olive oil applied with a flannel. Ivory can be whitened with a solution of peroxide of hydrogen, or let the articles stand in spirits of wine in the sunshine.

SELECTION OF GLADIOLUS.

If you have gladiolus about the home and have no time to fool with them by emasculating and pollenizing to get more and better flowers, pursue one of two methods to get good seeds.

You may cut down and use in the house all you think are not first class, thereby removing them from a chance of their fertilizing the better ones. This you can do in the morning after the first flower opens. They all open at night and the pollen is not freed for some hours after.

If you wish to leave them pull the anthers out of the poor ones and insects will carry the pollen about among the good ones. The anthers are usually three in number and are from a half to three-fourths of an inch long, on the ends of wire-like filaments. Just take hold of these three and they easily break away. Leave the pistil, which is a three-forked organ. . Bees or other insects will carry the pollen from the anthers of the good ones and by sowing the resultant seeds about March you will have a new set of gladiolus of superior merit.

TO KEEP YOUR HANDS SOFT.

Equal parts of glycerine and strained lemon juice will make your hands beautifully white and soft if a little is rubbed in two or three times a day after washing. Leave it on ten minutes or a quarter of an hour, then wash your hands quickly in lukewarm water, using a good soap, and thoroughly dry. If your hands are inclined to be moist, rub in a very little lemon juice after drying.

Sterculia diversifolia makes an excellent street tree of medium size, but should be planted in good soil. If the trunks are injured by a horse they seldom recover, and often die.

BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

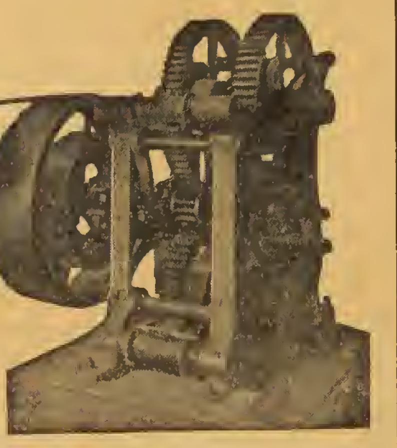
The Pomona Pump



□ The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas. Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

The Produce Markets

Los Angeles Markets.

Los Angeles, June, 27, 1906.—The local fruit market is very unsettled. While the season for drying fruits should be at its height, the cloudy weather has caused much of the fruit to sour. Several weeks of hot, dry weather would have a tendency to clean out the overstocked fruit market. The San Francisco market is unable to take care of the large supplies that are shipped to that city, and the surplus stocks are sent to this market, thus causing fruits of all kinds to be overabundant.

CITRUS MARKETS

NEW YORK, June 26.—During the past week an average of about 18 cars of oranges have been sold daily with the prices for first class stock very satisfactory. Navels have been in the minority with Sweets, St. Michaels and Valencias in good supply. Nineteen cars were sold at auction here today. The market is firm on good stock and the weather favorable.

Boston Markets.

Boston, June 26.—During the past week Navels have led, with Sweets a strong second. Mixed cars are common, sometimes outnumbering the "straights" two to one. The market has been falling a little each day. The arrivals are lighter. Two cars of Navels, two lemons, two mixed, one St. Michaels, and one car of Valencias were sold here at auction today. The weather is favorable. The market continues very much depressed.

FOR IRRIGATION By PUMPING

For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.

They are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.

Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

P. K. WOOD'S
Improved Deep Well Propeller Pump
FOR IRRIGATING AND MINING

After devoting several years to deep study and experiments, and the expenditure of many thousands of dollars, this pump has been brought up to the point where it is practically indestructable, has an efficiency not to be excelled, and is ready to try conclusions with any deep well pump on earth. The principal improvement consists of a screw guide inserted in casing coupling and a ball bearing placed in each guide, which gives absolute protection to all parts of the pump, regardless of the amount of sand or grit which the water may contain. Write for catalogue and full description of these important improvements.
